Index

VOLUME XXVII

OCTOBER, 1911—MARCH, 1912

The material in this index is arranged under authors and subjects and in a few cases under titles. Anonymous articles and paragraphs are entered under their subjects. The precise wording of titles has not been retained where abbreviation or paraphrase has seemed more desirable.

A.

- Abbott, Frank Frost. Common people of ancient Rome. (review), 1578.
Abbott, Lyman. America in the making, (review), 1909.

SOCIAL FORCES

BY THE EDITOR

PITTSBURGH IN PERSPECTIVE

Earlier, perhaps, than elsewhere, and more clearly than elsewhere, the essential tendencies of uncontrolled large-scale industry are to be observed in the Pittsburgh steel district. We have, however, constantly assumed that those tendencies are fundamentally national rather than local.

Through a generous gift of Charles M. Cabot of Boston, THE SURVEY has been in position to send John A. Fitch, the member of the staff of the Pittsburgh Survey especially charged with the investigation of conditions in the steel mills, to the other leading centers of steel production in this country. The intimate first-hand material which he has collected will serve to nationalize the earlier work of the Pittsburgh Survey, and will give a graphic social setting to the contemporaneous government investigation of which, of course, our inquiries have been entirely independent.

Mr. Fitch's Pittsburgh Survey data included the mill towns of the Monongahela valley where the United States Steel Corporation is dominant—Homestead, Braddock, Duquesne, and McKeesport. This data he set forth at length in the volume *The Steel Workers*, published by Charities Publication Committee for the Russell Sage Foundation. His second commission for THE SURVEY is undertaken, as we have indicated, in co-operation, not with the Russell Sage Foundation, but with a private citizen, who, as an individual stock-holder in the United States Steel Corporation, is carrying forward single-handed the campaign to provoke active interest and untrammelled discussion on the part of his fellow stock-holders as to conditions in the industry from which they draw dividends. The present inquiry has necessarily been selective. It covers the large independent mills in Pennsylvania; Lackawanna, the town built in a swamp; Gary and South Chicago, where the Illinois Steel Company is demonstrating that industrial accidents can be prevented; Pueblo, with its wonderful hospital system, and its wonderful disregard of law and human rights; and Birmingham, the center of the industrialism of the new South. An attempt has been made to seize in each district upon the unique characteristics—the features which differentiate it from others; yet, in spite of all, it is the constant factors that have insisted upon making themselves seen and felt.

What are these insistent, incontestable, and now clearly visualized constant factors of our steel industry? When the findings of the Pittsburgh Survey were presented in brief form in this magazine in January, February, and March of 1909, the public learned:

1. That two-thirds of the men employed there were unskilled laborers, earning what might be riches for an immigrant lodger but what did not provide decent family subsistence.

2. That a twelve-hour day and—for one steel worker in five—a seven-day week benumbed the faculties, blighted the family life, and destroyed the citizenship of the workers.

October 7, 1911.

917

3. That a system of bonuses to "pushers" and other forms of "speeding-up" added over-strain to over-time.

4. That the financial burden of industrial injuries—195 steel workers were killed in Allegheny County in the year of the Survey—fell mainly on the families of the killed and injured, thus adding poverty to bereavement.

5. That through discharges, spy systems, and other repressive measures, resistance to these conditions on the part of workers through collective bargaining or otherwise was eliminated.

When the government in 1910 found conditions in Bethlehem rather worse than those in Pittsburgh, Charles M. Schwab indignantly protested against the government report, not on the ground of its accuracy, but because his plant was no worse than those of his competitors.

What we find is that Mr. Schwab is, in the main, correct. Everywhere we have found long hours, over-time, Sunday work, and low wages. Striking advances we have found in the protection of employes from personal injuries. The Steel Corporation has devised a safety organization of remarkable scope and effectiveness—one with inspection which puts to shame the factory inspection of any of our state governments. In its relief plan, it has gone a long way beyond the demands of statute and common law in the states in which its plants are located. A movement away from the seven-day week is discernible, and at the same time open advocacy of the twelve-hour day. When the American Iron and Steel Institute this spring appointed a Welfare Committee, the members, according to President Clarke of the Lackawanna Steel Company, were fairly staggered by the size of the problem before them. This note of sincerity no less than breadth of outlook has characterized the statements given out as to the work which the committee has set for itself.

One constant factor, none the less, we have discovered in all the mills we have studied—a denial to the workers of a right to a voice as to the conditions of employment,—thus placing squarely upon the shoulders of directors and stockholders the full responsibility for the evils which they alone may prevent.

Obviously, Pittsburgh must not be crucified as monopolizing the abuses of unregulated industry. Having said nothing in haste or in malice, THE SURVEY cannot of course withdraw or extenuate what we have been constrained by a knowledge of the facts to set forth; but we are now prepared to pass from impressions, and known but fragmentary facts, to a demonstration that the evils which we found in the Pittsburgh steel plants three years ago are to be found in other great centers of the industry. Other steel districts are better in some respects than Pittsburgh was then; but so is Pittsburgh. What one might well have been excused for believing to be the lowest level proves to be very near the standard character of the industry. Nevertheless, steel may yet lead the great basic industries of the country in taking on a human character—a social spirit. Of this, too, there are signs.

THE COMMON WELFARE

KANSAS CITY NATIONAL CONSERVATION CONGRESS

From overflowing rivers to children is something of an excursion in nature, yet the trip was consistently taken by those who met at Kansas City, Mo., last week, to discuss the ways, means, and methods of conservation. The occasion was the third assembling of the National Conservation Congress, September 25-27. This was the most harmonious and most interesting conference yet held by this body. The hostility between the Pinchot and anti-Pinchot forces which showed itself so strongly last year at St. Paul never reached the surface at Kansas City.

In a much-applauded speech before the Congress, Dr. Harvey W. Wiley, chief chemist of the United States Department of Agriculture, advocated a federal health bureau, the director of which should sit in the president's cabinet. Speaking of public health he said:

There are persons who say that marriage is an affair of sentiment and that it is the business of none but those who contract the tie. But I say that marriage is an affair of state. If the state can give licenses to marry and say when couples may part I say that the state then has the right also to say who shall marry and to forbid marriages. The power of the state to protect its citizens from disease may be constitutionally exercised before as well as after birth.

Speaking of children as a public asset, he declared:

"The man who dilutes the milk waters the stock of the wealthiest company in the world."

At the conclusion of his speech, he said:

"Finally, in order to unify the national and state activities making for the public health, the establishment of a national department of health is almost a necessity. It is true that the wise physicians are in favor of the national department of health, not because it is a 'physicians' trust' but because it is for the good of the people. The department of health necessarily includes the function of education. Both of these offices have been recognized as a necessity and both are in existence. What is needed is to bring together all the

activities of the national government into one department having the prestige and power of presidential advisement. We are working most for a law that will provide for the establishment of a National Board of Health with real power. Its director shall have a seat in the President's Cabinet and shall have a right to say a word when he feels like it. That's coming after a while.

In his opening address President Henry Wallace put pithily the thing that makes conservation imperative to-day:

The nineteenth century farmer was, speaking generally, no farmer at all, but a miner, a soil robber. He sold the stored fertility of ages at the bare cost of mining it.

The very "root and kernel of our modern farm problem," he declared, "is how to retain on the farm all the boys and girls born there, who are fit to be farmers or farmers' wives. This can be done only by making farm life worth living."

He insisted that the two great important problems before the congress were the conservation of the fertility of the soil and the conservation of manhood and character standards in the country.

Neither the rural schools nor the rural churches measure up to their opportunities, said Prof. G. P. Holden, of Iowa State College.

Frequently the teachers are town girls without farm experience or sympathy. They do not interest boys and girls in the things of the farm and home; our present system educates away from the farm. . . . The rural church must be as broad as the rural community in which it exists. The minister should have as thorough a training in agriculture as in theology.

Speaking on The Country Boy vs. The City Boy, Judge Ben B. Lindsey, of Denver, advocated a children's bureau in the Department of Commerce and Labor. After reviewing recent steps taken in behalf of children he said:

The school free restaurant is as sure to come within the next ten years as the playground and recreation center has come in the past ten years. To say that the child is the chief asset of the state is short of the real truth. The child is the state; it is therefore futile to oppose the movement going on in this country for the conservation of child-

hood on the ground that it is parental. The state has got to be the over-parent. It cannot escape if it would; it would not escape if it could.

My own experience is that our public school education too often fails to equip children for earning more than most scanty wages. An opportunity between the sixth and eighth grades in our city schools to learn some kind of useful trades is a reform in our educational system which the champions of child labor must espouse if they would round out a systematic battle in this fight for the salvation of children. I want to see the time come when a boy from fourteen years of age up may be a valuable help to the plumber, carpenter, or printer at a decent wage, instead of going to the messenger service and the street. One of the saddest things in my experience has been the little fellows who have requested me to send them to the reform school that they might learn a trade. The principal of a school once said to me: "Judge, why don't you send that boy to a reform school so that he can learn a trade?" On behalf of the boy I replied: "In God's name, why don't you people on the board of education give him an opportunity to learn a trade at home?"

The objects of the congress, of which J. B. White, a wealthy lumberman of Kansas City, is the next president, are three-fold:

(1) To provide a forum for discussion of the resources of the United States as the foundation for the prosperity of the people; (2) to furnish definite information concerning the resources and their utilization, and (3) to afford an agency through which the people of the country may frame policies and principles affecting the wise and practical development, conservation, and utilization of the resources, to be put into effect by their representatives in state and federal governments.

N. Y. LOAN SHARKS UNDER BROOKS LAW

From an unusual source has come testimony of the usurious operations of the salary loan companies of New York city. A firm of lawyers retained by one of the daily newspapers to assist victims of the "loan sharks" who applied for help have reported on their work, which lasted nearly three months. During that time the lawyers settled 300 cases for people who had been in the clutches of loan companies for from six months to five years. The total principal borrowed by these 300 persons was \$8,290.60, and the interest which they had agreed to pay for this money for three months was \$3,744.71, or 180 per cent. The attorneys say

that in almost every case they were able to settle immediately with the loan company, by offering to pay back the original amount loaned with interest at 6 per cent a year.

The report states that in nearly all of the cases handled the original loans had been obtained for burial expenses or doctors' fees. This disagrees with the popular view that the borrower on a salary is usually a profligate or spendthrift. Others who have studied this matter believe that worthy borrowers constitute about half of those who apply to salary loan companies.

According to the report there are at the present time 116 salary and chattel mortgage loan offices operating in New York city. Others acquainted with the conditions have found as many as 150, and the number is believed to be even larger than that.

One month of the operation of the Brooks law, which was passed during the summer by the New York Legislature and which went into effect September 1, has served to demonstrate the inefficiency of some of its features. The passage of this bill was succeeded shortly by that of another, establishing

a commission to inquire into the workings of laws relative to certain loans commonly made at extraordinary rates of interest or charges, and to make recommendations for legislation.

The latter bill was vetoed by the governor because of the appropriation carried by it. The Brooks bill contains three notable features. It fixes 18 per cent as the maximum rate of interest for a salary loan. It makes into legislation the recent decision of the Appellate Division of the Supreme Court to the effect that before an assignment of wages of an employe can be valid a copy must be given to the employer within three days of the time the loan was made. The Brooks bill, indeed, goes a little farther than the court's decision by declaring that the date of the loan shall be deemed to be the day when the money is actually delivered to the borrower. Finally the bill provides that all salary loan companies shall, "on or before the first day of July next ensuing the passage of this act," file with the county clerk a sworn statement containing the names and residences of the

members of such companies and their places of business.

With the second of these features, which is in accordance with court decisions, no fault has been found by competent critics. Of the first it is said that it has been shown often, and that the brief history of the Brooks act adds to the testimony, that 18 per cent per year is too low a rate on which to conduct a salary loan business. The result is that conscientious companies are driven out of business and unscrupulous concerns, comprising most of those in the field, easily evade the law, which carries no enforcing clauses.

SEATTLE HOLDS COMMUNITY GATHERINGS IN HER PARKS

The use of the public parks for community gatherings has been successfully tried for a third summer in Seattle. A joint committee from two school civic centres obtained permission from the Park Board, which was gladly granted; and Kinnear Park was secured for a meeting every Sunday afternoon at half-past three o'clock.

The park rules prohibit meetings for religious or political purposes. The community meetings held in Kinnear Park were therefore of a civic character. They were none the less religious and political in the highest sense.

The last meeting on Labor Sunday was typical. The general topic was the Toilers of the City, and among the speakers were Paul K. Mohr, of the Central Labor Council, Rev. Wilfred Washington, ministerial delegate to the Labor Council, Max Wardall, president of the city council, and Rev. Joseph L. Garvin, president of the Ministers' Federation.

The gatherings have taken up such topics as the Juvenile Court, the Political Situation in Great Britain, the Child Welfare Exhibit, Recent Legislation, and What America May Learn from New Zealand. Among other citizens Richard A. Ballinger, Prof. E. O. Sisson, of the State University, and ex-senator George F. Cotterill have addressed the meetings.

One feature has been the telling of a story by Gertrude Andrus, of the Public Library, and by others, to the fifty or one hundred children who have grouped

themselves on the grass around the storyteller. The band of the Volunteers of America has gratuitously contributed its services throughout the summer.

The meetings have been in the open air; the people were seated on the grass, under the trees, in a natural amphitheatre. The attendance has averaged four hundred. Not a single meeting during July and August was interfered with by inclement weather. The report of the meetings found large space in the press. The total cost for printing, music, etc., was \$25. A song-sheet was used, containing half a dozen national and other familiar hymns, together with the Hebrew psalm, "I will lift up mine eyes to the hills," and Prof. Walter Rauschenbusch's Prayer for the City, in all of which the people heartily joined.

It is expected that the community gatherings will be organized in all the parks of the city in the summer of 1912. The committee in charge this season believes that the parks should be utilized during the summer as civic centres, in the same way that the school-houses are being utilized during the school year.

PRELIMINARY SOCIAL SURVEY OF SYRACUSE

East as far as Boston, Lawrence, and Trenton, and here and there through the country to Seattle, the cities, keenly alive to the value of self-knowledge, have taken some form of community inventory. A number have had "Know-Your-City" weeks and in others the social surveyor has been at work in extended fact-gathering. These investigations have presented new data and new interpretations of old data that have brought thinking citizens face to face with conditions under their own eaves which they have never pictured nearer than in their nearest big neighbor; and the week designated for thinking of community needs has been of value in following out the ramifications of bad social conditions in terms of vice, disease, ignorance, sorrow, and neglect.

In the last few months Syracuse has been preparing for such a week, the preparation taking the form of a preliminary social survey; in other words, it has been making a study of surface conditions to

see whether, and along what lines, a subsequent more extended survey might most profitably be conducted and whether any recommendations for action looking to immediate reform might be made.

The project was initiated from within—by Syracuse people—and the Ministerial Association, composed of over one hundred clergymen, was the organization which first took hold of the matter definitively. The Chamber of Commerce, the Trades Assembly, and the Associated Charities have united with the ministers, and the preliminary investigation has been kept in motion by a central committee of twelve—three members from each of the four organizations—under the chairmanship of Rev. Murray Shipley Howland, of the South Presbyterian Church, and the secretaryship of Paul Ilman, secretary of the Associated Charities. The field work of the investigation started in July under the direction of Shelby M. Harrison, who spent five weeks in Syracuse in a social "sizing up" of the city and in defining the lines along which the studies would be made. With the co-operation of local people who gave their time, and the co-operation also of outside organizations like the National Consumer's League, the New York Child Labor Committee, the North American Civic League for Immigrants, the National Committee on Prison Labor, all of which sent representatives to Syracuse, the preliminary survey was able to cover phases of eight separate fields—housing of the work-people and the poor; foreign populations, their opportunities and needs; juvenile delinquency; civic improvement and city planning; betterment agencies; sewage disposal; health conservation; and labor conditions.

The findings of the survey are to be made public in a "Know-Your-City" week of meetings beginning November 19. The week will bring to Syracuse specialists in the subjects above named and in others, who can speak from a broad knowledge of advance movements in other cities throughout the country. The proposed program starts with a religious day, when the ministers will be asked to preach on civic and social subjects; Monday, educational day, is to be devoted

to educational exhibits—literary, historical, and industrial—to the reading of prize essays on Syracuse by school children, and to addresses on city planning; Tuesday will deal with child welfare, housing, and immigrant peoples; Wednesday, welfare work in general, health and sanitation, and moral and social prophylaxis; Thursday, local betterment agencies—their possibilities for co-ordination and greater effectiveness—and industrial conditions; and Friday evening will close the week with a civic rally.

FACTORY INVESTIGATION HAS BEGUN IN NEW YORK

As a result largely of the Washington Place fire in New York last spring, the state legislature arranged for the appointment of commissioners to inquire into the conditions under which manufacture is carried on in the first and second class cities of the state

to the end that such remedial legislation may be enacted as will eliminate existing peril to the life and health of operatives and other occupants in existing and new structures.

The commission expects to recommend such new legislation as may be deemed necessary to overcome defects in the present laws and to govern conditions which are not now considered in the statutes and ordinances. In order to help in determining what specific recommendations to report to the legislature the commission, which has now begun its work, has decided to make investigations of the following subjects:

1. Hazard to Life from Fire. The inquiry under this head will embrace such matters as fire prevention, inadequate fire-escapes and exits, number of persons employed in factories and lofts, arrangement of machinery and fire drills.

2. Accident Prevention, including the guarding of machinery, and the inspection of factories and manufacturing establishments.

3. Danger to Life and Health, because of unsanitary conditions, whether due to improper ventilation, lighting, seating arrangements, or to hours of labor that are too long.

4. Occupational Diseases, such as industrial consumption, lead poisoning, and bone diseases.

The commission will also make an examination of the present statutes and ordinances that deal with these topics and will try to find out just how far they

have been enforced. The field of the investigation is broad and one of importance to all the employes of manufacturing establishments in cities throughout the state as well as to the general public. Recognizing this fact the commission has engaged H. F. J. Porter as expert on fire prevention, and Dr. George M. Price as sanitary expert to aid in carrying out this comprehensive plan of work. Frank A. Tierney is the secretary of the Factory Investigating Commission and Abram L. Elkus its counsel. In order to be able to perform its duties properly the commission has appealed for the help of those who from special study or practical experience are able to furnish suggestions that would be of assistance. Public hearings will be held in New York, Buffalo, Troy, and other cities. The first of these is to be in the Aldermanic Chambers, New York city, on October 10. All who can furnish information as to dangerous conditions in manufacturing establishments or conditions that impair the health and threaten the safety of operatives, or who can suggest methods for remedying present defects by legislation, are invited to attend the hearings.

PLEDGE METHOD TO REFORM DRUNKARDS

A declaration endorsing the pledge method of reforming drunkards was signed by 555 delegates and members of the Thirteenth International Congress on Alcoholism, which convened at the Hague, Holland, September 11-16. This plan of treating inebriates was first tried in the courts ten years ago by Judge William J. Pollard, of the second district court, St. Louis, Mo. It is now known as the Pollard system. The method is simply to release persons convicted of drunkenness and petty offenses arising out of drunkenness on condition that they sign in open court a pledge to abstain from the use of intoxicating liquors for one year. Its adoption is left to the discretion of the judge, and violation is met by enforcing the penalty originally suspended. The plan has been adopted by legislative action in Great Britain, Victoria (Australia), and Vermont. Judge Pollard states that of the thousands whom he

has bound in that way during ten years less than 5 per cent have forfeited suspension of sentence.

The declaration adopted by the congress, reads as follows:

We, the undersigned members and delegates attending the thirteenth International Congress on Alcoholism assembled in The Hague, (Holland) September 11-16, 1911, desire to record our gratification at the recognition in statute law by Great Britain, Vermont, U.S.A., and Victoria (Australia) of the principle of reforming drunkards by the probation on pledge method, commonly known as the Pollard plan. The possibilities of this wise and beneficent policy are so great that we desire to commend its adoption throughout the world.

The delegates to the congress came from twenty-one countries. The discussions dealt with legislative and judicial treatment of alcoholism and with the social and medical treatment of the inebriate. It is the aim of the Congress to discuss the nature and manifestation of alcoholism and to advance the fight against its evils.

EDITORIAL GRIST

CHICAGO VICE REPORT BARRED FROM MAILS

GRAHAM ROMEYN TAYLOR

Post office censorship to exclude immoral literature from the mails can be objected to by no right-minded person. But its application to a serious and scientific document prepared by an official commission to combat the social evil is to say the least ironical.

After allowing several hundred copies to go through the mails last spring, and another large quantity in August, the post office officials in Chicago have barred a thousand copies of the report of the Chicago Vice Commission.¹ The ruling is now upheld by a decision of the acting attorney-general at Washington. These copies were addressed, moreover, to public officials, sociologists, and others concerned in painstaking and practical efforts to control and reduce this social blight. Enlightenment as to

(1) See *THE SURVEY* for May 6, 1911.

the extent and exact nature of the evil and the ways it spreads—a facing of facts—is the first fundamental for rational action. This is provided by such reports as that from Chicago. Written in a plain, unsensational way, omitting names and all addresses, it is, as intended, a statement of actual conditions which must be known by those who would work intelligently. If the law prohibits the wider and thus more effective use of a tool designed to strengthen the hands of those struggling against the forces which violate the very law in question, it very obviously must be changed.

The Chicago Vice Commission has recently refused to place the "key" to the names and addresses omitted from its report at the disposal of civil service commission investigators of police collusion with gambling and vice. The chairman, Dean Walter T. Sumner, declares that the commission undertook its work, not to afford a basis for prosecutions, but to formulate a constructive municipal policy with reference to the social evil. To secure data for this sociological purpose the commission had promised informants that their names and testimony would be regarded with strict confidence. The continued existence of the commission as a private organization, independent of the city council and officials, is to be assured, it is reported, by incorporation.

LACKAWANNA'S OPPORTUNITY

JOHN DANIELS

Buffalo Secretary North American Civic League for Immigrants

The sad plight of Lackawanna has been talked about and talked about locally for years. When Buffalonians wish to conjure up a picture of the worst possible physical and social conditions, they utter the name Lackawanna. But now there is a different spirit in the air. At last people are beginning to talk about Lackawanna's opportunity. The opportunity has always been there, but hitherto has been so overlaid by grime as to be hardly discernible, and with such a glaring lack of ways and means of realiza-

tion as hardly to be considered practicable. But now the grime is being rubbed off in spots. In June, 1909, an event took place which made the opportunity practicable and immediate.

This event was the birth of the city of Lackawanna. Seldom has a city come into existence confronted by a harder problem, and seldom has a city had a more splendid opportunity. Both problem and opportunity may be summed up in the word "immigration." Will Lackawanna turn the opportunity into achievement? That becomes the leading question in the situation.

At the outset it is certain that all concerned—the immigrants, the various philanthropic individuals and organizations which are at work, the steel company, and the Lackawanna city officials—wish to improve conditions. This common desire for improvement is the most valuable asset at hand.

For the present the contribution of the immigrants themselves toward the amelioration of their own conditions must be the least. So inured are they to the only lot they have known that at first they may be expected to misunderstand and even to resist the efforts to help them. But as each improvement takes place they will become better able to take care of themselves, and that is the principal result for which to strive.

As for the philanthropic individuals and organizations whose activities Mr. Fitch has mentioned, they merit the highest commendation as blazers of trails and openers of the way. But that is the most and best they can do. For, if instead of showing the needs and the ways of meeting them to the city authorities they attempt to meet these wants themselves, they will accomplish but a puny mite.

That the steel company has a tremendous and fundamental responsibility in the situation cannot be questioned. It brought the immigrants there and it keeps them there, ever reinforced by newcomers. The hours and wages it decrees practically determine the level of the immigrants' lives. So long as a large proportion of its laborers toil twelve hours a day, seven days in the week, with twenty-four hour stretches every other week, these laborers cannot be more than

beasts of burden with brutish lives. Unless the steel company interests itself in improvement in a thorough-going way, improvement will be slow and well-nigh impossible; but if it does so interest itself, the improvement effected will be rapid and sure. That it is at least taking active steps toward betterment is a most hopeful element in the situation. But though the just responsibilities of the steel company are great enough and far-reaching enough, still it is neither a philanthropic institution nor a city government.

The city of Lackawanna: there is the agency which legitimately should deal with the situation and which possesses the power to treat it in a permanent and adequate way. This is the conclusion to which even a little thought leads one, and this is the premise on which all steps to better Lackawanna should be based. What, then, is the course which Lackawanna should adopt?

One-third of the residents of Lackawanna are Americans (as the term is used); the remaining two-thirds are recent and non-English-speaking immigrants. Manifestly, therefore, if this city is to realize its own potentialities, there is no other course open to it than to work out a well defined policy and build up an efficient machinery for Americanizing and assimilating its immigrant citizens. Over and above the regular activities of a city government, it must direct its energies to this special task.

The conditions and the needs are so clear that the measures required are easy to see. The Lackawanna department of public works is already taking the first steps. It is paving the principal thoroughfares, extending sidewalks, opening a sewer, draining the swamp, and trying to have the swamp land filled. But eventually—and the sooner the better—it must tackle the tough problem of correcting, so far as possible, the miserable lay-out and ramshackle structure of Lackawanna which Mr. Fitch describes, and of insuring a more satisfactory future development of the city. To this end, many buildings now standing will have to be condemned and torn down, all further building closely regulated,

new streets laid out, sites provided for new extensions, and suitable public buildings erected.

To guard its health, Lackawanna has a health officer and *one* assistant—and this with approximately 10,000 immigrants living in the most unsanitary conditions! The health officer told me that if Lackawanna had as many health officials in proportion to population as Buffalo—and Buffalo is under-supplied—it would have *six*. Certainly six should be a working minimum. At present only complaints can be attended to. Routine inspections of living quarters are practically impossible. Inspection of foods, eating places, saloons, bakeries, meat markets, etc. is impossible. Such inspection is needed. Beyond this some positive and constructive plan of educating the immigrants in matters of health should be undertaken.

The chief problem with which the departments of police and law should concern themselves is that of reducing the saloon evil. There are approximately 200 saloons in Lackawanna, which means one to every seventy-five of the population. Though it is a matter of common report that these saloons constantly violate the law by selling after hours, on Sundays, and to children, as yet not a single saloon has lost its license. That this is so is a disgrace to Lackawanna. The police should do their part and the court its part to end this disgrace. There are at least twice as many saloons as could exist if the law were enforced.

The other matter which the department of law must attack is the system of exploitation of immigrants which flourishes in Lackawanna. A number of "crooks," including several "men higher up," are making this contemptible work their business, and thus far with impunity. Every public official of Lackawanna should assist the court in ridding the city of these rascals.

But the most vital work of all must be done by the department of education. For though much can be accomplished to uplift the present generation, vastly more can be done to make the condition of the rising generation better, and what will surely accomplish most in this direc-

tion is the education of both generations. "Education, education, still more education," might well be adopted by Lackawanna as a battle-cry for the coming civic campaign. For it is education which will transform the immigrants from a dead weight or worse into intelligent active citizens.

Strict enforcement of school attendance is the first necessity. Evening schools, with chief attention to instruction in English and citizenship, are the next need. The school officials should not merely wait for the immigrants to come. The evening schools should be advertised widely, and in all possible ways the immigrants should be persuaded to come. Industrial education of the most practical sort should be provided, modeled, perhaps, after that of Buffalo's excellent vocational schools. Nothing will sooner enable the immigrants to live better than fitting them to earn better wages.

These suggested measures at least indicate the direction of the campaign of civic betterment upon which Lackawanna should enter. There is nothing novel about these measures. They are not the proposals of radicals, theorists, socialists, or of any other dubious breed. They mean simply the common-sense adaptations of Lackawanna City's activities to Lackawanna's special needs. All these things cannot be done at once, of course; but a start toward doing them can be made immediately. Are there any good reasons for delay?

Lackawanna's mayor and council and other officials are not to be commiserated upon their difficulties, serious as these are. They are to be congratulated upon their opportunity.

THE ALL-SUMMER BOYS' CAMP

ROBERT A. WOODS

Headworker South End House, Boston

It is getting to be a common-places that every city child should be provided with some experience of country life during the summer. In some cities practically every child actually has such an outing of at least ten days or two weeks.

The physical and moral gain which comes from even so much of mere contact with nature is impressive to all who watch its effects. When the vacation is carefully and sympathetically directed the results are found to be doubled or trebled. When this direction is in the hands of those who are close to the children throughout the year, and when the summer outing fills out one year's work and influence and merges into another's, the summer, instead of being a time when everything sags, becomes the pivotal point in the club worker's calendar. Every person who has had the experience even once knows what a rare awakening it is when one leaves behind conditions which seem to interpose many barriers between him and his boys, and passes to a new and altogether strange environment in which he and they suddenly find that he is father and mother to them all.

The unusual possibilities that lie in such summer outings have suggested the far-reaching gains that could be secured from all-summer camps in connection with settlement clubs. Hale House, Boston, has done important pioneer work with its all-summer camp at Squam Lake, N. H. On another page of this magazine is told the story of the all-summer project of the South End House for some sixty of its boys.

The all-summer camp is in the nature of the case not for all. Any such proposal would be economically impossible. Every city ought, however, to be making its experiment in this direction. A most suggestive basis for selection of the members of such a camp would be that of some proved capacity for leadership. A group of boys brought together on this basis, from different social centers; organized into a system which would elicit and guide their power of initiative; infected while in a peculiarly susceptible and educable state of mind with fine and appealing civic and moral standards; weighted with regular and substantial responsibilities on which their own and the group's well-being shall depend; retained as members of the camp for several years with the chance of increased opportunity and influence; and all brought together for occasional group meetings and kept under stimulating influences throughout

the winter in the city, might easily mean a succession of young citizens coming forward to be such leaders of the people as at present we only vainly hope for.

For the administration of the camp young men would be needed who should exemplify what the camp stands for; but a camp standing for such purposes could get the young men. The problem of co-ordinating its work with that of the different social centres represented by the boys and of re-enforcing their influence upon the boys during the winter by the loyal spirit of the camp would have fresh and suggestive interest.

Those who for a number of years have followed these two all-summer settlement camps, as well as the rapidly growing number of educators who are conducting all-summer school camps, will agree that the possibilities here outlined can hardly be too deeply emphasized. In England, for two or three decades, there have been all-summer camps, connected with the great boarding schools, at which the boys are in close and continued association with the most inspiring men. It is recognized that the life of these camps has had a profound, if not a determining, influence upon the careers of a considerable number of those who, in different pursuits, are today upholding the best standards of English civilization.

The Bretton Woods caddy scheme suggests that every golf club has a responsibility to the boys in its employ which is rarely fulfilled. An organization has recently been formed among golfers in England and Scotland for the formation of boys' clubs for caddies. The Northwestern Settlement in Chicago has entered upon the experiment of providing the caddies for a suburban golf club, the boys living in tents beside the links, under the care of young men from the settlement.

DISTRIBUTION OF AGRICULTURAL IMMIGRANTS

One of the first problems of the conservation of the agricultural industry is the maintenance of a wholesome, happy rural population. Upon the character of the rural people—their intelligence,

morality, ideals, and material well-being—more than on any other one factor depends the general welfare of the nation as a whole. A second but less important problem is the conservation and efficient utilization of natural resources, the restoration and maintenance of soil fertility. With these two problems the question of immigrant distribution is very closely interwoven.

Rightly settled, even on mediocre land, the foreigner from the agricultural districts of the old world has proved his capacity for agricultural development as well as for rural citizenship in a hundred instances. Under present conditions the capable hard-working foreigner with his family is able to out-compete the industrious American, with a smaller family, a higher standard of living, and a stronger desire for the "appurtenances of leisure." The ultimate settlement of rural New England by foreign farmers—Italian, Slavic, Hebrew, perhaps Teuton—seems inevitable. Gradually they are dotting the rural districts with their farms, slipping quietly but surely into the homes vacated by native New England farmers. The movement has up to the present been sporadic, unorganized, geographically scattered, and officially unrecognized—though it has been going on in the East for about twenty years.

State departments of agriculture in the East have been strangely blind to any duty or responsibility in the matter of immigrant distribution. Maine and New Jersey have taken occasion in their reports to describe and praise the industry, thrift, and foresight of certain large colonies settled within their borders. New York maintains a sort of bureau of immigration, but so far from rendering any material recognition, aid, or assistance, they have held it no part of their business. The federal authorities consider their duty well done when they have safely landed the newcomers in New York city. With very few exceptions privately organized colonization companies have been formed with a single eye to personal gain, regardless of the present or ultimate well-being of the colonized; of public colonization schemes there are none.

The results of this haphazard, devil-may-care method of settling our worn-out lands may be seen by any one who cares to investigate—even casually—the scattered foreign farm communities in New England. Exploitation by real estate agents, settlement on unprofitable soils, fruitless endeavor to wrest a living from exhausted acres, discouragement, disappointment, economic disaster are the too frequent accompaniments of this form of settlement.

The essentials of successful immigrant occupation are a fairly compact settlement in groups large enough to maintain a church and perhaps a school; land sufficiently fertile to produce the staple crops; capital to purchase a minimum equipment for the type of agriculture adopted; day-labor or some other immediately available form of income to enable the foreign settler to support his family until his farm becomes self-supporting. Let the foreigner pay for his purchase not more than 25 per cent above its productive value, and nine times out of ten he will win out on these terms. As long as New England or any other region permits the exploitation of the rural immigrant for private gain, the results of immigration will be disastrous both to agriculture and to the foreigner.

But beyond assistance in settlement and information concerning the character, uses, and values of farm land which every State Board of Agriculture should make easily and practically available to all home-seekers, it seems reasonable that the state colleges of agriculture and experiment stations should put their foreign-born farmers and prospective citizens in vital touch with the best methods and materials of agriculture. Successful agriculture in New England is specialized, intensive, and commercial. Careful preparation and tillage of the soil; selection of seeds; selection, mixing, and application of fertilizers; up-to-date methods of preparing, packing, handling, and marketing the products of the farm must be studied carefully and continually. The colleges have this information; it is free for the asking, but the immigrant knows nothing about experiment stations and a

bulletin in English is a sealed book. Massachusetts Agricultural College is one of the first, perhaps the only one, of the state colleges to recognize and make such provision, in a small way, by inaugurating a Polish-American "Farmers' Day," in the spring of 1911, for foreigners in the Connecticut Valley onion and tobacco district. Seventy-five Polish farmers visited the college, inspected the plant, listened to practical talks delivered through an interpreter, and asked questions on onion culture, dairy feeds, and good citizenship. No body of men who come to that college listened more eagerly or derived more benefit from a day's instruction than those Polish onion growers. But this is only a beginning.

Perhaps the nearest approach to an ideal method of supervised colonization is that of the Carolina Trucking and Development Company at St. Helena, N. C.,¹ where the promoters build the houses; sell the land on easy terms; provide work for the newcomers at fair wages; buy the timber cut from the individual clearings, at a remunerative price; provide expert farmers who teach the settlers in their own tongue how to clear the land, prepare it, plant the proper seed, and care for the crop in the most approved fashion. The company further gives personal and expert attention to the marketing of the perishable truck crops raised, and maintains an experiment station for the determination of practical methods, plants, and fertilizers, the results of which are at once communicated to the foreign farmers for whose benefit the station exists. The scheme is elaborate and detailed, but it seems likely to prove profitable and to result in a few years in a semi-foreign community of very superior small landowners, settled on land made valuable by their own intelligently directed industry.

The day is coming when the needs of the south-European farmer in the Eastern states must be recognized and ministered to by our federal and state institutions of agriculture in some such far-reaching, definite, systematic, and intelligent manner.

THE HUMAN SIDE OF LARGE OUTPUTS STEEL AND STEEL WORKERS IN SIX AMERICAN STATES

I

LACKAWANNA—SWAMP, MILL, AND TOWN

JOHN A. FITCH

MEMBER STAFF (1907-8) PITTSBURGH SURVEY

Ten years ago—five years before a spade was turned at Gary—the Lackawanna Steel Company came up from Scranton, Pennsylvania, and began building a steel plant on the shore of Lake Erie just south of the city limits of Buffalo. It was a good location for a steel plant on account of the facilities for transporting iron ore from Lake Superior mines direct by boat and without rehandling; but it was a poor site for a town. About a mile in from the lake the railroads connecting Buffalo with the West and South run in a broad highway of steel. The belt of land thus cut off between the tracks and the shore line is low and for the most part swampy. Transportation facilities for taking people in and out of Buffalo are poor.

But there was, nevertheless, one overwhelming advantage at the outset—the town that must inevitably grow up around the plant had as good a chance to grow right as did the plant itself. It could have been planned with equal care in advance of bidding for work-people. The

steel company could have employed landscape architects and municipal experts as well as construction engineers, and laid out a town designed to overcome the physical disadvantages and also the mistakes of decades and centuries, which, in other municipalities, clothed with all the dignity of vested rights, are obstructing progress and burdening the people.

The steel company sees that now and is trying to correct its earlier mistakes. But it did not see then. It employed experts to build the plant, but, except for two clusters of company houses, let the dwelling places of its newly gathered working force grow mushroom-fashion as they pleased. So Lackawanna, handicapped by its site and by lack of leadership, has developed in the usual blind, stupid way of growing communities into unusual misfortunes. More than ordinarily, the building of the town was a "botched job."

A job of that sort has far-reaching effects. It is more than a question of esthetics. Health and prosperity and

morals are intimately bound up with the planning and manner of growth of a town. Let us take a look at the place as it stands today.

Down through the very middle of the community extend the lines of the Lake Shore Railroad, two lines of the Pennsylvania, the Nickel Plate, Buffalo and Susquehanna, the Erie, and the Lehigh Valley. In all, they form a great barricading road-bed with thirty-five to forty different tracks, splitting Lackawanna into two parts. As you stand on the single high bridge which spans the tracks and connects the two parts, it comes home to you that here is no town at all, but a confederacy of villages; for not only is its site thus cut in two, but in the strip to the lakeward of the tracks, shut in from the lake by the sheathed walls and grim stacks of the steel plant, there are practically three distinct and uncorrelated neighborhoods. These groups of houses are shunted off from each other by a central swamp of practically stagnant water, foul with unspeakable accumulations of all sorts.

Town life depends on cohesion, and, although Lackawanna officially became a city in 1909, swamp, tracks, and mill yard are so many barriers to its developing into a real community. A dwelling-place split up as this one is involves administrative difficulties and affects personal comfort and well-being in countless ways.

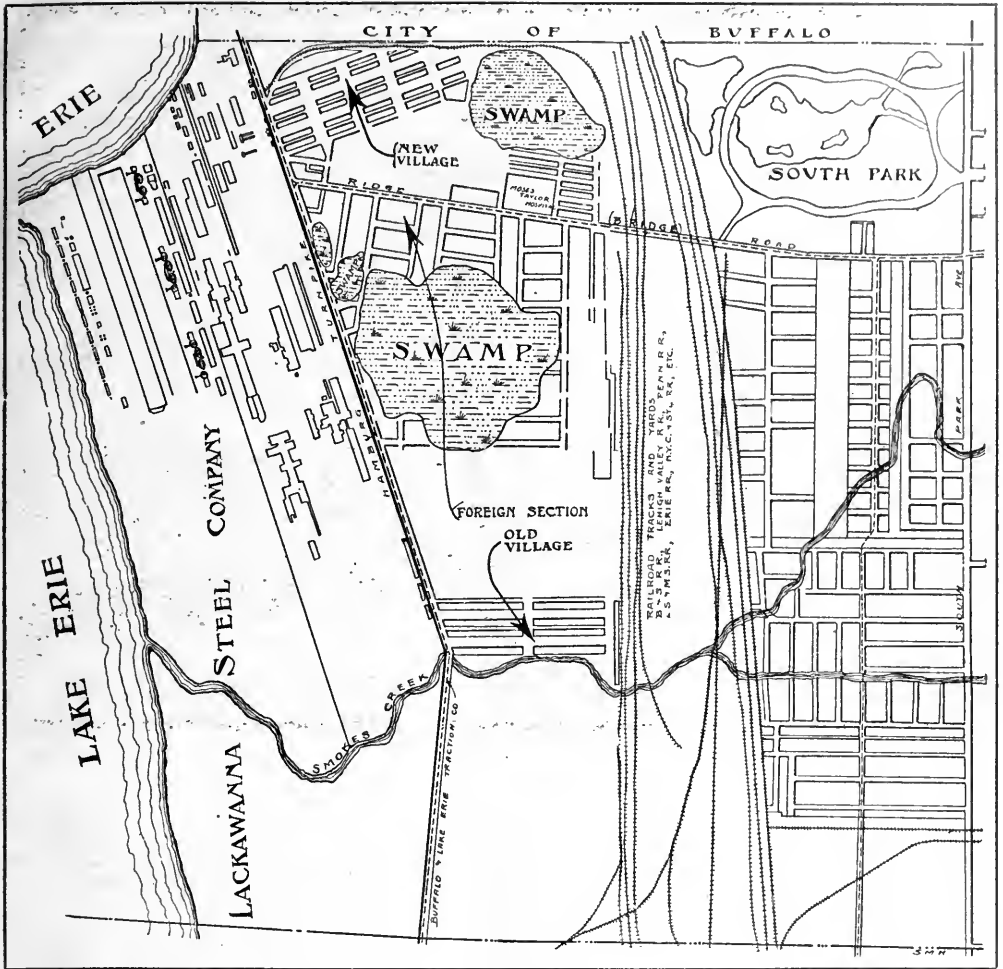

For example, the bridge referred to is the only one by which you can cross the railroads. Through all the rest of their extent between the homes in the east and west sections there is not a single highway from one section to the other! Since there are no highways, there are no gates and no flagmen. The trains do not abate their speed to any appreciable extent, and if a workman wishes to make his way across that maze of tracks, on his way to work, he takes the risk of being run down by any one of a hundred "limiteds."

There are a good many workmen living in this east section; it is mostly a residential district with detached houses and ample unoccupied areas, giving light and sunshine free play. But this very ampleness of living means that some of the workmen live more than a mile south

of the bridge, although their houses may be nearer than that, as the crow flies, to the mills themselves. If there were a direct bridge or a subway they could easily walk to work. Now they may either risk their lives on the tracks, twice a day, as many do, or they may take the street-car—which runs every half-hour—and ride one mile north to the bridge, another mile west to the steel works, and then as much farther south again as may be necessary to get to where their work awaits them.

Many of the skilled men, consequently, prefer to live in Buffalo. To and from Buffalo, however, the workaday transportation problem is only a little less difficult. It was on a November day in 1910 that I first saw Lackawanna. I got onto an interurban car at Lafayette Square, Buffalo, and after turning numerous corners and crossing a bridge or two, I found we were running south through a region of warehouses, factories, and shops, not far from the shore. Then the steady flow of buildings, on the right, suddenly stopped, the blue waters of the lake appeared, and we were traveling close to the water's edge. It was a windy day and the waves were dashing over the government breakwater, which extends far to the rear, in white spray. When we had crossed another bridge, the conductor called out, "Lackawanna, five-cent-fare limit!" and I, being economical as well as desirous of looking at Lackawanna from the ground, got out. I was on Hamburg Turnpike, West Lackawanna. The turnpike parallels both plant and railroad and connects the scattered village groups I have spoken of; while intersecting it at right angles, and crossing the sole bridge to East Lackawanna, runs Ridge Road—names which in themselves indicate how recently the neighborhood was rural.

Ridge Road appeared to be something of a business street, and south from it the turnpike also manifested business proclivities; all the same kind of business too, I found—all designed to furnish liquid refreshment to the mill-worker. Such alluring signs as "Workingmen's Rest," or "Pay Checks Cashed Here," adorned the windows. It looked to me like a poor place for anyone to rest. The

STEEL MILL, SWAMP, AND TOWN.

saloon buildings were big, gloomy barracks, two and three stories high, absolutely uninviting. Across the street were the grimy smoke-stacks of the mills.

On my right, as I stood after alighting from the car, was the office building of the Lackawanna Steel Company, a substantial two-story structure in the foreground of the big plant. On the left was a group of houses which I learned afterward belonged to the steel company, and which is known as the "New Village." The houses are of pleasing design and are mostly detached, single and double. On later inspections, I learned that they have from six to eight rooms to each apartment and

are provided with hot water, furnaces, and electric light fixtures. The rent is \$16.50 for apartments in the double houses and \$19 for the single houses. These houses are all provided with bathrooms and the residents appear to be well satisfied. The rent is lower than would be charged for the same accommodations in Buffalo. Here, without doubt, the efforts of the company to attract and hold a group of workers within call of their lake shore plant had been at their best. The families are chiefly those of skilled workers. It remained to see the shelter within reach of the low-paid men who make up the great bulk of the force in all steel plants.

OPEN SEWER FLOWING INTO LOT ON "THE AVENUE," LACKAWANNA.

Just south of these houses, but belonging to the same group, was one long brick row, presenting an unbroken front to the street and containing apparently ten or fifteen separate apartments. Beyond this group was the boarding-house section, not controlled by the steel company, of which I shall have more to say shortly; and on a higher piece of ground a half-mile in the same direction appeared another group which I identified as that famous in Buffalo and vicinity as the "Old Village."

I started toward these other groups of houses, walking beside the mill fence. For some distance there was a sidewalk, but it ran out and I picked my way as best I could along an unpaved road, deep with mud, with here and there a pool of water, or of mud a stage or two nearer liquid than the rest of the surface. I was soon passing the saloon-boarding-house section, where, through a break in the row, the swamp at the rear opened up to view, and I could see that many

of these buildings and private houses also were built half over the water. A little farther on two or three more saloon buildings were built apparently entirely over the water. Back of them, and far to either side, extended this unsightly swamp, perhaps a half-mile long and nearly as wide.

The "old village," like the "new," is owned by the company. It was rather an amazing spectacle as I saw it for the first time. It consists of seven brick rows, a story and a half high, six extending with unbroken front, one after the other, and the seventh heading them off at right angles with its back yards close to the railroad tracks. Each row is as long as two ordinary city blocks and contains twenty-four to twenty-eight separate tenements. Each apartment has four or five rooms. Nine have bathrooms, but each is provided with inside toilet. The four-room apartments rent for \$6.50 a month and the five-room ones for \$7.50. Sanitary conditions are ex-

Photograph by George J. Hare.

SWAMP AND BOARDING HOUSE.

cellent, and the houses appear to be fairly well built. But instead of there being a waiting list of people anxious to get these exceptional accommodations for the low rentals paid, there were over a hundred vacant apartments in November, 1910. The tenants were foreigners, Negroes, and the more poorly paid Americans.

Getting onto a car I rode back to the boarding-house section and walked through it on wooden sidewalks, which occasionally between buildings were built up on stakes over two or three feet of water. Some of the planks were rotten, and there were no railings. I should think it would require careful navigation on a dark night—especially if one were returning from the "Workingmen's Rest."

Here, between the two company villages, in this swamp community of private property on stilts, there was most obvious evidence of the sudden growth of Lackawanna to meet a sudden need.

In Homestead, in Johnstown, and other steel centers where the town has grown slowly with the industry, the lodgers find accommodations in ordinary dwelling-houses. In Lackawanna, two- and three-story barracks were erected in anticipation of the demand for lodgings, with sleeping rooms on the upper floors, and on the first floor the inevitable saloon.

In these saloon-boarding-houses there are often two or three different "boarding-bosses," sometimes one on each floor. The saloon-keeper sub-lets the rooms to the "bosses" and they, in turn, provide food and lodging for the roomers. In one boarding-house there were five beds in one room. In another place, which was conspicuously untidy in every respect, a man was found sleeping in a little room across a hall from the kitchen. This room was also a storage room for various supplies; a dressed pig hung in one corner, while other meats were piled on shelves. In a few instances it was

found that the beds were being made to do double duty, one set of men occupying them at night and another during the day. My visit, however, was at a time when for some time the mills had been "running slack." Many workmen had gone elsewhere looking for work, and there was not, consequently, the degree of congestion that is often found in such communities. In several houses there were unoccupied rooms and in others whole floors were without occupants. But with the return of prosperity and rush orders in the mills, there would again be congestion in the boarding-house district.

I was told that a majority of the houses in this section are owned by foreigners who are paying for the property by filling their houses with boarders. The high price of building lots was given also as a reason for the building of tenement boarding-houses and the location was explained by the fact that the swamp land is the only available property near the plant; the steel company had bought up the higher land for its two villages and let the low land get into the hands of private speculators.

We have the situation, then, fairly before us. The steel company made a definite effort to provide dwelling-places for some of its employes, when it laid out its plant on this untenanted lake shore. In its "New Village" it outdid what commercial real estate companies offer to better-paid wage-earners in Buffalo; in its "Old Village" it offered better household conveniences than are within the reach of common laborers who deal with petty landlords. As we shall see, it provided both with a sanitary equipment in sharp contrast to the inadequate arrangements which the lax town government has constructed for the neighboring areas. But the company failed to grasp the idea that it was creating a community and must plan for it as a whole. These two disjointed groups together house not over a third of the households of Lackawanna. The homes of the more resourceful work-people have spread out in a leaderless fashion to the landward of the railroads, their domestic traffic and their natural daily travel to

and from work impeded at every point by physical obstacles outside the control of the individual family and today outside the control of the company itself; while the half-inundated building sites nearest the mill—rendered desirable by these very obstacles, but the worst in the district from the health standpoint—have become the habitation of many of the company's work-people. Had the Lackawanna Steel Company done no more than secure title to all the ground between the lake shore and the railroads—a strip a mile wide and as long as desired—and reserved it for industrial purposes, the town must then have grown up a compact and organized community on the rolling land beyond the tracks, free of the muck, subways giving its people access to the lake-side plant.

Not only in its initial layout, but in its sanitary equipment, the community suffers from lack of concerted planning. As a city, Lackawanna is only about two years old. Before that it was not even a village. It was simply the township of West Seneca. The township form of government is a very good one. Several millions of people in the United States are living under it, scattered about on farms, just as they were in West Seneca ten years ago. But the West Seneca township government hardly filled the bill when 15,000 people decided to live on about four square miles within its borders. That created a sanitary problem beyond the ken of the town fathers. Some form of sewage disposal, however, became imperative, so a contract was let for the construction of sewers and a disposal plant. The work was finished some time ago, and it then developed that the town authorities and the contractor had tried too hard to be metropolitan. A court enjoined the city from accepting the sewer and several town officials went to jail. It is alleged that the contractor hated so to delay the work that whenever a rock was encountered he built the sewer up to the rock on one side and then began it again on the other, an expeditious and conservative plan. Consequently, the city has had to depend largely on privy vaults and cesspools. In the better section, east of the railroads,

Photograph by George J. Hare.

THE "OLD VILLAGE."

private enterprise has built sewers emptying into Smokes Creek, which winds about through that section and runs toward the lake just back of the "Old Village." In addition to the private homes thus provided for, there is an immense institution in the northeastern corner of Lackawanna, a home for children and infants, often housing a thousand or more at a time. The sewage from this institution also empties into Smokes Creek, which thus becomes an open sewer, running through the residence section east of the tracks.

The evils of this situation are much less than might naturally be expected, because the eastern section of the city, and especially that portion adjacent to Smokes Creek, is not closely built up. The menace to health that exists there will, of course, grow increasingly grave with the increase in population.

On the lake side of the tracks two widely different sets of conditions pre-

vail. The two villages owned by the steel company are each provided with sewers built by the company, which adequately meet the needs of the residents. Here we find the best sanitary conditions to be found in the city of Lackawanna. But between the two villages, in the foreign section, shocking conditions prevail. This is the region of boarding-houses, with the usual attendant carelessness and irresponsibility. One would think that modern sanitation had not yet been heard of. There are privy vaults, often unspeakably filthy, and even impossible of use. The difficulty involved will be apparent when you remember that this is a swamp region. Water in some cases completely surrounds the houses. In other instances, there is dry land on two or three sides at best. In practically every part of this district, even where the water is not close to the houses, it stands in the cellars.

Still, some of the big lodging-houses

there have bathrooms and inside toilets. I asked how the waste was disposed of, and the boarding-house boss took me out and showed me an open sewer emptying into the swamp, a few rods distant. I had noticed the open sewers before, but did not dream that they were intended for anything more than waste from the kitchen sink.

The swamp then becomes a great open cesspool in the heart of the foreign boarding-house section. Practically all the sewage of this section ultimately finds its way thither. But that is not all. The city provides for garbage removal, and the wagons are supposed to go around twice a week. Perhaps they do,

but few care to try to do what might be done toward making the section more habitable. The interiors of some of the houses—a minority—are remarkably clean. But outside there is everywhere filth. It is not only the back yards that are neglected. In every vacant lot and alleyway, no matter whose living-room windows open upon the scene, there was, when I was there, the accumulation of months—beer kegs, bottles, old shoes, tin cans, débris of all sorts.

TYPICAL LACKAWANNA SCENE.
Sidewalk, swamp, and boarding-house.

but I saw heaps of garbage in the rear of a great many houses, every time I passed along the streets. Sanitary cans were neither provided nor required. Consequently, the swamp seems to be a great temptation and garbage is often thrown from the back door into the water.

There is a sort of "what's-the-use" air about this foreign quarter. The chances of being clean and sanitary are so re-

Yet, the foreigners prefer this section to the clean and sanitary "Old Village." I remarked above on the vacant apartments there. I am told that even when the mills are running at full capacity the demand for apartments is small, while congestion is at the maximum in the swamp district. There is no doubt that people, whether native or foreign born, dislike monotonous box rows as dwellings. They also dislike anything that is all too plainly stamped "company house." Yet you might naturally suppose that in spite of these things there would be a constant battering at the doors of the company houses to escape the filth and ever imminent pestilence of the swamp district. But if you should

expect that you would be overlooking two things.

First, the residents of the saloon-boarding-houses are untutored peasants. They have never been taught anything about the importance of sanitation in congested centers, and, having come from farms or small farm villages in Europe, they have not had object lessons. Hence, they do not dread the open sewers and the swamp as their children—those who live to grow up—will do.

only play-house in Lackawanna—a moving-picture show—and found it packed with a “standing room only” crowd, mostly foreigners, who with a quiet absorption were watching a very excellent set of pictures. In the foreign saloons that night I found the men in congenial groups at the bar, around the stove—sometimes talking, sometimes singing—and other groups playing pool or cards. In a large room back of a saloon I found a dance in progress. There were only five or six women and girls to about fifty men, but those who could not dance looked on, while the musicians played for waltzes and folk dances.

These social pleasures were not amid the best surroundings. To

Second, there are no amusements of any sort in the “Old Village.” It is simply a hive of four- and five-room apartments. In the beginning there was not even a store in the village. Now a grocery displays its wares in the small rooms of one of the dwellings. A drug store is to be established. But still there is no opportunity for social pleasure. There is no place in the “Old Village” where any considerable number of people may gather together. There is neither church, nor saloon, lodge room, nor dance hall, and it is nearly a mile to that part of the town where these things may be found.

I realized what this could mean when, on a Saturday night, I stepped into the

be sure, everything was quiet and orderly, a feature to which contribution was undoubtedly made by the presence of the two policemen who were my very accommodating guides; but there was considerable liquor drinking in all of these social groups, and each time between dances in the “ball-room” the men took their partners to the bar, and young girls and women alike took their drinks. Yet, out of it all,

ANOTHER LACKAWANNA SCENE.
Street, Saloon, Boarding-House, and Swamp.

I got a new impression of the Slavs and Huns as social beings, and when I thought of those bleak company rows I was less inclined to wonder that there were a hundred vacant apartments there.

So far, I have been writing of the community without regard to its activities during working hours, which, no less than the physical environment, shape and mold the life of the townspeople. Lackawanna is an industrial town. Most of the male population work in the steel mills, two-thirds of them as day-laborers.

Common laborers are paid by the hour and the present rate is fifteen cents. That allows a daily wage of \$1.50 for a ten-hour man and \$1.80 for twelve hours. Frederic Almy, secretary of the Buffalo Charity Organization Society, after a careful study of the cost of living, in all sections of the city, reinforced by years of relief work among needy families, estimated in 1910 that the least *tolerable* income that would admit of the decencies of life for a man and wife and three children was \$560. This is just for the decencies and does not allow a cent for amusements, toys, postage stamps, extra hair-ribbons, or even medicine or doctor's bills. A steel works laborer can just about make it if he works twelve hours a day, 313 days in the year—a schedule which allows him his Sundays off. If he wants to take the children to a moving-picture show, or have an occasional visit from the doctor, he can attain to those advantages only by working Sundays too. But, if he happens to have a ten-hour job he cannot reach this "tolerable" income even by working every day in the year. His year's earnings would be \$547.50—twelve dollars and fifty cents below Mr. Almy's minimum. Bad transportation facilities and scarcity of land have no more to do with congestion and unsanitary homes than does this schedule of wages, which compels the 60 per cent of all employes, to whom it applies, either to remain single or to take boarders. It shows us the great economic lowland in the community life, as dominating in its way as the swamp which it fairly resembles.

How large a proportion do work twelve hours a day and seven days a week, and so achieve an income sufficient to support a family, I do not know. But I do know that in November, 1910, when I was there, a majority of the steel workers at Lackawanna, as at Pittsburgh and elsewhere, were working a twelve-hour day. The seven blast-furnaces were operated continuously, seven days a week, just as everywhere else; and, contrary to the custom of the United States Steel Corporation, the twelve open-hearth steel-making furnaces were also operated continuously. To man the blast and open-hearth furnaces required about 1400 men. But, in addition to these, about 100 electrical workers, and at a very minimum estimate 150 millwrights, repair men, furnace tenders, and watchmen were required in the plant on Sunday. Besides these, the gas-house men and three hundred hours a day and seven days a week. This made a total of about 2,000 men working in the seven-day departments, most of them working twelve hours a day and seven days a week. Crews were provided in the open-hearth department, where something over 300 men are employed, of sufficient size to give each man one day off each two weeks; but in the other departments a rest day came only on the request of the men.

"A man can't live a decent sort of life working that way," a seven-day workman in Lackawanna said to me. "Life is just a steady round of toil, and it tells on a man in time. It's simply a killing pace and I'm going to quit as soon as I get a stake."

But this was a ten-hour man—he worked only seventy hours a week. I talked with another man, Charlie Smith, who, the week before I saw him, had been required to work, with brief stops for lunches, from six o'clock Saturday morning until two in the afternoon on Sunday—a total of thirty-two hours. Then Monday morning he went to work at six as usual, but at six that evening the man who should have relieved him failed to appear; so he had to remain for the night shift also, making another period of twenty-four hours of continu-

Photograph by George J. Hare.

A HOUSE WITH WATER HANDY.

ous labor. Thus, during the seventy-two hours from Saturday morning to Tuesday morning, this man was actually on duty fifty-six hours, and had sixteen hours for rest—exactly one-third of the resting time that most men get during an equivalent period of time. I asked Smith how he could stand it.

“Well,” he answered, “I’m dead for a week after a long grind like that. It’s pretty hard to stand, all right. You would think they would at least pay us extra for over-time, but they don’t, so we don’t even have that to console us.”

“But it’s hard on the wife, too,” said Mrs. Smith—we were talking in Smith’s sitting-room—“I have to get up at half-past five every morning to get him his breakfast. On Mondays he goes to work earlier, so I get up at half-past four. And it’s late at night before I’m through with the work. But worst of all is the uncertainty of everything. I never know when he will have to work a long shift. If he comes home at half-past five, that

means I’ve got to rush supper so he can get back to the mill. We never dare plan to spend an evening out anywhere. We have made so many engagements only to have to break them.”

It is no wonder that steel men are looking for other openings—for a chance to get out of an industry that leaves them no time in life that is not dominated by toil. Jim Everitt, another Lackawanna man, summed up what many steel workers, all over the country, have told me when he said, “I don’t take any pleasure in my work, nor the other men don’t either. If we had eight hours it would be a great job, with lots of excitement, one that I’d want to get back to. But the way it is now, twelve hours a day and sometimes seven days a week, I don’t get any pleasure out of the job or out of life.”

It is the effect of this working schedule upon everyday life that is most important. The twelve-hour day and seven-day week are as effectual bar-

OPEN SEWER IN INGRAHAM PLACE, LACKAWANNA.

riers against healthy social growth and good citizenship as the railroad tracks and the swamp are a check on the healthy growth of the community.

Just one more illustration will make the point clear: I did not try to take a religious census, but there are at least four Protestant churches in Lackawanna, the largest being a Presbyterian church. None of them appeared to be very strong, or to attract a large number of people to the regular services. There is at least one Catholic church where the membership is predominately American, and several foreign Catholic churches.

It seemed to me that there was something significant in the fact that the Congregational church in southeastern Lackawanna was not holding Sunday morning services; that the pastor of the Methodist church did not reside in Lackawanna, but made his living in business in Buffalo, coming out on Sundays to preach; that the pastor of the Presbyterian church was adding to the area

within which his voice might be heard by editing a weekly newspaper;¹ and that even the Catholic churches could not depend on their members observing the rites of the church. I asked the pastors of two of the Protestant churches and the priest of the American Catholic church about it. They all said the same thing—that the long hours and Sunday work of the steel mills are fatal to spiritual growth. The Congregational church suspended its morning services because its male members are either at work or in bed, after a night of work, at the time for beginning Sunday morning services.²

¹This minister has now left Lackawanna. The paper is in other hands and the church, for the present, is without a pastor.

²In the spring of 1911 important changes took place. The blast furnace crews were organized on such a basis as to give each man one day of rest in seven. An attempt was made to do the same in the coke ovens, but the men objected on account of dissatisfaction with the day of rest allotted, so the plan was abandoned. The men do take off about three days in each month. In addition to these changes, which give a weekly rest day to 1300 or 1400 men, the working day for the common labor force has been reduced from twelve to ten hours.

A TYPICAL SCENE IN LACKAWANNA.
Boarding-House, Swamp, and Steel Mill.

"It is a calamity to a community," said one of the churchmen, "to have a steel plant built in its midst, for steel is made in America today under conditions ruinous to health and morals."

But there is a better side, a more hopeful side to Lackawanna, which must not be overlooked or forgotten. The town was not built right; but there are many existing evils which can be overcome despite its false start; and there are many evidences that both the people and the steel company want to overcome them.

Some of the undesirable conditions that prevail are due to the natural crudeness of a young and rapidly built city. It has been only about two years that the people have had an adequate governmental machine for carrying on the work of the community. There has been much improvement since the incorporation of Lackawanna as a city, and plans for larger improvements are now on foot.

Still, if one were inclined to be captious, he might inquire why the Health

Board has not tackled more vigorously such comparatively simple matters as the keeping of alleys and yards in a clean, sanitary condition, and the proper removal of garbage. This summer, after a seven months' absence from Lackawanna, I was able to recognize an accumulation of refuse between two houses as the same that I had noted on my previous visit.

But health board and council are both waking up, and it has been determined to end the congestion in the lodging-house section. The council has passed a tenement-house ordinance, regulating air space. The present is a peculiarly strategic time for getting such a movement started. Since the lodging-houses are now half empty, it should be much easier to prevent a recurrence of overcrowding than to empty over-full houses. The city is building cement sidewalks and is paving Ridge Road with brick.

In May, 1911, the State Board of Health advised the local authorities to

start the pumping plant, which had been tied up in the court proceedings, and get the sewer in operation. This was done, but since the sewer had never been formally accepted by the city, it is not connected with the houses. The only effect of starting the pump has been to lower the water in the swamp, which seeps through the broken joints of the imperfectly constructed sewer. This may not prove to be a sanitary move after all, for small open sewers still empty into the swamp, and the sewage must now collect in little pools here and there, instead of being diffused through a large body of water. Yet this action may prove a step preliminary to completing and getting into operation an adequate system of sewers.

To turn to the social enterprise being manifested by the steel company: during the past year it has nearly completed the work of filling with slag the swamp land adjacent to the "New Village." Recently the Rogers-Brown Iron Company, operating blast furnaces in South Buffalo, near Lackawanna, offered slag free to the city for filling the swamp in the boarding-house district, and the South Buffalo Railway Company, a subsidiary of the Lackawanna Steel Company, offered to haul the slag free of charge and dump it at convenient points. In June this work had not yet been started, and it was said that some of the non-resident owners of swamp property object to having to pay for the mere distribution of the filling, after it has been brought to their very doors. It would seem that there could be little doubt of the power of the city to compel the land-owners to take advantage of the offer.

In addition to these forward movements, the steel company has recently interested itself in social work. In the summer of 1910, it secured the services of James Bronson Reynolds in a thorough investigation of social conditions in Lackawanna. Both along civic and industrial lines, Mr. Reynolds brought unique equipment to this commission. He was for a number of years head worker of the University Settlement, New York, and during the Low administration was secretary to the mayor, in

which position he was able to give a more complete social content to municipal activities in New York than had hitherto characterized them, and to bring the City Hall into intimate touch with the many foreign-born people on the East Side. Later he represented President Roosevelt on a number of important special commissions—among them an inquiry into housing conditions in the national capital which resulted in the creation of the president's Homes Commission, and, with Labor Commissioner Neill, the special investigation of the Chicago stock-yards following the exposures of *The Jungle*. James Speyer, a member of the board of directors, is also the leading trustee of the University Settlement. In recasting the social policy of the company it was natural that the directors should turn to Mr. Speyer's old associate. A number of interesting and hopeful things have resulted directly and indirectly from Mr. Reynolds's report, the first of its kind submitted to the officials of a large employing steel corporation by a man of independent standing as an economist and social worker.

One of the first things was the organization of a Sociological Department. So far it has not been determined just what lines of activity are to be taken up by this department, but a way is being blazed out for it in an interesting manner. About a year ago a settlement, in which several Buffalo people were interested, was started in Lackawanna by Miss Emma Kaan, an artist of Hungarian descent. A committee has been organized of which George P. Sawyer, of Buffalo, is chairman, and with which General Manager C. H. McCullough, of the steel plant, is co-operating. This committee has assumed charge of the settlement and of social work in general in the community. One year ago there was practically no social work in Lackawanna. Now, in addition to the settlement itself, there is a model lodging-house conducted by the settlement; two visiting nurses are at work; a Y. M. C. A. worker, who last winter conducted evening classes for men, spent the summer in charge of a boys' camp in the country near Lackawanna; a trained Charity Organization Society worker

TAPPING BLAST FURNACE, LACKAWANNA.

has been in the field since March; a playground has been opened and a director secured; a modified milk station and a dispensary have been established. Of the expense attendant upon these enterprises five-sixths is borne by the steel company.

During the past month Elizabeth S. Williams, long head-worker of the College Settlement on Rivington street, New York, has taken up residence in Lackawanna. Miss Williams takes temporary charge of the settlement to develop its activities; and during her stay she will study the needs of the community and help organize further efforts at improvement. The Sociological Department of the steel company will undoubtedly keep closely in touch with this outside work and thus rather remarkable co-operative relationships for improvement in mill and town will be instituted. The application of the experienced judgment and democratic standards of neighborhood

workers, who have had their training in the tenement life of the great cities, to such an outlying self-contained industrial community as Lackawanna is in itself an experiment which will be watched with interest.

There is need, however, for many things in Lackawanna which can be solved only through the municipality; and it is towards such public action that these voluntary agencies will no doubt in no small measure address themselves, in co-operation with those residents of the town who in the past have stood out for better things.

The filling of the swamp should be insisted upon. The building of an adequate sewer system should be rushed. The Health Board has at last been allowed one inspector—that is good, but more are needed. The city should be cleaned up. The schools should be made to serve the people better in the way of vocational and night schools. The build-

Courtesy Lackawanna Steel Company.
WARD IN THE MOSES TAYLOR HOSPITAL,
LACKAWANNA.

ings should be opened as social centers. For these and many other advances the city is the logical source of authority.

These proposals are indeed part of the program that the North American Civic League for Immigrants is proposing to the city authorities of Buffalo proper. Their program puts chief emphasis on the extension of educational facilities in the form of evening schools, systematic instruction in citizenship, the use of school buildings as social gathering places, and such measures of industrial betterment as industrial education and adequate agencies for obtaining employment. Inasmuch as over two-thirds of Lackawanna's population is foreign-born, it is especially desirable that the league should extend its activities, as it has already tentatively done, to this industrial suburb.

But there is more to be considered than the reforming of Lackawanna. After all, it grew up in just about the same way that most towns do. That is no reason, though, why we should not learn from the experiences of Lackawanna how not to build a town. For the last new town has not yet been built, and we may as well consider how a better job may be done in the planning of industrial communities.

Everybody knew there was going to be a town at Lackawanna, just as soon as it became known that a steel company had planned to build a big plant there. The steel company knew it and acknowl-

edged its responsibility by building its two villages. It would have better discharged that responsibility, so far as the town was concerned, if it had been instrumental in making the beginnings of a well-planned, well laid-out city.

When a corporation goes into new territory to build a plant, it is by that act inviting men and women to come and live in the community. When it does that it owes it to its employes, and to society even more, to see to it that the community is a decent place for men and women to live in. You cannot erect a tenement in a city without submitting specifications to a public official and securing a permit. And if you do not intend to use certain materials, or take certain precautions, you cannot have the permit. Neither will it avail you anything that you are a well intentioned person, and that you cannot afford the prescribed material, or the kind of plumbing demanded. If you cannot afford it, you do not build. I think that sometime we will demand of a corporation that, before it commences building a plant in a district unsupplied with dwellings, it shall show to a state official plans for the development of a town where people may live amid healthy, decent surroundings. And if the company cannot afford, after paying the experts who have built its plant, to invest something in starting the town as a town should be started, with due regard to public health and morals, it should not be permitted to open its plant. This will give the community which the plant is to call into being the same protection that we now afford to the dwellers of a single tenement.

Regulation of that sort would have avoided many of the difficulties which now burden Lackawanna people. But it leaves untouched the larger problem—the work-relationships of the wage-earners. From every point of view this is the most serious problem. It is so to society at large, because of its extensive ramifications. It is so to the management, because of the serious conflict of interests where stockholders clamor for dividends, while higher wages and shorter hours may conceivably cut down those

dividends. And most of all it is so to the wage-earner, because, given fair work conditions, reasonable hours, and a wage that commands the comforts as well as the decencies of life, he can, in the long run, in a democracy, settle the other problems himself.

There are no easy solutions of the labor problem. It is not a local matter. You can regulate tenements in Lackawanna, but labor conditions are affected by competition and tend to uniformity throughout the country. It is not in Lackawanna alone that the twelve-hour day saps the vital energy of strong men and makes them useless as members of the social body. It is not here alone that men have forgotten the calendar because one day was no different from another, through the seven work-days of each week—a system now largely eliminated. Nor is it here alone that the wages paid are inadequate to maintain a normal standard of living.

But the Lackawanna Steel Company has carried the twelve-hour day further than has the United States Steel Corporation. It has exceeded the latter in the amount of Sunday work demanded; it not only requires continuous seven-day operation in blast furnaces where continuous operation is a technical necessity, but also in open-hearth furnaces, where it is not a technical necessity, and it pays

common labor a cent and a half per hour less than is paid in the Steel Corporation mills in Pittsburgh, a hundred miles away. The Lackawanna Steel Company has not, as yet, for various reasons, proved a financial success. Following a complete reorganization of the operating management of the company a few years ago a tremendous work of rehabilitation began. This should be borne in mind in reviewing the existing situation, especially in appreciating the difficulties which a management not yet in position to declare dividends may have in securing appropriations for purposes not directly productive of profits but which would improve living and working conditions.

But we are well within the bounds of reasonableness in asking the Lackawanna Steel Company—and the Pennsylvania and Bethlehem Steel Companies, too, whose employes are worse off than those at Lackawanna—that they shall bring their standard of labor conditions up to that of the best of their competitors, low as that is; and then we have a right to demand of the steel industry in America that labor conditions be raised to a point where there may be sufficient leisure and sufficient comfort in the homes of the workmen to develop healthy ideals of citizenship, and strength to meet local problems with democratic intelligence.

ORE UNLOADING MACHINERY AT LACKAWANNA.

WORK-ACCIDENTS AND THE FARM HAND

DON D. LESCOHIER

MINNESOTA BUREAU OF LABOR

The substitution of power machinery for hand labor has made agriculture a hazardous industry. Corn shredders, grain separators, gasoline engines, threshers, cream separators, and other forms of machinery have changed the character of agricultural processes, until much of the labor in the industry has become more analogous both in method and in danger to factory work than to earlier agriculture. Not only this, but much of the machinery used is far more dangerous than that used in most factories, for sufficient attention has not yet been paid to guarding it. The public has not known enough about the number and the causes of accidents on farms to realize that farmers need legal protection against unguarded machines as badly as do factory workers. Prevention is further retarded by the fact that the accidents are distributed over so wide an area that the persons injured do not combine and crystallize a sentiment for pro-

tection. When five men in a factory are killed in a year the operatives begin to ask why these accidents are happening and how they can be prevented; but when as many occur among the same number of farmers they do not realize that they have need to co-operate for protection.

Sixteen fatal accidents, two likely to result in death, eighty-five serious injuries, and thirty-two severe ones—a total of 135 accidents—were reported from Minnesota's agriculture during the past twenty months, eighty-two of them, including four fatalities, in the last eight months. The reports for the first twelve months were especially incomplete, but there is no reason to believe that the records even for the last eight months are a complete toll of the accidents. The figures given must be considered as illustrations rather than statistics.

Forty-one per cent of the accidents occurred on corn shredders, which are the most dangerous agricultural machines in use in the Northwest. One hardly realizes how common accidents on them are until one picks up the "country" pa-

pers during November and December and reads the comments of the editors.

One more was added to the long, long list of victims of the deadly corn shredder, when Curtis Kreger had his hand caught in the husking rolls of his father's shredder, Tuesday afternoon. He lost three fingers.

The crop of corn-shredder victims is not as large this fall as in former years, but every now and then fingers and hands are caught. Last Friday Frank Peterson cut the tips off the fingers of his right hand.

While Roscoe Mead is the only corn-shredder victim so far from Marshall this season, the shredder is numbering its victims by the

thirteen, of one finger. The death was due to blood-poisoning.

Fifty-two of the accidents happened on the "snapping" and "husking" rolls; one in some gears while oiling, and two on belts. The accidents on the rolls are typical accidents on the machines, and to make clear the manner of their occurrence and the means of their prevention we have presented the accompanying illustrations. The shredder reproduced is the "Deering" six-roll shredder.¹ The workman is standing ready to feed the

THE MOST DANGEROUS MACHINE IN NORTHWESTERN AGRICULTURE.

Corn-stalks are fed from table on operator's left to snapping-rolls concealed by hood in front of him. White circle indicates gears that operate snapping-rolls.

score throughout the state. The same machine upon which Roscoe lost all the fingers of one hand has twice before removed the hands of operators, one being the owner.

Fred Yes lost all the fingers of one hand and Charlie Saufferer's hand was badly lacerated last week. Both were victims of the terrible corn shredder, which takes its toll of the farmers every year.

Of the fifty-six accidents on these machines one was fatal; four resulted in the loss of an arm; nine in the loss of hands; nine, of four fingers; four, of three fingers; four, of two fingers; and

cornstalks into the machine. The bundles will be pitched down upon the platform at his side, on which a feed belt runs, and will be directed by him into the open hood which he is facing. At the back of the hood, at the point where the gear wheel at the left side of the machine has a white mark around it, are the "snapping-rolls." These consist of two corrugated rolls, which draw the corn-

¹The illustrations are reproduced from advertising circulars of the International Harvester Company.

SECTION OF SHREDDER HEAD AND SNAPPING ROLLS.

Corn-stalks are caught from table by snapping-rolls, which pinch off ears and drop them to husking-rolls at operator's feet, and then pass to shredder-knives shown behind and to right of snappers.

stalks in and feed them into the shredder knives, and at the same time snap off the ears and cause them to fall down into the "husking-rolls" underneath.

The second cut shows a section of the snapping-rolls, with the shredder knives behind them, and gives the reader some conception of how terrible it is for a man to get his hand caught in the snapping-rolls and drawn through to the shredder knives.

In the small, two-roll shredder the snapping-rolls are set in an oblique position, and the lower portion of them does the husking. They are probably more dangerous even than the large machines, because the stalks must be fed into a short oblique funnel instead of along a horizontal table, and the rolls are closer to the operator. Usually the accidents occur either because the stalks clog up the snapping-rolls and the operators reach under the hoods to try to make them run better, or because one or more ears clog up the husking-rolls, and workmen reach in and try to pull the ears out from there. A few illustrative accidents may be described in the words of the newspapers which reported them:

The machine was not running nicely, it having got clogged up with cornstalks, and Pete reached in with one hand to pull out the rubbish which caused the trouble. In some way his hand was caught, and two fingers clipped off.

He tried to loosen a corn cob which was stuck in the husking-rolls, and his glove was caught, drawing his right hand between the rolls in a second.

He had on two pairs of canvas gloves to keep his hands warm. One of the outer gloves was slightly torn, and this caught his hand and drew it into the shredder, breaking all the bones and lacerating the flesh in a terrible manner. His arm had to be amputated between the elbow and wrist.

The job was nearly completed when, about six o'clock in the evening, the machine became clogged. In the hurry, Mr. Lindstrom used his hands to clean out the husks. His right hand was caught between the husks and roller, and mangled so badly that the doctor found it necessary to amputate the fingers.

He was running a corn shredder and got his hand too near the blades of the machine and it was drawn in and badly mangled. Nearly his entire hand had to be amputated.

The 1911 Minnesota Legislature passed a law (copied from Wisconsin) designed to prevent these accidents. Its purpose is, first, to require such an elongation of the hood over the snapping-rolls that a man cannot reach in and touch either the snapping- or husking-rolls, and, second, to prohibit the operation of unguarded machines by incompetent persons. Vigorous efforts are being made by the labor commissioner to make the law effective and these regulations will unquestionably stop most of the accidents, though it will be difficult to prevent the employment of any but competent men on the old machines. The ability to reach the rolls and the youth and inexperience of many of the operators are the prime causes of the casualties.

Chapter 354, Minnesota Session Laws of 1911, reads:

Be it enacted by the Legislature of the State of Minnesota:

Section 1. No person, firm, or corporation shall sell, offer, or expose for sale any machine to be operated by steam or other power, for the purpose of husking or shredding corn or cornstalks, unless the said machine shall be provided with reasonable safety devices approved by the commissioner of labor for the protection from accidents from the snapping-rollers and husking-rollers, and shall be so guarded that the person feeding said machine shall be compelled to stand at reasonably safe distance from the snapping-rollers.

Section 2. No person, firm, or corporation shall use, operate, or permit to be used or operated any such machine purchased prior

to the passage and publication of this act, unless, during all the time such machine shall be used and operated, it shall be in charge of a competent person, whose sole duty shall be to oversee and attend to the operating and use of the same.

Section 3. Any such person, firm, or corporation, who shall violate any of the provisions of this act, shall be punished by a fine of not less than twenty-five dollars (\$25) or more than one hundred dollars (\$100.00) for each offense.

Corn shellers cause accident similar to those on corn shredders, but not so many of them. Five cases have been reported since August 1, 1910, in which the operators got their hands caught in the feed-rolls and drawn into the machines. Two each lost two fingers, another suffered a broken arm, and the fourth had his arm so crushed and torn that it was feared that it would be necessary to amputate it. These accidents, like those with the corn shedder, can be prevented only by so constructing the machines that the operators cannot reach the feed-rolls.

The wood saw is another dangerous machine on Minnesota farms, and, in the last five months, six serious accidents have been reported from its use. Most of them could have been avoided by a guard on the saw, though one was due to carelessness in nailing a board supposed to stop a belt from jumping. The board loosened, and fell on the saw, and it was thrown against the operator's head. At least one of the accidents was

due to a loose sleeve that caught on the wood-carrier and drew the operator's arm against the saw.

Belts and gear wheels probably rank next to corn shredders as causes of unnecessary accidents. The belt accidents are due either to attempts to put on or to take off belts with the machinery running, or to unguarded belts. A farmer who started a gasoline engine was caught by the belt and carried to his death in the shafting, and another, working near an engine, was caught by the trousers in the belt of the engine and whirled about the shafting, and his legs were broken. We can see no reason why light, transportable guard-fences cannot be used to guard the belts of machines moved from farm to farm, and a permanent guard be used to protect belts on stationary engines, as similar belts are protected in factories. Two serious accidents, caused by attempts to put belts on machines in motion, occurred in December. A farmer putting on a corn-shredder belt was caught by another belt and whirled three times around the shaft. He lost his arm above the elbow. Another was caught while attempting to push off a corn-shredder belt, and his arm was broken in two places. These accidents could be prevented by slowing down the engines while adjusting or removing belts.

Two deaths, two amputated arms, a crushed hand, and an amputated finger—the injuries in six gearing accidents re-

A UNIQUE "SAFETY DEVICE."

The tread-mill is used to keep his Royal Majesty, the bull, in sweet temper. He is doing service to his master and at the same time working off his surplus spirit.

THE NEW AGRICULTURE OF THE NORTHWEST.

An illustration of the rapidly developing use of traction engines in the plowing, harrowing, and rolling of farm lands in the Middle West and Western States.

ported during the past few months—show that these accidents are to be seriously considered. Two of them—the lesser ones—occurred while oiling corn shredders, the oilers having got their hands into uncovered gears. One of those killed was caught and crushed in the cogs of a separator, and the other was caught by a gear clutch on a gasoline engine, and hurled violently to the ground. The “loss-of-an-arm” accidents were simple cases of being caught in exposed cogs on gasoline engines. These accidents could all have been prevented, except possibly one of the oiling accidents, by covers over the cog-wheels. An inspection of the agricultural machinery on exhibition at last year’s state fair revealed that it is the common thing to leave dangerous gear wheels on agricultural machinery entirely uncovered. When one inquires why this is done, the manufacturers allege that the farmers want the machines at the lowest possible price, and they must economize wherever possible in manufacturing them. In Europe, where the laws compel the manufacturers to guard properly dangerous parts of agricultural machines, we are

informed that the same machines are sold by American manufacturers with proper guards.

Occasional accidents occur on a number of other machines—such as hay presses, cream separators, corn binders, hay and litter carriers, mowers, and grain separators—but in most cases the accidents are due either to a special carelessness on the part of the person injured, or to one of the causes we have already noted—especially gear wheels or belts. We will therefore not delay upon these accidents, but call attention before closing to some of the peculiar ways in which casualties occur in agriculture.

Three persons were drowned during 1910 by falling into wells, two of them well-cleaners, the other an old man who had been weakened by sickness and who lost his balance while drawing water. A well-digger was killed by an explosion of dynamite. Four farmers were badly injured by dynamite while blasting stumps. They clearly lacked knowledge of how to handle the explosive.

A farm laborer was killed by a vicious bull, and another seriously injured.

Three were badly hurt by horses. A farmer descending a wheat stack lost his balance and fell on a pitch-fork, sustaining injuries from which he died. Two threshers were going up a hill on a threshing-engine. The machine "reared up" as a horse rises on its hind legs. They jumped and ran. The machine came back to the ground and, uncontrolled, followed one of the men to the fence, crushing him to death. Two

others were crushed, but not seriously, between an engine and a separator, because of the breaking of a coupling-pin. A farm laborer fell in front of a gang plow. He was caught by the plowshare, and his leg was terribly lacerated. A farmer trimming one of his trees fell to the ground and was killed. Another was thrown from a wagon that tipped over while turning. His shoulder and several ribs were fractured.

SLAV FARMERS ON THE "ABANDONED FARM" AREA OF CONNECTICUT

ALEXANDER E. CANCE

EXPERT IN CHARGE OF THE REPORT OF THE IMMIGRATION COMMISSION ON
RECENT IMMIGRANTS IN AGRICULTURE

Recent agricultural immigrants to southern New England, though not numerous, represent three rather distinct economic types. First are the laborers, Portuguese, Finnish, Italian, and Polish, chiefly employed in gangs on the cranberry bogs of Cape Cod or on market gardens near Providence and Boston. Here, capitalistic, highly specialized, large-scale agriculture demands large numbers of low-priced laborers on the one hand, and highly efficient foremen or managers on the other—dear land and cheap labor. These immigrants are agricultural laborers pure and simple and are separated from land ownership or land proprietorship by an almost impassable gulf.

The second class are the rural communities of land-owning foreigners who occupy fertile soils, such as those in the Connecticut valley, and who are engaged in the production of special crops—onions, tobacco, fruit, or market garden produce. These colonies for the most are prospering wonderfully and have become permanent additions to the rural communities of their adoption. Their present problems are connected with

what may be called their higher life—social, educational, moral, and political. Materially they are on a prosperous and hopeful footing.

The Slavic and Jewish immigrants on the Connecticut highlands, with whom this article deals, must be regarded in an economic light as different from those just mentioned. There are few sections of Connecticut rougher, stonier, or less adapted to general farming than the upland towns lying between the eastern wall of the Connecticut valley and the Willimantic river, from New London and Saybrook northward to the Massachusetts line.

For many years this section has been agriculturally decadent, and the rural population has declined steadily. Communities that flourished a hundred years ago would now be well-nigh depopulated were it not for the recent ingress of foreigners; thousands of acres of land formerly in tillage have been allowed to grow up to chestnut sprouts, and extensive areas of pasture land are now producing little but brush and briars.

The restoration of these lands is a grave problem. Conservationists have recommended white pine, agricultural experts have advised the introduction of sheep husbandry, while with the same purpose in view—that of re-populating the worn-out ridges and restoring their

¹The material facts used in this paper, which is the second in a series by Alexander E. Cance on agricultural immigrant groups in the United States, were gathered by the author while investigating immigrant communities in New England for the United States Immigration Commission. The first article in the series, Piedmontese on the Mississippi, appeared in THE SURVEY of September 2. Price 25 cents.

"BOHEMIAN HALL," WILLINGTON, CT.
The Bohemian flag is flying beside the American.

fertility—philanthropists, humanitarians, and real estate agents have urged immigrant occupation. The execution of this program of vicarious restoration has, strange to tell, proved more beneficial to the land agent than to the incoming immigrant. The immigrant pioneer settling the western prairies goes to his uncleared, virgin land as to a bank, upon which he may draw indefinitely for sustenance. The roughly scratched soil, sown to grain, without further effort gives abundant returns. On the thin, worn, long exhausted acres of upland New England, however, this procedure produces nothing. To draw from the bank, the immigrant must first make rather large deposits of labor and fertilizer. The soil must be constantly and consistently coaxed and stimulated. Consequently the foreign occupant, who frequently comes from a New York factory where he has been earning \$15 to \$25 a week, and who has invested nearly all his spare cash in land, with little capital and small knowledge of farming, is likely to meet discouragement or disaster in his first en-

counter with the exhausted farm, which the owner probably sold because he could not earn a living upon it.

One typical case may be mentioned. On the top of one of the roughest ridges in Tolland county a Slavic family, in 1905, bought an old farm of sixty acres. About half of the land had once been in tillage and \$1200 did not seem an exorbitant price to pay for land and buildings. The family consists of a man and wife, about fifty-nine years of age, two daughters employed in New York, and two sons about twenty-two and nineteen years of age, respectively. Despite the fact that the younger son works very steadily in a neighboring pearl button factory, the family have not been able to support themselves and have been obliged to call on the daughters for aid more than once. They are neat, careful, hard-working farmers, but the rock-strewn, infertile fields give meagre returns. A careful accounting showed that scarcely \$20 worth of produce had been sold from the farm in 1909.

Adequate capital and expert knowledge

PEARL BUTTON FACTORY, DALESVILLE, CT.
Many farm boys work here for supplemental income.

of fruit-raising would probably make the farm profitable after a few years. But the father invested all his savings in the land and a few head of stock. He is not an expert farmer and his hardest labor and most careful attention to details do not suffice to win a meagre subsistence from the sterile hillsides. This instance is rather a type than an exception in the particular neighborhood.

But the obstacles are not all of the same nature. Even with infertile soil the foreigner accustomed to the rent-ridden fields of Europe might be able to coax a lean return from the so-called "abandoned" hills of New England, were he able to purchase his land at a fair valuation. But this is reckoning without the "land shark." The movement of Slavs to Tolland county dates back but a few years—to 1902 or 1903. The greater number have arrived since 1905. The first comers, who dealt with original owners, fared very well, buying land at its real value—about \$4 to \$8 per acre. Later the available tracts were grabbed up by real-estate speculators, who gath-

ered in the bargains, sold the timber to lumbermen for the purchase price of the land, and, stocking the farm with a few old cows and some second-hand tools, disposed of the denuded acres to the credulous and unsophisticated newcomer for more than the original sale price. Some of the agents are Americans, some are foreigners who advertise extensively in Bohemian and Polish newspapers.

The testimony in regard to sharp practices is specific and ample.

"It is a shame," said an intelligent officer, "that such barefaced rascality should go on. I have known farms that were bought for \$1,000 to be sold by the buying speculator within a month for \$5,000, *timber rights reserved*. The price asked is ordinarily limited only by the size of the land-seeker's pocketbook."

One man who paid \$1,000 cash for a place found that the agent had bought the option on it from the American owner a few days previously for \$400. Another, who bought seventy-five acres in 1908 for \$1850, found on survey that the farm had shrunk to fifty acres and the

POSING FOR THE CAMERA.

assessed value to \$400. In Tolland county more than one-half the foreigners interviewed by the author for the Immigration Commission related tales of exploitation of one sort or another. The reservation-of-timber clause in deeds to immigrants is so common that it may be called universal. The buyer of fairly thrifty, growing chestnut timber land is thus not only deprived of his only immediate source of revenue, but is sometimes left without sufficient firewood in a region of forest. It is clear that some steps should be taken to investigate and prevent the continuance of methods that would scarcely have been tolerated in the palmy days of real estate piracy.

Exclusive of Jews, who have settled in comparatively large numbers near Chesterfield and Colchester, in New London county, perhaps 125 families of Poles, Bohemians, and other Slavic peoples have purchased farms on the upper Connecticut highland, chiefly in Tolland county. The Bohemians are perhaps the most numerous, the most prosperous, and on the whole the most discontented. Nearly all the foreigners migrated from New York city, but the Bohemians came from skilled occupations and brought more money with them than the Poles and Slovaks. The Slovaks are the most recent comers; they are poor, occupy rough, stony, barren land for the most part, and their hopeless attempts to clear and put in cultivation little patches of rock-strewn soil are pathetic.

It is significant that very few or none

of the thousands of immigrants employed in the textile mills that thickly line the banks of the Willimantic river have become farmers. The city-to-country movement of factory-workers in the immediate vicinity is almost negligible. Nor has there been any organized movement to this section nor any purposeful scheme of colonization. It is interesting to observe, however, that the motives actuating the rural trend of foreigners are not different from those that impel Americans to the countryside. Some confessed that they had gained their notion of the charms of country life when spending their summers with some Bohemian family in the country. A few families came purposing to take summer boarders and are discouraged to find that a forty-acre farm will not provide vegetables, fruit, eggs, and milk to feed forty boarders. The summer boarder industry, rightly managed, is a source of profit, but few have succeeded in the enterprise. Others came lured by the glowing advertisements of cheap land and easy living, inserted in Slav periodicals by land agents. Some came to escape the factory life of the great city and several came seeking health and a country home. Few have had much rural experience; most of them found land and rents ridiculously cheap compared with New York city prices, and practically all have felt severely the loss of the regular weekly cash income from factory labor.

The isolation has, in some respects, worn upon the women and the young, but the unresponsiveness of the soil to their constant and untiring exertions has been the greatest cause of discouragement. Some families live very meanly, and were it not for supplementary earnings in the small pearl button factories scattered here and there through the county they would surely suffer want. Several of the earliest settlers have given up in despair the hopeless attempt to win a living from their farms. The grown-up members of the families are almost invariably found employed in some supplementary factory occupation.

Two further considerations tend to retard the progress of the Slavic farmers;

the growing of staple crops exclusively, raised by primitive methods, and the inadequate facilities for marketing their products. The principal district under discussion is about fifteen miles square, with a branch of the Willimantic river running north and south through its center. Stafford Springs, having a population of 2460 in 1900, is the principal railroad town and marketing center; within its boundaries are fourteen woolen and shoddy mills, employing hundreds of immigrants. Despite this body of local consumers, the chief crops raised in Tolland county are hay and oats, corn, a few potatoes, and a little rye, buckwheat, and millet. Most farmers keep a few cows of nondescript breed, selling the milk, delivered at the railway station every morning, to Boston or Providence milk contractors. Most of the farms are six to ten miles distant from town, over rough, steep dirt roads, and few crops are produced for market. Excepting milk production, the agriculture is primitive, extensive, and self-sufficing. Of twenty-six farms investigated in some detail, only three-fourths showed any cash returns from products marketed. None of the Slovaks reported sales of more than \$250 yearly, and 41 per cent sold nothing for cash; one-third of the Bohemians sell less than \$50 worth of products per farm per year, one-half sell between \$50 and \$500 worth, and only three average more than \$500 worth of cash sales.

Oxen are frequently used instead of horses, scythes are more numerous than mowing-machines, self-binders and threshers are unknown. Annual applications of commercial fertilizer rarely exceed \$6 in value on Slovak farms, and in almost every respect agriculture is very backward. The native farmers are, on the whole, doing a little better than the newcomers, very few of whom are at all hopeful or contented. The Bohemians are hard and intelligent workers, and despite the dilapidated condition of the buildings when purchased most of them have greatly improved their surroundings and have neat and well kept farmsteads.

One of the greatest handicaps to agricultural progress is the distance to

THE BACK DOOR.

markets, or rather the actual dearth of markets for any produce that returns a profit. Milk is really produced at a loss, fresh vegetables for the local trade are not being produced in any systematic way, and shipments of perishables to the large cities are not remunerative. In fact, lack of markets is one of the most frequent complaints of the immigrant. Were it not for the income derived from mill employment and outside labor, existence would be impossible in some instances. Those fortunate enough to have unreserved timber tracts from which railroad ties can be cut are able to increase their receipts materially by removing the timber, but farm produce is not a dependable source of income.

Socially the foreigners are hindered by poverty and isolation. Nevertheless, several social enterprises have been set on foot by the Bohemians. In one place there is a local Bohemian band; in another a farmers' organization for crop and stock insurance and social purposes. An active local of a well known Bohemian mutual aid society has purchased a country school-house (over which float both the United States and the Bohemian flags) in which to hold regular meetings; a woman's auxiliary aids in developing the social life of the immigrants.

The foreigners have no common church affiliations—a fact of significance, permitting the rapid dissolution of national and racial ties and the ready Americanization of the Bohemians. The children attend the Protestant Sabbath

A SLAV FARM HOME IN CONNECTICUT.

schools with American young people, but few of the older people have any regular church connections. The Bohemians have high ideals of education. All their children of school age attend the district school with great regularity; some attend high school, and a few of the boys are at college. Lack of funds alone prevents a larger use of educational facilities. The Slovaks are poorer and have a lower economic and educational standard of living. A large percentage of the Bohemians are either American citizens or have taken out first papers; of the other Slavs scarcely any have taken any steps toward citizenship. All in all, immigration to this "aban-

doned farm" area has not been very successful from an economic point of view. On the other hand, the immigrants are for the most part a superior class. Numerous large colonies of Bohemians in the west are engaged in dairying and grain-farming on a large scale, and are exceptionally prosperous and progressive.

Or, by contrast, consider the remarkably successful occupation of the towns of Hadley and Sunderland in the Connecticut valley. In Sunderland the Poles will soon far outnumber the original native New England stock. They are steadily taking possession of the richest and most valuable riparian lands of the Connecticut, successfully raising tobacco and onions, buying homes for themselves, and settling down permanently. There is nothing exceptional about these Poles. They are industrious, and, working in tobacco and onion on fertile soil, their industry has been immediately and abundantly rewarded.

The fault lies not in the men but in the exhausted soil, the exorbitant prices paid for land, the isolated location, and the out-of-date system of agriculture. No people are more earnest or more willing to learn and practise more advanced methods; and herein lies a splendid opportunity for legal advice, agricultural demonstration, and practical extension work by the agricultural colleges, experiment stations, and state boards of agriculture, not only in Connecticut but in all of the older states where only expert, intensive, specialized farming is profitable.

WATCHING THE MISSIONARY'S HORSE, SIDON.

SYRIANS IN THE UNITED STATES¹

IV

THE SYRIAN AS AN AMERICAN CITIZEN

LOUISE SEYMOUR HOUGHTON

In the early days of Syrian immigration almost all came with the intention of soon returning to the old country. Business can be done in Syria with about half the capital required here, and these pioneer immigrants expected to return home after accumulating a small capital for this purpose. They did not seek naturalization. Later, they began to consider the advantage which American citizenship might give them when they returned home, including, as it does for Americans and as they imagined it would for themselves, extra-territoriality. The American government has always held that its naturalized citizens retain their citizenship wherever they go, even in the country of original allegiance. In this doctrine, however, it has stood practically alone. The large standing armies maintained by European countries make these governments loath to admit the claim, which they do only, if at all, by special treaty. Turkey has never agreed to such a treaty, and any naturalized

American citizen originally of that empire who returns to Turkey does so at his own risk. As a matter of fact, this, so far as Syrians are concerned, is in the main a purely academic question. No Syrian naturalized in America has committed any crime against the Turkish government, such as would compel the latter to act in case of his return to Syria; and therefore the fear so often expressed, as an argument against Syrian immigration, that naturalized Syrians will return home, commit crimes, claim extra-territoriality, and embroil our government with that of Turkey, is a mere chimera.

Since the constitutional revolution in Turkey, however, though not in the least because of it, the attitude of our government toward the naturalization of Asiatics has necessarily affected Syrians. The United States has, however, recently amended the immigration and naturalization law by which Asiatics were excluded from becoming naturalized citizens. The question whether Syrians could become naturalized was raised in St. Louis, where the United States District Court held that

¹No. IV completes the series of articles on Syrians in the United States by Louise Seymour Houghton. The three previous articles were: I, Sources and Settlement, July 1; II, Business Activities, Aug. 5; III, Intellectual and Social Status, Sept. 2. Price for each issue, 25 cents.

they could not become naturalized. This case was carried to the Circuit Court of Appeals in that district and the decision of the lower court was reversed. The same question was raised in the Southern District of New York, (New York city) about two years ago, and the lower court held that they could be naturalized; this decision was affirmed by the Circuit Court of Appeals of this district.

It might be expected that the recent constitutional revolution, which for the first time put the Christian subjects of the sultan on a par with Moslems as to liability to conscription, would operate to check Syrian emigration. Up to that time the Turkish government had perhaps not dared, had certainly not desired, to put a musket into Christian hands. Until then, for a Moslem to emigrate was virtually an act of desertion, since every Moslem might be called to the army at any time. But Christians labored under no such disability. At present all subjects of the Sultan stand theoretically on the same footing, and, it might be presumed, with a corresponding effect upon the emigration of Syrian Christians.

The best Syrian opinion appears to be, however, that liability to conscription is hardly likely to affect emigration, for the present government does not seem greatly to desire the presence of Christians in the army. Conversation with

a number of intelligent and leading Syrians after the Adana massacres brought to light the fact that the liability of Christian Syrians to conscription would be likely to check the return of Syrian immigrants for some years, at least. Not that they dread the ordinary hardships and chances of army life, but they do not believe that a government which dealt with the Adana criminals as the constitutional government of Turkey did can be trusted to be just to its Christian conscripts. This, however, was two years ago.

At present, the best Syrian opinion seems to be that emigration will not be appreciably affected for years to come—perhaps not for half a century, writes one of the most prominent Syrians in this country, since

the chief incentive of Syrian emigration is commercial, and Turkey cannot possibly afford the commercial advantages America does for many generations to come. It is true that life in Turkey is beginning to have a larger horizon and greater privileges, but it is equally true that according to the universal law of civilization the needs of the individual increase with the increase of his advantages, and life becomes more strenuous. Therefore, so long as the advantages of America are greater than the requirements of life in Syria, emigration from that country to this will continue to seem desirable to Syrians. To this must be added also the fact that social life in America, being more free, enlightened, and sanitary, holds out more charms for enlightened Syrians than life in their native land. In

short, it seems probable that constitutional government in Turkey will have no more restraining effect on Syrian emigration than such governments in Europe have had on European emigration.

Until the passage of the law excluding Asiatics from naturalization, the majority of Syrian immigrants sought naturalization, and fully one-half the male Syrians in the United States are naturalized, or have taken out their "first papers." They seek naturalization now because they propose to remain here, not because they expect to return home. It is true that from 20 to 30 per cent of those covered by this inquiry (1899-1907) declared their hope of returning home. These, however, were almost invariably recent arrivals. The exceptions were those who, having accumulated a small amount of money, insignificant here, but which would be a fortune in Syria, saw no way of increasing it except by slow economy, and preferred to go home to enjoy what they had. The prosperous have no intention of returning. Even those of the former class, so far as they have carried out their plans of going back to Syria, are more than likely to return within a few years. A Syrian from a city entirely outside the usual lines of travel returned to his native city after five or six years in this country in such a prosperous condition as to be the admiration and envy of all

his fellow-citizens. He built himself a fine house and took up as a pastime the study of the archeological remains in his immediate surroundings. This was seven years ago. Within four years he returned to America, finding it after all impossible to enjoy the *otium cum dignitate* of his life in Syria.

Some ten or twelve years ago, while the ideal was still to acquire a fortune and go home to enjoy it, many returned to Syria as soon as they had accumulated a little, bought land, laid the foundations of a large house, and came back to make enough to finish it and live in it. It would be safe to prophesy that not one in ten of these houses has been or will be finished for the original owner. Inquiry in more than twenty cities shows that not more than 1 per cent of those who are naturalized expect to go home, except for brief visits. The answer "Yes, and gladly!" given to the question as to the wish to remain appears to express the general opinion. Others answer, "All will remain." . . . "Some expect to go back but all will return."

Though in the case of other Turkish subjects, notably Armenians, permission has in a number of instances been denied, there seems to have been no difficulty whatever, either before or since the Revolution, as to the freedom of Syrians naturalized here to return to Syria for a longer or shorter visit. There is

FOURTH FORM BOYS OF GERARD INSTITUTE.

Field Day in Sidon, 1905. Several of these boys are now in the United States, two in South America. Two (college graduates) are teaching in Syria.

a constant though small stream of travel in both directions of Syrians who go home, sometimes alone to bring back a bride, to sell property, to settle an estate, or to buy goods, or, often accompanied by wife and American-born children, to visit parents and relatives. Such visits often last for several months or a year, but so far as Syrians are concerned no difficulty appears to have been found in gaining from the Turkish government the requisite permission for such a visit. It is certain that all Syrians in this country perfectly understand the laws and the practice of the Turkish government with regard to naturalized emigrants, and they are not likely to incur risks in the matter of visiting their native land.

Some Syrians express a wish that the brightest and most successful of their race should return home, since they could do much for their country. Love of Syria is rooted in every Syrian heart, however heartily they may propose to cast in their lot with that of their adopted country.¹ They are proud of Syria's natural beauty, of her undeveloped possibilities, her treasures hidden in the earth, her mineral wealth, her inexhaustible fertility. They believe Syria to be the richest country in the world, and they nourish a deep grievance against the late Sultan because his policy kept her

¹In this as in many other characteristics the Syrian, "the Frenchman of the East," is very like the Frenchman of Europe, whose loyalty to the adopted country—Holland, England, America, the Rhine Provinces—has for 300 years been proverbial.

in the rear of other nations. They long to change all this by the potent influence of Americanism, infused into her life by the return of her most intelligent and influential sons.

All Syrians in this country, quite as much, perhaps, since the Turkish revolution as before, desire a change in the government of the Ottoman Empire—the Christians through such a Protectorate as England has for a quarter-century exercised over Egypt, the Moslems by the substitution of some other Moslem power for that of the Turk.¹ But neither group desires to effect such changes by any other than the orderly method of working through public opinion to compel a reform in the existing government. Yet all this is rather a pious hope than an active endeavor.

There was therefore no foundation for the statement put forth a few years ago by several American writers that the Syrian love of freedom was taking the form of an organized effort to promote insurrection in Turkey. Such a statement places Syrian immigrants in a false light. A "United Syria" society does exist in this country, being perhaps the successor of the "Young Syria" society formed a number of years ago, not to promote insurrection, but purely to promote the welfare of Syrians. The Young Syria Society practically died some three years ago in the eastern states, especially in New York, where, as one of them said, (in 1908) "the Syrians are too busy to pay attention to Turkey."² Most of them, he added, are now American citizens, and would certainly not join in any step against the Turkish government. The Young Syria Society, however, still flourishes in the West, and appears to have gained new

¹In the early days of this inquiry it was interesting to discover that the less intelligent Syrian had devised a more immediate way. "Why does not President Roosevelt take Syria?" was the counter-question most frequently put at that time; and when it was pointed out that this would be beyond the scope of the president's powers, the instances of the Philippines and Porto Rico were always triumphantly adduced by way of precedent.

²A Syrian lawyer in one of our Eastern cities writes: "I have not recently heard of any activity on the part of the Young Syria Society with reference to conditions in Syria under the new régime, and I believe that interest in this movement in the eastern states is dormant. It may interest you, however, to learn that a new society is now being organized for the purpose of taking interest in the conditions of Lebanon. This society, is, however, yet in its inception."

hope and new activity since the constitutional revolution in Constantinople.

The United Syria Society above alluded to is of comparatively recent formation, and appears to stand on a much stronger basis than its predecessor. In the words of one of its officers, its purpose is "to improve the social and political status of Syria." The means by which it proposes to effect this end are by raising the general standard of enlightenment at home, and by arousing European public opinion. This (to quote

grant to this country was born and bred to manhood under a system of the most bitter religious hostility; that, as has before been shown,¹ the majority of local disturbances among them in this country have been due to the same cause, the fact that a society of Syrians can be founded upon a basis of broad catholicity (the word "tolerance" would do them injustice) speaks volumes for the influence of this country upon these men and for their capacity to become valuable members of the community. As

The parents were born in Syria, the children in the United States. The picture was taken in Cairo during a recent visit.

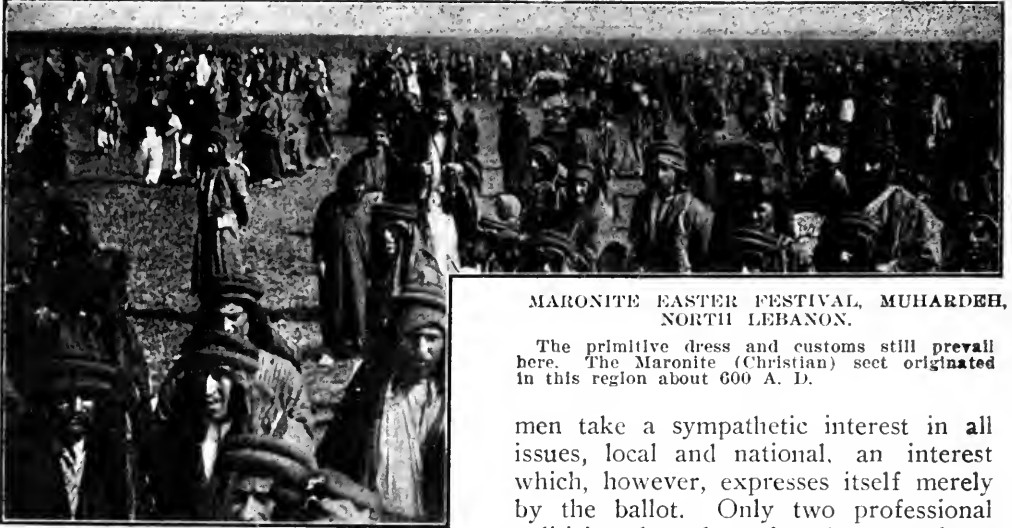

again) "is the largest Syrian organization in this country. There are no restrictions as to religions, and its aims are generally to promote the welfare of Syrians wherever it will find its efforts productive of results."

There is more significance than may at first appear in the statement that the United Syria Society permits no restrictions as to religions in its membership. When one reflects that nearly all the large uprisings and petty feuds in Syria have been due to religious antagonism; that every adult Syrian immi-

grant to this country was born and bred to manhood under a system of the most bitter religious hostility; that, as has before been shown,¹ the majority of local disturbances among them in this country have been due to the same cause, the fact that a society of Syrians can be founded upon a basis of broad catholicity (the word "tolerance" would do them injustice) speaks volumes for the influence of this country upon these men and for their capacity to become valuable members of the community. As

The primitive dress and customs still prevail here. The Maronite (Christian) sect originated in this region about 600 A. D.

are men of education and refinement, capable of holding their own among the better class of Americans. They always vote, and never sell their votes—although in one city they have been suspected of doing so—and they certainly have not been without the opportunity. A newly arrived immigrant, three years ago, naïvely wrote home to his family of the wondrous hospitality of this country, since he had not only been invited to vote, but paid for doing so; but such artless innocence is soon undeceived. Up to the present time Syrians have not particularly interested themselves in politics, save when a presidential election is impending. They have not aspired to office, except in one instance to be later noticed, but are at times sufficiently interested in local issues to combine their strength and throw their influence for a certain candidate. It is not surprising that as yet they are easily led by prominent Syrians and by leading American politicians; but, considering the proportion who cannot read English, and the largely personal character of the Arabic newspapers, they appear to be surprisingly well informed as to issues and candidates. They hold the franchise as a high privilege, and, although generally voting as Republicans, yet in local issues the character of the candidate appears to have more weight with them than considerations of party. The more educated

men take a sympathetic interest in all issues, local and national, an interest which, however, expresses itself merely by the ballot. Only two professional politicians have been found among them.

There is an independent political club in Chicago, with a charter and an executive committee of thirty members; but in most of the larger cities, especially in New York, religious differences work against political as well as social union. In one western city a prosperous merchant is frankly the political "boss" of a small colony. "The King" he is called, but more often by his American neighbors than by his Syrian adherents.

The one exception thus far to the statement that Syrians have not aspired to political office was found last year in Anton Simon, a prosperous commission merchant in New York, who lives in South Brooklyn. He was born in Lebanon, and has been a resident of this country for twenty years. Mr. Simon was chairman of the Roosevelt Reception Committee in 1910, and ran as the Republican nominee to represent the Fifth Senatorial District in the New York State Senate. Though defeated at the polls, his nomination was a significant and it may properly be said a hopeful event. In accepting the nomination Mr. Simon declared himself for state-wide direct nominations, for the income tax, the conservation of the natural resources of the state, and the hearty support of every effort to "drive out corruption in politics and to dissolve the union between corrupt politics and corrupt business."

With the exception of the one city where they seem to be of the least desirable class, and are certainly the least respected, the consensus of opinion is that Syrians make excellent citizens. Though they so far show the natural effects of centuries of oppression as not to be always morally robust, they are with few exceptions morally upright. They are frequently accused of being untruthful, and the accusation is no doubt well grounded; yet even this fault, in their case, is the reverse side of a virtue, or at least of a lovely quality—intense sympathy with the wishes of others, and an honest desire to promote them. It has been said, and hardly with

THE DOCTOR'S WIFE IN HER STUDY.

exaggeration, that if you meet a Syrian at the fork of a road, and ask which branch will lead you to your destination, you will almost see, behind his eyes, the travail of his brain to discover from something in yourself which road would please you best. This certainly does not harmonize with the so-called Anglo-Saxon love of truth, doubtfully manifested by many Anglo-Saxons; and one must admit that the Anglo-Saxon variety of truthfulness is not a Syrian characteristic. But his untruthfulness does not always spring from that generally prevalent motive, desire to promote his own advantage; and if truthfulness includes loyalty, ready self-denial to promote a cause

that seems to him right, the Syrian is to that extent truthful.

So with business probity. One of the Syrians themselves says that a care for honor keeps them honest, but indirectly they will steal, when occasion serves, by misrepresenting the quality of their wares. This, however, does not seem to be exclusively a Syrian vice. Not a single exception has been encountered to the testimony of Americans who have business dealings with them that they are perfectly honest and reliable. And if it be true that only a care for reputation keeps them honest, it is certainly striking that the large number of Syrian immigrants who are scattered through the country by twos and threes, totally ignored by the communities in which they live, have not suffered morally by isolation.

Though they are even romantically loyal to Syria, they have a keen sense of the advantages America has to offer them, and their gratitude to this country is deeper than the character of their reception here would seem to warrant. And the advantages are certainly not all on one side. That New York paper which more than any other has given notoriety to the crimes and misdemeanors of this people testifies that "there is not a more industrious or capable representative of the East than the

Syrians. He generally brings money, lives at peace . . ." summing up with, "They have an important part in the future of this country,"

Especially is this true of the women of this race. Even more striking than their readiness to sink age-long sectarian rivalry, and work together for benevolent purposes, is the fact of their readiness to enter upon a professional career—a striking fact when one considers the secluded lives of Syrian women in their own country. A delightful public speaker who is much in demand at religious and philanthropic conventions of American women is Madame Layyah Barakat. The wife of a prominent Syrian physician has a diploma in elocution and is a most acceptable lecturer. The fact that Syrian girls in this country are studying medicine has been mentioned. Strikingly enough, the example was set them by a woman of one of the best families of Syria who has not emigrated, but who, encouraged by American missionaries and English residents of her country, went to England and took a course in medicine, returning home to bless her own people. She is peculiarly successful in treating diseases of the eye.

An impressive illustration of the attitude of Syrian immigrants toward this country is furnished by recent economic conditions. The financial depression of 1907 and 1908 almost turned the cur-

rent of immigration back upon itself; but although Syrian immigrants, from the nature of their business, had acutely felt the effects of this depression, and although the large emigration from Syria in recent years had both raised the wages of labor and lowered the price of real estate in the home land, Syrian immigrants appear not to have had an important part in this reflex movement.

Small as our Syrian population relatively is, and destined as it is to become relatively smaller, since the limit of Syrian emigration must soon be reached, all that has thus far been discovered bears out the correctness of the newspaper forecast. Syrians have that to add to American civilization which a recent, and therefore crude, civilization, a civilization largely built upon rapidly and easily gained wealth, always needs: refinement, natural good breeding, calm dignity, courtesy, grace, punctilio, the spirit of a child, enjoyment of simple pleasures, frankness in the expression of opinion. All these our Syrian fellow-citizens are contributing, except where an instinctive sense of being underrated shuts them within themselves. Their facility and elegance of speech, common to all Arabs, but beautifully tempered in the Syrian by gentleness and courtesy of language, must tend to affect the lamentable prevalence of slang, as the high aspirations which actuated so many of them in coming here must tend to enoble the ambitions of those around them. The Syrians are a people of fine gifts, inherited from highly literary ancestors. Six hundred years ago their country was the centre of culture, and the customs of that period created social characteristics not to be neglected now. Their aesthetic taste, though in the nature of things, with a few distinguished exceptions, not greatly in evidence here, is destined, in the opinion of Americans conversant with the work of the few artists and writers whom Syria has sent here, to have an important influence upon our own art and letters. Even the beauty of face and elegance of form which characterize this race is not a matter of small importance.

In a still more important respect the Syrian may have a positive contribution

October 7, 1911.

ANTON SIMON.

Member of American Arbitration League.

to make to American civilization. That loss of religion with which this country appears to be threatened is largely due to a too narrow conception of what religion is. Upon this conception light must come from the East. Syria is the native home of religion, and her people are instinctively religious. They have the aptitude for religious expression, even when, as is too often the case through the age-long lack of educational facilities for their priesthood, their religion is entirely a matter of form, and rather a party cry than a matter of personal experience.

All the chief religious sects of Syria are represented in this country, Maronite, Orthodox Greek, Latin (Roman) and Greek Catholic, (Papal Greek) and Protestant. In recent years Moslems have begun to come; though for them as already mentioned emigration is practically desertion from the army, and therefore none of this religion can emigrate with any hope of returning to their own country.

Moslem Syrians in this country are

SITT HELENE NOFAL.
A Syrian physician of Syria.

still few in number, the majority of those commonly considered Moslems being a few of the unorthodox Moslem sect, the Metualey. So far as can be ascertained there are ten Syrian Roman Catholic churches, thirteen Maronite, seven Papal and seven Orthodox Greek, and eighteen Protestant bodies having Syrian priests or pastors. The Maronite church has a Syrian bishop, resident in Brooklyn, where he has in recent years built a very good church, which was dedicated with imposing ceremonies. There are also (at least) nine Moslem, three Druse, and one Metualey religious bodies, though it is not certain that all or indeed any have a religious head. Recently a few Syrian Jews have come over, but not in sufficient numbers to permit any useful study. There was only one in New York in 1902.

Besides these religious bodies there are many small groups, and scattered members of each sect are found all over the country. To a large degree Syrians have remained loyal to their own religion, especially where they are sufficient in number to maintain a minister. In Philadelphia, where there are two Maronite churches, a relic of the founder of the sect, Mar (Bishop) Maron, is exhibited annually on his feast, which falls on February 8. The largest Moslem community is perhaps in Providence, where they number 150, many of these, however, being Turks from Asia Minor. The most important Druse communities are in Pittsfield and North Adams, Mass.; the largest if not the only Metualey community in America is in Sioux City. In Buffalo, with the exception of one prominent Protestant family, the Syrian community is wholly Maronite. This sect predominates in Lawrence, Mass., Toledo, St. Louis, Minneapolis, and St. Paul; Latin (Roman) Catholics predominate in Chicago, Duluth, Cincinnati, Pittsburgh, Troy, Holyoke, and New Orleans. Orthodox Greeks are found in Pittsburgh and many other Pennsylvania towns; they have a priest in Johnstown. About half the Syrians in New Haven belong to this sect. Papal Greeks predominate in Albany, Worcester, Boston, and one or two Connecticut towns. In all large cities, however, a variety of sects are represented. In Toledo there are seven Syrian free-thinkers, some, at least, originally Maronites, a remarkable and in certain respects a hopeful example of independence of thought.

Protestants are scattered all through the country, and generally hold a relatively high position. Naturally, perhaps, they come here in numbers greatly disproportionate to the total Protestant pop-

SYRIAN FACTORY GIRLS, NEW YORK.

ulation of Syria, which is estimated at 125,000. They are numerous in Boston, Lawrence, and Fall River, Mass., Toledo, O., St. Louis, and New York. In Albany there are a number of Friends, business people of excellent standing. A Syrian graduate of McCormick Seminary was educated in the English Friends' School, Brumanna, and the Syrian Protestant College, Beirut, coming to this country later. He was barely graduated when he was chosen from among eight candidates to the pastorate of a large Presbyterian church in an Illinois city. Though he has been in America only a few years, his English is perfect, like that of all the Syrians who minister to American congregations. Another Syrian, a home missionary of the Presbyterian Church, has founded no less than three churches in pioneer towns in Nebraska, Montana, and Iowa. There is a considerable contingent of Syrian young men in the Christian Associations of Pawtucket and Woonsocket, R. I.; Lawrence and Springfield, Mass.; Burlington, Vt.; Willimantic and Norwich, Conn.; Canton, Cleveland, and

Youngstown, O.; Pittsburgh, Pa.; and also of New York.

Where they feel sure of a welcome and have no church of their own, Protestants are glad to attend American churches. A number of Protestants in Pittsburgh do so. A certain church in Boston has so large a Syrian contingent as to cause some discomfort to its conserv-

ative American members. A Presbyterian church in Minneapolis has several valued Syrian members. A Syrian is an officer in one of the most important churches in Indianapolis. For lack, however, of the welcome which Protestant churches are too apt to omit to offer, many Syrians, staunch Protestants in their own country, drift away from religion. In California, where there are now 400 Syrians practicing professions,

DR. MARY SALLOM.
A Syrian physician of Philadelphia.

there is not a Syrian church of any sect or denomination, all Syrians attending American churches or none. The more generous welcome given to all immigrants in the west, as compared with the east, for the most part keeps the Syrians of that part of the country from growing away from religion.

Not only Protestants but members of the other sects are ready to attend American churches in default of their own. Roman and Greek Catholics and Maronites are apt to ally themselves with the Roman Catholic church, Orthodox Greeks with the Greek church where it exists, or—where they find a welcome—with the Episcopal church. It is worthy of note that a certain Dakota farm colony, breaking up for reasons which do not appear, but probably to secure educational advantages for their children, and removing to an adjacent town, moved their church building with them.

If American churches of those denominations most nearly akin to Syrian religious habits and beliefs would be more hospitable, they would not only find these people, as a very few have already done, faithful and capable workers, a source of inspiration and illumination, but in return would be able to help them to correct those deficiencies in the practical application of religion to life which are the natural result of religion conditions in Syria.

An interesting illustration of the best that America has to offer to its Syrian population, and the best that its Syrian population is capable of giving back to America, was given last April, when a reception was offered to Dr. and Mrs. Daniel Bliss by the Alumni, former students, and Syrian friends of the Syrian Protestant College, of which Dr. Bliss was the first president, holding that office

for more than thirty years, and resigning it eventually into the hands of his son, Dr. Howard Bliss. Though among the company then gathered in Kalil's restaurant were many prominent Americans who are interested in the welfare of Syria, the exercises were entirely in the hands of Syrians, and the addresses would have done credit to any gathering in New York city. Especially noteworthy was the love and loyalty manifested toward Dr. and Mrs. Bliss, toward the college, toward Syria, and, in hardly a less enthusiastic degree, toward the adopted country.

There is, however, grave reason to fear that the good which these people are capable of bringing to us may be aborted by the indifference and contempt of that large proportion of Americans who do not know them. They are in every way so different from ourselves, so comparatively little is known of their country and conditions, that it is not easy to induce Americans to interest themselves in Syrian immigrants sufficiently to understand them, and this indifference must and does react unfavorably upon them. There is pathetic cogency in the appeal of one of the most successful and socially acceptable of this race, speaking for his fellow-immigrants: "Don't misunderstand them! Give them the opportunities given to other races, and you will find them capable of a high development, of a very bright future."

SYRIAN FARMSTEAD NEAR LAWRENCE, MASS.

SOUTH END HOUSE CADDY SCHEME

CHARLES F. ERNST

An all-summer outing for the boys of settlement clubs, one which provides for a large number under almost ideal conditions and pays its way—this would seem like the beautiful empty dream of an irresponsible hour. Yet this is what may fairly outline a going enterprise just closing its fifth season. The South End House has since 1907 provided and directed the caddy force for the golf links at the two great hotels at Bretton Woods, in the broad valley at the base of Mt. Washington. For two years, the colony was under the direction of John P. Whittman; since then the writer has had charge. That this service is appreciated on its business side is shown by the fact that it is referred to in the circulars both of the Bretton Woods hotels and of the Boston and Maine Railroad.

At first, from the settlement point of view, it was feared that there might be demoralizing influences, particularly in connection with the method by which the boys should be compensated for their work. As to this and all other matters, the hotel management has heartily cooperated with the settlement toward conserving the boys' moral interests and promoting educational results.

The caddy service was formerly supplied by boys from the neighboring towns in New Hampshire, supplemented occasionally by recruits from the city. The total lack of organization and supervision under this system left the caddies practically free to do as they pleased, and they were not only irregular in their work but were frequently disorderly. The need of efficient service led the hotel management to seek co-operation with some organization capable of supplying discipline and supervision. The South End House was interested in supplying vacations to city boys, and out of this joint need came the "Bretton Woods Caddies."

The plan has been successful beyond hopes. The hotel has secured a body of well trained boys under careful supervision. Improved living conditions

have been provided, as it has been demonstrated that the outlay is returned in improved service. The piano is no longer considered a luxury nor the matron a concession to sentiment. The management allows the caddies the use of its most exclusive ball-room for a concert, provides hayrack rides, and together with the guests has in some instances provided prizes for athletic competitions and automobiles for trips to the "Old Man of the Mountain" on Franconia Notch.

The boys—to the number of sixty or seventy each season—are benefited by two solid months of good air, good food, wholesome companionship, and something real to do, which are the best possible elements in the vacation of any normal boy. Caddying is practically free from danger and exposure; the hours are short; the work, while sufficiently taxing, is well within the strength of the boys.

The caddy scheme was successful at the start because it was organized within a neighborhood by a group of responsible people. The parents of the boys were at first doubtful about letting their sons go away all summer. The White Mountains suggested a remoteness from civilization that held some terrors; to this was added the ever-present tenebrous dread that children away from home might be subjected to some form of industrial exploitation. Even though the neighborhood experience with the vacation houses of the settlement furnished a basis of confidence, there were questionings during the first summer, and the lot of those who stood sponsor for the experiment at the city end was not wholly an easy one. Gossip and misrepresentation from the camp gained energy with every mile they traveled. A story of sickness, bad food, or unkind treatment precipitated tempests not easy to allay. This parental interest has proved a great asset in the end, however, for the boys now know not only that they have committed themselves to experienced leaders but that there are satis-

fied parents in the background. This force at home is invaluable in securing strong, easily carried organization in the mountains.

The boys are prepared for their duties by means of illustrated lectures showing the scenery and physical geography of the mountains; and friends at first explained the duties of a caddy and described the various golf equipment. After the first year the boys themselves were both ready and anxious to air their knowledge of sticks and the game; this has made formal instruction not so necessary.

Each summer there have been, however, substantial developments in the standards of intelligence, skill, consideration, and watchfulness with which the specific business of caddy is performed. This is the result of the constant supervision on the part of the directors, with many helpful suggestions coming to them and directly to the boys from the players. This year a plan for reducing the number of lost balls met a good response from the boys and has shown very satisfactory results.

The management is in the hands of the leader of boys' work in the settlement, assisted by one or two young college men and a matron. The leader must necessarily have at heart as well as in hand the welfare and individual interest of each boy; the assistants must be first of all good fellows; and the matron must draw upon all the feminine virtues, for she is called upon to nurse every ill from a cut to homesickness, and to create anything from a special dessert to the music that soothes the high spirits of the day into the bed-time mood.

The caddies are quartered at the Bretton Inn, a three-story building originally occupied by the farm hands and laborers of the hotel company. It is situated a half-mile from the hotels, and thus the caddy colony is free to establish and enforce its own standards. One might expect that the task of providing eating and sleeping quarters for so large a group would give the Inn an institutional cast, but the rooms are homelike; a play-room, parlor, open fire-place, and piano contribute to this effect. A covered porch twelve feet wide fronts the

inn and becomes practically an outdoor assembly room, especially in the evening, when it is well lighted by various colored electric globes; and a lawn with flower beds and a flag-pole lend dignity to the house. The hotel management supplies the food for the inn on the basis of a menu prescribed by the matron.

The director of the scheme serves as head caddy, and an assistant is the master at the second of the hotels. The daily routine is necessarily somewhat arbitrary. At seven a bugle-call summons the boys to morning exercises and to shower baths; another call at a quarter before eight announces breakfast; and a third at half-past eight starts the boys to work. The caddy master at each hotel assigns the individual boys to the golfers and is responsible for all caddy appointments. The morning work is usually finished at half-past twelve, so that the boys have time to take a dip in Lake Caroline (which lies a short hundred yards from the inn) before dinner at one o'clock. The afternoon until half-past two is generally free, and most of the boys sit on the porch watching the mountains change shape as the clouds pass over the range. Some caddy has had an experience in the morning, "his man," as the boys term the guests, being at the extreme a weird player or a runner-up to the champions. Or perhaps he played with a newly invented club or an imported ball which had peculiar advantages on the drive or on the ground; or it might have been that while looking for a ball lost in the long grass the caddy had discovered a bird's nest and "his man" had shown him how to mark it so that the next player would not tread upon the eggs. A bugle-call postpones the stories and the boys return to the links. Supper comes at half-past six; then music, stories, letters home, and a clinic for the sun-burns, cuts, and other little ailments, until time for "taps" at nine o'clock.

The boys find keen interest and great stimulus in associating with the men for whom they caddy. The guests at Bretton Woods are largely successful business and professional men; primarily good types of the "man of action." Most golfers take a real interest in their cad-

THE SWIMMING POOL.

dies, and as a caddy is with his patron approximately six hours a day for two weeks or a month, it is easily seen that the boy is unconsciously greatly influenced. Almost to a man the players show a sense of responsible consideration for the boys, particularly because they understand and appreciate "the scheme," as the boys always call it. They respond very fully to the suggestion that the caddies be paid simply at the regular rate for each round; though when a boy has served the same man for a period of weeks, a gratuity seems from any point of view not unreasonable. Some golfers make a real effort to ascertain the boy's character, means, and resources, and will often endeavor to map out with him a course towards a successful life. Such interest frequently continues through the winter by mutual correspondence. It is no rare thing for guests to visit the boys at the inn in the evening and relate their personal experiences, often full of hard-won battles through

the ranks of the industries. The inspiration from such talks fires the boys with ambition and resolution; and each year a number who otherwise would have gone to work enter high school. Of twelve boys who have been at the mountains during the four years of the experiment, seven are in high school, and four of the five who are working are employed by the men for whom they caddied.

Next to the influence of guests is that of the camp organization. During the first year of the experiment the group was small, and it was considered in the light of a family with the director as the head. He made the rules and was responsible for their enforcement. The group has now become so large that the "family" is a "community," with corresponding responsibilities on the individual. While the director is still practically the head, theoretically he is the chairman of a committee elected from their number by the boys. The com-

SOME OF THE CADDIES.

mittee of last year drew up a set of rules full of that originality which is the outgrowth of boys' idealism combined with a first-hand knowledge of one another's hopes and failings. The committee almost unanimously voted the adoption of the "by-laws." The work of the committee was at first largely executive and then for lack of other business became purely administrative. It met once a week to consider cases of boys who had offended by infractions of the rules, and imposed black marks, a certain number of which meant discharge from the camp and return home. After a few sentences were passed the community conducted itself so that offenders were very scarce. The committee then announced that white marks would be given as "credit for any exceptional act of volunteer service." This substitution of positive for negative government met with a whole-hearted response.

The committee handled all petty complaints either by removing the cause of the disturbance or referring the matter to the department which it concerned. When a lad complained that he was being made the victim of practical jokes, the persecutors were ferreted out and admonished. If a boy considered the cocoa not sufficiently sweetened, the butter over-salt, or his room poorly cleaned, the matron was asked to look into the matter. All complaints from the guests

or the hotel management were decided by the committee. The director, as chairman of the committee, presided, explained the business, and called for the opinion of the community. The policy is wholly democratic up to the point where self-education of the boys in real democracy has made them capable of applying it properly both to themselves as individuals and to the community as a whole.

During the season just closed an encouraging gain has been made in the sense of responsibility among the older boys for the younger ones. This tendency was much stimulated by the promotion for the latter part of the summer of one of the most experienced caddies to be caddy master at one of the hotels—with a change in the mode of address used by the entire group toward him from "Chick" to "Mr."

One big fact which lies at the foundation of the whole scheme is that the boys are in the Bretton Woods to work. They themselves realize that their personal success depends upon their value to the hotel management and the guests. The complex social and business relations between the guests, the manager, the leaders, and the boys themselves tend to develop and to train personal and group interest, cleanliness, reliability, independence, politeness, sociability, knowledge of team work, and a desire for fair play. With but few exceptions the boys are earning their first money, and the sums are therefore larger than they are accustomed to handle. Here, as in the case of government, the situation was first treated in the light of a family arrangement, the director taking the money from the guest, paying the boys' expenses, and returning the remainder at the end of the season to the boy himself or to his parents. Gradually, as the boys learned the value of money in terms of something other than sweets and pleas-

ures, they were given more responsibility. Now the director is banker and the community is depositor. In a few instances the boys have undertaken to be their own bankers, paying to the director only enough for expenses; but after one or two boys had lost their hoards this method of saving was practically abandoned. Each boy has a bank-book in which every item of expense, board, laundry, postage, and miscellaneous expenditure is recorded, as are also his deposits. The boys themselves know that their community is not subsidized and that they must work to live, and work regularly. The boy who does not earn enough to meet his expenses is discharged and sent back to Boston; and the boy who works one week and loafes the next, even though he has made enough to meet the expenses of both weeks, is apt to merit discharge because of some misdemeanor committed during his idle time. The practical application of the parable of the talents is clearly recognized by the boys, when they see that the caddy who works every day is gaining experience, which enhances his value, and the caddy who is idle becomes less reliable in the opinion of the caddy master.

At the beginning of the season the boys are urged to have some definite reason for saving their money, such as a gift to their parents of a ton of coal, a needed article of clothing or furniture, a month's rent, or perhaps a suit of clothes for themselves. The general response is a race to see who can reach his goal first. After the goal is reached, or failure threatens, the boys generally wish to spend a little money on themselves, and after this desire is satisfied another effort is made to reach or go beyond the goal which has been set.

The boys report at noon and again just before supper to deposit earnings, or, if they have no money, to give the reason. This gives an opportunity to keep track of what each boy has been doing during the day, and especially to become acquainted with individual characteristics. Thus it was revealed that two boys had made an agreement to sacrifice everything to earn as much money as possible. They were the first to leave the inn and the last to return. They

seldom played ball or golf, and were constantly on the watch for chances to increase their income by blacking boots, digging worms for bait, etc. Not content with this strict application, they began to give up their noon meal because they found that some of the guests played regularly from twelve o'clock till two and had no caddies. The whole story came out when at evening they turned in unusual sums of money. A boy who failed to hand in his usual amount reluctantly explained that his room-mate had been unfortunate in not getting a job and he had given him "his man." On the other hand, a boy occasionally becomes tired of caddying by reason of prosperity. Such a lad is generally not loafing but merely desires a change of occupation. If he can be spared from the links, he is allowed to devote his energy to chopping wood, building a raft, or taking pictures, as his fancy may dictate.

The caddy scheme attracts and provides for all sorts of boys, even those whose energy and roughness make them undesirable in ordinary boys' camps. The real proof of the value of such mingling of characters is the appearance of a distinct type, combining individual qualities. In addition there are the broader lessons taught by the everyday life. Especially useful is regularity of work, play, eating, and sleeping, supplemented by careful supervision; this not only insures health, but brings many to realize that it is just the lack of regularity and care which is responsible for their comparatively poor condition through the winter.

Organization of the boys' own play is one of the most vital elements in the caddy scheme. A boy will work somewhat in the hope that he may play, and when he finds his work is taking up his playtime he frequently ceases to work, although he may still give time to an employer. The boy who has ample opportunity to play will be a factor in his employer's chances of winning a match, whereas the same boy deprived of an opportunity to play will merely carry the bag round the course. Even the prospect of money does not create a working spirit. Play alone produces the

desire to work, and in return work makes the play more real. The boy who does not play says his job is "too much work," and the boy who does nothing but play finds real organized play "too much work." It is this old but too often forgotten philosophy of both work and play that has to be put in practice in order that the boys may be truly happy and helpful. Naturally the play has to be directed, so that it will not conflict with the work either by interfering with appointments between the employer and the caddy or by rendering the boy unfit on account of over-exertion. Base-ball and track sports are therefore not well adapted to this camp. The fact that there are few games or meets serves to make the occasional match of more intense interest to both players and spectators. Swimming and golf are the sports particularly adapted to the situation. The close proximity of Lake Caroline to the inn not only insures safety but makes it convenient for the boys to go swimming without fear of missing the bugle-call for meals. The management has granted the use of a splendid pool in the Mount Washington Hotel for one evening each week. The most popular swimming "hole" is the natural cut of the Amononsic River just below the falls. Golf is even more adaptable, in that no preparation is required. Clubs are presented to them, and the boys have constructed a crude but very sporty nine-hole course in a large field across the road from the inn; and here they spend nearly every leisure moment matching their ability or trying to work out new styles of playing. The great advantage of the game is that there is just as much fun for the boy who wants to play alone as there is for those who need competition to furnish excitement. The experience which they acquire by playing on their own account makes them more capable and valuable as caddies. Aside from athletics, the mountains and the woods exercise great and continuous fascination, and hardly a day passes without a group asking permission to build a camp or to tramp over some one of the surrounding ranges. At least once a year the new boys and as many others as can be spared from the links climb the Ed-

mands Trail up Mt. Pleasant and over Franklin and Monroe to the Tiptop House on Mt. Washington. It is the star event of the season; it marks the day of the boy's first big conquest; and the experience thus gained forms the background for what will be among the best of life-long remembrances.

Two-thirds of the boys spend their evenings in the piano room. The other third busy themselves with games or letters home. At about half-past eight the boys who want to hear a story retire to their rooms and prepare for bed. Then the leader announces whose room is to be the "story room," and the boys assemble there, to be introduced to Conan Doyle, Poe, Scott, Stevenson, Cooper, Kipling, and others whose writings are comprehensible to city boys only when they become acquainted with the rough wildness of the woods.

Another opportunity to learn something of the boys' natural bent presents itself on rainy days when everybody is forced to stay indoors. Some boys welcome the chance to write unusually long letters, or bring their bank accounts up to date; others pass the time playing cards and games. But to the majority a rainy day corresponds to the Sunday of a great many artisans; two of the boys bring out their violins, another his cornet, others request the matron to try over a song with them, and there are always those who can neither play nor sing but make up an attentive audience. Another group with a leaning toward drawing or painting will assemble in a room hastily fitted up as a studio, and here again there will always be a certain element of kindred spirits interested enough to sit quietly or serve as models if needed. Then there are those mechanically inclined who whittle out models of golf clubs, draw plans for a hut, or develop pictures. Still others spend the whole day decorating their rooms with pictures cut out of the magazines or Sunday supplements, or strip branches of balsam fir for pillows. A final group comprising the boys who want to read or hear a story is the largest of all. Thus the director, instead of dreading a rainy day, feels, as he is called into this or that room to view a successful film, or pass

judgment on a sketch or the effect produced by changing a picture from one position to another on the wall, that the day has been one of real recreation.

The boys enjoy a new and valuable experience when at various times during the summer representatives of the settlement visit the camp. The caddies then have the opportunity to play host. The boys take great pride in the camp and in explaining the country round about.

One of the most vital things about the caddy scheme is the way in which the summer activities lead up to and follow out of those of the winter. The boys are selected from the clubs and classes of the settlement, their election depending upon the evidence which they give not only in the club, but also in the public school and on the street, of their ability to make the most of the advantages pertaining to the mountain plan. It is as if each caddy were the winner of a scholarship which he may hold until he becomes ineligible because he has moved out of the neighborhood, gone to work, or fallen below the standard. While the number of seasons that a boy may go to the mountains depends upon supply and demand, it is safe to say that a majority of the boys in the neighborhood will each have had at least one year in a caddy group by the time they are sixteen years of age. Thus since 1907, out of one hundred and fifteen different boys, twelve have been in the group for four years, twenty-one for three, thirty-two for two, and fifty for one year. Eighteen of this whole number have moved from the neighborhood, but the rest are connected with the settlement. Working boys are not entirely excluded; for in the busy weeks of August and September the boy can earn enough at the mountains to pay the expenses of transportation and his board during his week or fortnight of vacation. This season the older boys saved their vacations until September, to supply a sufficient number of caddies after the school boys returned to the city.

The caddy force is organized during the winter into several groups; one of grammar-school boys, another of high-school boys, another of working boys under sixteen, and another of alumni who are over sixteen or who have en-

joyed the caddy privilege for four years and hence are ineligible as candidates for another all-summer position.

The caddy influence carries over into another group of those who have never been to the mountains but are prospecting for the chance. These lads are tested on the basis of lessons objectified in the caddies, and their individual and club standards of organization are thereby raised. The boys in both groups meet together occasionally through the winter to consider club and neighborhood questions and especially to plan for the following summer. Gradually the whole boys' organization, the year round, is being controlled by a spirit of pride and loyalty which acts as an incentive for right-minded boys and a check against those who would like the caddy privileges without complying with the standards. Nor is the spirit of tolerance and helpful consideration lost sight of. Each year as a matter of grace a few boys whom the caddies will not sanction are included in the summer work by the directors, with the hope that the change in environment will induce sufficient development to make them capable of entering the full comradeship of the group.

The caddy system is thus taken out of the catalogue of interesting methods of summer vacations for city boys. It is to be compared rather with the organized school camp as part of a broad system of education. Extending over those years in the life of the boy when influence is most vital in forming character, it has succeeded in fostering the desire for a standard of living and of morals higher than but not apart from that of the neighborhood in which the boys live. Beside development of a new individual type, it has created an enlightened gang loyalty, with a changed attitude toward citizenship, the first fruits of which are to be seen in a more friendly and more closely unified neighborhood. In connection with a distinctly new spirit of public responsibility which is developing in the neighborhood, the two most hopeful forces are, on the one hand, the caddy alumni and, on the other, the parents of the caddies, who all feel they have the evidence that the scheme of the settlement is real.

A BANNER OF THE RAILWAY STRIKERS.

ENGLAND'S REVOLUTIONARY STRIKE

GRAHAM TAYLOR

The strike of England's transportation workers not only marks but is making a new epoch in the industry of Great Britain. This epoch, now in the making, is so new, came so suddenly, developed such paralyzing power so quickly, and is so portentous in its far-reaching results that it startles the nation and the world. No one knows what to make of it. Employers never had to cope with such a situation before, and are wondering whereunto it may go. The British Cabinet and Parliament are evidently baffled by its complications and the possibilities of its almost certain recurrence. The working people themselves are manifestly surprised, as by an unexpected discovery. Even those who brought about the concerted action of so many organizations and individuals are pausing before the new power they have evoked, much as people do before a new power-producing invention, or as a child cautiously yet expectantly handles a new mechanical toy which he has

seen "go off" only once. The British Trade Union Congress was certainly scared away from the discussion of it at first, when it met at New Castle the week after the truce in the strike was declared. Its leaders made no provision for bringing the situation up for consideration or action. Notwithstanding the rule that only such matters as are sent in two or three weeks in advance can be placed upon the "agenda" of the Congress, or can be submitted by resolution for action, the discussion was forced from the floor. Although speech was free and bold, here as always in England, action was as cautious and conservative as the minds of the 500 delegates were uncertain and divided.

This fact that the movement which issued in the strike was so spontaneous, so unpremeditated, so much more moved by the masses in the ranks than by the leaders, and, therefore, so little understood, makes it all the more impressive. Like all mass movements, this one is

to be accounted for more by general conditions than by the specific grievances or by the immediate occasion which may seem to have given rise to it.

NATIONAL SYMPTOM OF UNREST

Indeed, it would be unjust to English conditions to account for this uprising solely upon the ground of the grievances which merely gave occasion for it. It cannot be understood apart from the very prevalent unrest among the world's manual wage-workers to which it gave a local, yet national, expression. Whatever the immediate occasions for this unrest may be in different lands, however the local situation and grievances may differ, whithersoever the movements of this unrest may tend under differing political and economic conditions, it has a common origin and a common goal. This world-wide unrest has its origin in the world-wide spread of aspirations which increase the wants of the people. Its common goal is a larger share in the product of the common toil and larger control of the conditions under which the working people live and labor. The dominant motive and aim of their struggle is for a higher standard of living and better working conditions. By a strangely common impulse, yet without international organization, or even an understanding between any of them—except the socialist minorities—the ranks of the industrial peoples of Spain and Italy, Belgium and Holland, Germany and France, England and the Scandinavian countries, Australia, New Zealand, and America, and even of the poor peasants of Russia are seething with discontent, and with a fixed determination to share more largely the increasing wealth of the world and the better conditions of human life which they think they are producing. For this they have enlisted in a war without discharge. If all signs fail not, the twentieth century comes in with a people's movement more widely revolutionary than that with which the eighteenth century went out. Its second decade is freighted with greater portents than even the year 1848.

This general background must be kept constantly in mind in order to under-

stand the forces in action on any foreground. Moreover, the vast changes which they are tending to produce, and toward which only the initiative has yet been given, must be forecast if the present play of these forces is to be estimated at their voltage power.

THE FORE-RUNNING STRIKES

As far as could be learned from extended interviews with leading Liberal and Labor members, this in brief is the story of what happened on those two eventful days, Friday and Saturday, August 18 and 19. It is told in the terms of the acts and speech of those who not only were close to the situation, but were part of it.

Long prior to these dates both the seamen and the dockers at all the ports had made their final stand for higher wages and changed conditions. Their strikes had not only been threatened, but had been called. The great passenger and freight liners were already tied up at the docks for the lack of coal and because their cargoes could neither be loaded nor unloaded. Meanwhile the government had been actively negotiating through its Board of Trade, both with the companies and the unions of their men, for the resumption of work on the basis of new joint trade agreements between them. Peace had just been negotiated, through the successful mediation of G. R. Askwith, head of the Labor Department of the government Board of Trade. For his service in securing this peaceful settlement Mr. Askwith has since been knighted by the king.

To John Burns was appropriately entrusted the announcement to the dockers that they had been granted what they had asked for and could go to work on the new terms at once. His appearance as a cabinet minister on the very scenes in East London where years ago he led the first great dockers' strike was dramatic. Then he faced the situation, as well as the police and the soldiers, with only his rough, undisciplined, newly organized, yet devoted following of poverty-stricken, desperate men behind him. Now he faced the strongly organized, well-led dockers' unions, with the agreement of their employers in his hand and

the guarantee of the government to back it up. His reception by his old associates was watched with keen interest to see whether he had lost his hold upon them since he became a minister of the crown. But on his appearance in their midst they flocked around his automobile as they used to follow his foot-steps. To the echo they cheered his congratulations upon "their bloodless victory" in their peaceful struggle for which "not a baton had been drawn by a policeman nor a soldier used in all London, with its vast population and acute differences amongst its people." Like a benediction of peace his words fell upon the scenes so full of stress and strain:

"May the higher wages so hardly won be wisely spent, so that the workers with their wives and children may from the vantage ground of better conditions rise to a still further improvement of their social and industrial lot."

FIRST GENERAL RAILWAY STRIKE

But no sooner had this declaration of peace relieved the high tension of the public mind than the scene suddenly shifted from the docks and ships to the railways and their freight handlers. Before the seamen manned their ships or the dockers got under their accumulated burdens, the four great unions, including the engineers, firemen, guards or trainmen, and the "goods" or freight handlers, gave twenty-four hours' notice of their intention to declare a strike if the companies would not meet representatives of these unions to discuss changes in the conciliation boards, whose operation was unsatisfactory to the men. The railway managers promptly and peremptorially declined thus to "recognize" the unions, declared their satisfaction with and determination to stand by the conciliation agreement of 1907, and claimed their ability to maintain an effective, however restricted, service with the protection which the government had assured them.

PRIME MINISTER'S ULTIMATUM

Then the administration took what it supposed to be its final preventive measure. The executives of the four rail-

way unions were summoned to Whitehall to meet the prime minister. After a prolonged conference, at the Board of Trade offices, Mr. Asquith delivered the government's ultimatum in announcing the intention to appoint a royal commission to inquire into the grievances against the conciliation boards, and warned the men that the government was fully determined and prepared to keep the railway traffic open. More by his manner than by what he said, the prime minister's attitude irritated the men and was resented by them. His language, moreover, was misinterpreted, by reason of a sensational announcement, attributed by the press to a prominent railway manager, that "every available soldier would be placed at the service of the companies." The executives of the unions thereupon refused to accept the government's basis for an agreement and retired in silence. On that same Thursday night the strike was "called" by hundreds of telegrams sent to all branches of the railway unions in the three kingdoms: "Your liberty at stake. All railway men must strike at once. Loyalty to each other means victory."

The response to this summons startled all England by its promptness and unanimity. By Friday noon the railway service began to be seriously crippled. Even before the trains stopped running passengers showed their disinclination to run the risk of taking them. By Saturday noon both the passenger and freight traffic was paralyzed. The docks, too, were still deserted. The vessels could neither discharge nor ship their cargoes. Their crews had not yet reported for duty. The "carters" or teamsters in London, Liverpool, and other great ports refused to deliver "goods" and baggage. Liverpool's municipal trainmen struck. The garbage collectors of that city disappeared from their rounds. London's subway trainmen abandoned the service. The coal miners in Wales started a "walk-out" which threatened to cut off the supply of fuel, as the food supply had already been menaced.

APPROACH TO GENERAL STRIKE

Such a situation had nearly existed in France and Russia, but it had never been

BEN TILLETT ADDRESSING STRIKERS IN HYDE PARK.

dreamed of as possible in England. Yet here the first country-wide railway strike was a grim fact. The "sympathetic" strike of the transport men on the waterways and of other trades had actually started. The "general strike" was partially realized to an alarming extent already. All the police force and military resources available had been called out and were in the field. Warships had been dispatched to Liverpool harbor. It looked more like civil war than anything Englishmen had seen since the "Corn Law" agitation confronted the Duke of Wellington's battalions. Moreover, a parliamentary crisis was imminent. For already the leader of the Labor Party in Parliament, J. Ramsay MacDonald, had served the chancellor notice of his intention to move a vote of censure upon the government for the way in which it had conducted the negotiations relating to the industrial strife.

ENTER—CHANCELLOR LLOYD GEORGE

Something had to be done, decisively and quickly. And Lloyd George, chancellor of the exchequer, undertook to do it, acting for the government hereafter

as the authorized representative of the prime minister. In response to Mr. MacDonald's formal request to appoint a day for moving the vote of censure, the chancellor proposed to reopen negotiations for the settlement of the strike with the leaders of the labor party in parliament. Mr. MacDonald, who had always striven for a peaceful settlement of the strike, summoned his colleagues forthwith that Friday. But when they met face to face this stern Scotchman insisted upon a categorical answer to just this one question: "Has the government urged, is the government urging, will the government urge the railway managers to meet the representatives of their employes for the settlement of the strike?"

The prime minister had declined to do more in this or any other way until after the royal commission to be appointed had rendered its report. The chancellor also hesitated, yet stopped short of breaking off the renewed negotiation. By turns he too appealed to the hope of a satisfactory settlement and to the fear of the forcible interference of the government. Neither appeal availed to change the deadlock.

GOVERNMENT'S CHANGE OF FRONT

Thus Friday passed. But overnight something happened to change the attitude of the government. No one outside the Cabinet knows what occurred to effect this change. Whatever it was, it indicated no change in the position of either the railway managers or the railway unions. It must have been something of moment to the government. It was rumored among members of Parliament that a diplomatic dispatch had been received by the minister of foreign affairs intimating that Germany was taking advantage of the preoccupation of the British Cabinet and army in their home crisis in order to increase its demands for more power in Morocco. However it is to be accounted for, peace began to dawn with Saturday morning's sun. The attitude of the three cabinet ministers charged with the settlement of the strike showed a marked change as soon as the conference was resumed. It was explained to the labor party conferees that the prime minister had been misunderstood. The "royal commission" was really an "urgency committee" which would be immediately appointed and convened and would report as soon as possible. The railway managers would meet the union representatives of the men. Overnight the summons upon these managers to appear the next day was sufficiently mandatory to produce their presence. They met. And before midnight on that eventful Saturday the joint agreement was reached, was signed, and was issued by government authority for publication.

Its terms were that the strike should terminate forthwith; that all employes involved in the strike or lock-out should be reinstated, no one to be subjected to proceedings for breach of contract or otherwise penalized; that questions in dispute be settled forthwith by the authorized boards of conciliation; that temporary provision for arbitration be made for the settlement of questions not conciliated; that both sides cooperate with the Commission of Inquiry to devise the best means of settling disputes.

But above and beyond these terms, the fact of most significance to the workingmen was that for the first time "recog-

nition" had been given their unions in the signature of the joint agreement by representatives of the railway companies, of the men's railway unions, and of the government Board of Trade. Forthwith the strike was called off, and the telegraphic summons back to work was obeyed as promptly and generally as the call to quit. Forthwith Parliament adjourned, after the stormy final session in which the breach was widened between the liberal and labor parties. Forthwith the Special Commission of Inquiry was appointed, convened, and began to take the testimony of the railway union men, the non-union railway employes, and the representatives of the railway companies. Such is the pending truce, during which all three parties to this serious struggle are only resting on their arms—except that extraordinary police and military preparations and precautions continue to be made by the government in anticipation of the possible recurrence of hostilities.

ROYAL COMMISSION OF INQUIRY

In this pause, so pregnant with issues that are certain to develop rapid and radical changes in policies, legislation, and political action, public attention is drawn to the daily sessions of the royal Commission of Inquiry, the Trade Union Congress, and the Labor Party Conference, and to the action of the railway companies, chambers of commerce, and other bodies. At these points are to be seen the manoueuering to gain any possible advantage in the class struggle that has only just begun.

The commission of inquiry sits in open session at the Board of Trade daily from ten o'clock in the morning to five o'clock in the evening. Testimony is widely sought and freely given by the railway union men, non-union railway employes, the officials of the railway companies and of the boards of conciliation. The personnel of the commission includes two able and conservative representatives of the labor interests; two strong men identified with commercial interests, one of them a railway attorney; and, in the person of the chairman, a representative of the government who has held many important official positions. Both the

witnesses and the commissioners are left entirely free from any restrictive rules of procedure to question and answer each other fully.

THE RAILWAY EMPLOYEES' CASE

The men's side of the case centers about three grievances. The first is the disparity between the rapid increase of the cost of living and the slower rise in the rate of wages. While all questions of wages and hours belong to the conciliation boards to settle, this underlying cause of discontent crops out upon the surface of every discussion of the situation, in and outside of the commission. A comparison of the government figures issued by the Board of Trade, the statements of railway managers, and the wages-census compiled by statisticians for the railway men's union yields the following conclusions: In the last thirty years wages have risen 6 per cent on the average, while retail prices have increased 17 per cent. In the decade 1899-1909, the rise in railway men's wages on the average has been only three farthings (one cent and a half) per capita. Between 1901 and 1910 the purchasing power of the sovereign fell 8 per cent, so that the railway employes on the average suffered an actual loss of one shilling per week during those nine years. This disparity between income and the cost of living is the greater when the low total of weekly earnings is taken into account; 134,000 railway employes receive \$5 or less per week; 107,000 over \$5 and under \$7.50; 78,000 over the latter amount. Of the engineers, firemen, passenger and freight trainmen, one-half receive between \$5 and \$7.50, and only a little over 11 per cent earn more than \$1 per day. In this discussion, fortunately, there are well authenticated figures to appeal to, for a comparative study of the cost of living and the rates of wages in the United Kingdom and in the United States and other countries has been made by the government Board of Trade. The timely appearance of the American statistics in Mr. Askwith's official report on the Cost of Living in American Towns gives an accredited basis for testing the facts ap-

pealed to both in this and the tariff controversy.

THE CONCILIATION BOARDS

The second grievance is the alleged failure of the scheme for conciliation and arbitration which has been in operation since 1907. It was established by the Board of Trade, through the instrumentality of Lloyd George, when he was president of the board. It was devised to avert a general railway strike which was then threatened. The principal railway companies and the Amalgamated Society of Railway Servants entered into the agreement it involved and obligated themselves to abide by its provision for seven years, and thereafter it is terminable only upon a year's notice given by either party. It provided boards of conciliation for the settlement of such differences over wages and hours as could not be settled by the parties at variance. These boards were constituted by the appointment by the employes from among themselves, and by the company, of one or more representatives each. In addition to these sectional boards which deal with the differences of certain groups, there is a central board of conciliation for each railway, consisting of one or more members from each sectional board, to which is referred on appeal any question not satisfactorily settled by the latter. In the event of the failure of this central board to decide the matter, it is committed for final decision to an arbitrator agreed upon by the two sides of the divided central board, or, in default of such agreement, by the speaker of the House of Commons and the Master of the Rolls.

The complaint of the men is not against the principle of conciliation and arbitration, but against the failure of the scheme to settle differences promptly and justly. This they charge is due to the alleged trifling and manipulation of the railway managements. Many instances of obstructive delay and failure to adjudicate the differences referred to these boards were cited before the commission by railway employes from all parts of the United Kingdom. What is considered the plain and persistent breach of the spirit of the conciliation agreement

of 1907 is alleged by the men to justify their strike, which broke its letter. They further claim that the conciliation boards have operated to reduce their wages one pence lower on the average than the rate prevailing the year before the scheme came into effect. Their loyalty to the method of arbitrating their differences has undoubtedly suffered a serious setback under the disheartening delays and discouraging ineffectiveness which they charge against the operation of these boards during the past four years.

The third grievance and the one on which the final stand was made in agreeing to any settlement of the recent strike was the refusal of the railway managers to recognize the unions by meeting their representatives to confer over the situation. Recognition or a general strike were the alternatives laid down in the ultimatum of the men and their parliamentary leaders.

THE RAILWAY COMPANIES' CASE

Representatives of the railway companies before the Commission of Inquiry stoutly maintained their allegiance to the conciliation agreement and charged the unions with an open and inexcusable breach of their contract, three years before its term expired. They denied that more than 27 per cent of the railway employes eligible for membership are actually identified with the unions or represent the non-union employes. They claimed that the railways had made a great concession in relinquishing to arbitrators their right to control wages and hours, in order to secure the agreement of the unions neither to strike nor to demand recognition during the contract term of seven years. They insisted that recognition of the unions would destroy discipline and increase the power to call strikes and stop traffic, and should therefore be refused as heretofore. They were willing to amend the act regulating conciliation boards so as to expedite their decisions and increase their efficiency. They proposed to make striking a penal offence as a means of securing compliance with the decisions of the boards of conciliation and of the arbitrators. This was justified on the ground that continuity

of railway work is in the public interest and that the same loyalty to the public should be legally demanded from railway employes as from soldiers and sailors. They neither denied the employes' complaints of the delays and failures in adjusting grievances, nor referred to the disparity between the cost of living and the rate of wages in accounting for the strike. But it has already given impetus to the Labor Party's campaign for the national ownership and operation of railways. Thus before the commission as elsewhere Greek met Greek, indicating only "the tug of war."

ARE UNIONS CHANGING FRONT?

If the government changed front in bringing about this truce for the settlement of the issues which occasioned the strike, just as surely are the British trade unionists doing so in the tactics to which they are resorting. The historic policy by which the trade unions of the United Kingdoms have grown into power and set the type for the constructive action of the labor movement in other lands, and especially in America, has suddenly been set aside, at least for the present crisis. The autonomy of the separate trades has hitherto been tenaciously held as the unit of their policy. But the joint action of all the railway unions substitutes action by industries for that of the specialized or "sectional" trade unions. The all-comprehensive transport workers' federation became a fact before it was agreed upon or ratified by many unions. The "sympathetic strike" so suddenly evolved the class consciousness of "solidarity" that it has become the watch-word of a new crusade. This strange strike transformed the representative character and method of the English labor movement, for the time being at least, into the "syndical" plan of action—the class acting en masse through "syndicated" trade unions—which has already become a well established and widely developed labor policy on the continent of Europe.

Thus almost over night the most radical change in the spirit, method, and policy of British trade unionism was

sprung upon old England. That it was the spontaneous movement of the rank and file and was neither premeditated nor expected by the leaders was evident.

BLOWING OFF STEAM IN HYDE PARK

Hyde Park, as usual, was the first touch-stone to tell the feeling of the men. This great safety-valve was as wide open as ever. On the Sunday afternoon following the midnight declaration of peace, marching bodies of the striking railway men began to arrive on the park's great lawns, headed by bands of music and carrying the picture-banners of their unions. By two o'clock 25,000 or more of them had gathered in great groups around the wagons that served as platforms for the speakers. No restriction was placed upon their presence or their freedom of speech. Only a few policemen were in sight. Here as everywhere the self-restraint, patient good-humor, reasonableness, and tact of the hard-worked and often hard-beset London police once more established their reputation for the best control of excited crowds.

This mass meeting, which was called as a council of war while the strike was on, turned out to be a ratification of the peace which, to every one's surprise, was declared over night. The railway union leaders were moderate in their tone and without bitterness in their speech. The crowds of men, who cheered to the echo every reference to their loyalty to each other in united action, were orderly, good-natured, and apparently grateful and hopeful over the plans and prospects for a peaceful adjustment of their grievances. They greeted with equal applause the summons "back to work tomorrow" and the call upon their railway unions to join the Transport Workers' Federation. "From sea and river, road and rail" they promised to unite in the one brotherhood of the one industry.

OLD vs. NEW TACTICS

The Trade Union Congress at Newcastle was another index of the attitude of the old unions to the new and hitherto untried mass movement of British labor. For forty-four years this

From Illustrated London News.

"TOMMY ATKINS" ON STRIKE DUTY.

affiliation of unions had been growing increasingly conservative, and now the officials of the congress and leaders on the floor hesitated to take any position. The chairman made only a passing allusion to the winning of recent strikes. The report of the parliamentary committee failed to assume any pronounced attitude. But the rank and file were not to be silenced. Occasion was readily found to open the discussion. It was forced, as was the strike itself, by the lower paid, unskilled, and less permanently organized men. The talk they started was radical. There was a most marked tendency to revert to the strike as the first instead of the last resort. Even Shakespeare's lines were forced into new application:

Let those now strike who never struck before,

And those who always struck now strike the more.

Such rallying cries were raised as, "No more sectional strikes or lock-outs;" "let all strike or none;" "federated trades must act as whole industries, not as separate unions."

LIVERPOOL'S MOVING FORT.

From Illustrated London News.

The "armored" motor shown in this picture was used by the police to escort prison vans and for other strike duty. The photograph was taken on Scotland Road.

A labor member of parliament was rebuked for introducing a bill forbidding strikes until after thirty days' notice, just "when we are only beginning to see how effective a strike may be."

But the action of the congress was never the less conservatively slow and cautious. And yet its delegates unanimously voted to call conferences of "sectional" unions in specialized trades to organize all the unions in the industry into a federation. The consolidation of the Trade Union Congress and the Annual Conference of the Labor Party was also initiated. These far-reaching initiatives, however, did not satisfy the more expectant majority. They expected, with the editor of the widely circulated weekly *Labor Leader*, "a clear ringing note of militance and inspiration, . . . a sense of burning indignation, . . . a bold ringing challenge of the government's at-

titude, . . . a discovery of the value of the sympathetic strike which had come as a revelation to the workers." They felt with him that "it is impossible to disguise the fact that the congress as a whole failed to do justice to the situation." On the other hand the conservative leaders who are in official control of the Trade Union Congress, together with the strongest men representing the Labor party in Parliament and the leaders of most of the strongest unions, expressed satisfaction with the cautious deliberation and minimum amount of general discussion with which the congress, as a whole, assumed its attitude and took action relative to the situation. Their sentiment was voiced by Thomas Burt, M.P., who is recognized and revered as "the grand old man" among the leaders.

"The present movement may do good,"

he said, but he repeatedly warned them that "the general and national strike is a dangerous weapon; the poorest of the poor are the first to suffer and suffer most acutely." Nevertheless he admitted that "national and sympathetic action means a shorter fight."

On the contrary, the men who express the feeling of the more radical rank and file refer to the temporary agreement arranged by their parliamentary leaders as a "surrender of the strike, at the very rise of its overwhelming power . . . the railway men's Sedan. . . . Suddenly, tragically; and farcically the nation has passed through the greatest industrial crisis in its history . . . "what should have been the climax of the industrial upheaval has been turned into an anti-climax by the terms of settlement." Nevertheless, J. Ramsay MacDonald insists that this settlement, which he negotiated, is "all that could be provided now—an opportunity through the methods of collective bargaining to present their case for advances and improvements in their conditions. The railway servants will now do exactly what other trade unionists have to do—and that for the first time in the history of railway trade unionism. The railway companies now see that wages must be advanced and conditions improved. The strike convinced them that preparations had to be made at once for improvement."

REVOLT AGAINST CONSERVATISM

The dissatisfaction with the attitude and action of the Trade Union Congress already takes the form of a revolt against its leaders. The *Labor Leader* declares "this old, unheroic spirit" to be "the great drag on the labor movement. . . . Never can it do itself justice till this spirit is utterly cast out."

Even Philip Snowden, one of the ablest representatives of the labor party in Parliament, declares:

"At the close of the congress the country was still left in ignorance of the real attitude of the responsible leaders of the unions to the new revolutionary methods. The recent unrest has been a movement of the rank and file, who have led the leaders. The old trade union leaders have not courage to

put themselves in opposition to the revolutionary tendencies, or place themselves at the head of the movement."

Of course the small but active minority of socialists are going a great way further. They say, "We told you so." They take for granted that trade unionism will be seen to have proved itself inadequate, that its labor party is only a tool of other party politicians, that the sympathetic strike and syndicating unions by industries is half-way socialism, and that only a straight-out socialist party can and will assert and gain the rights of labor. Varied and forcible utterance was publicly given to this revolutionary spirit and tactics by the actual leaders of the strike "at the front" in Liverpool. Ben Tillet, who, although heard with indifference in the Trades Union Congress, is a most effective open-air agitator, expects his Transport Workers' Federation to lead the way to the class solidarity of the working people.

"The movement was a spontaneous up-rush from below," he said. "There was no organization in the ordinary sense. If there had been it would have failed. The ordinary trade-union leader would have been too cautious. The rank and file came in with a rush. One class after another joined hands with extraordinary unanimity and spontaneity, making common cause as a band of brothers. It was splendid."

On this same occasion, however, he deprecated violence and the general strike.

"We felt and said from the first that our cause was injured by anything that savored of violence. Those who talk so lightly of paralyzing everything have no responsibility."

Yet Keir Hardie talked just so.

"The only course to be taken at Liverpool is to paralyze everything," he declared. "Let every working man drop work and sit tight, using no violence, making no demonstration; simply let him refuse to do a hand's turn of work for any one. It is the only thing to be done . . . The old revolutionary spirit which seemed to have died out in the time of the Chartists seems to have revived in our midst. It is a most welcome and delightful sur-

prise to me. It is a revolution that is brewing, and it is going to come. And, as the next step, let them paralyze everything."

Tom Mann, who, as leader of the strike at Liverpool, was dictator of the city for a week, went beyond the limit, still further.

"We don't care for your public opinion," he said to William T. Stead. "We do not ask for your sympathy. You have failed—failed utterly—to abolish poverty. All your churches, all your governments, all your institutions, all your laws have failed. You are an admitted failure, all of you. But, by Heaven, we are not going to fail. We are going to abolish poverty, and to do it ourselves, without asking the help of any but ourselves."

By contrast, the trade unionism of the British Congress and the American Federation of Labor is surely the conservatism of the labor movement. And so far the choice lies between these two tendencies, other than which there is no third as yet in sight or in prospect. It remains to be seen which will win the ascendancy. In England, as in America, it will depend upon the strength and progressiveness of the conservative leaders, and the encouragement they get in counteracting the effect of the repression of legitimate trade unionism, by which their followers are driven to dangerously radical extremes. If the leadership of Tom Mann and Keir Hardie supersedes that of such men as J. Ramsay MacDonald, Thomas Burt, Arthur Henderson, and John Hodge; if the spirit and policy of the Trade Union Congress are abandoned for the aims and methods of the European syndicalism or socialism; will it not disrupt and disintegrate the organized labor of England? For these radical movements are not likely either to transform the conservative characteristics of the British working-people, nor to modify their methods quickly enough to fit the hitherto inherent conservatism of all Britishers, before the disruption of the trade union constituency would occur under the stress of the transition. How such a sudden transition can take place without civil war not even the genius of the English peo-

ple for evolution within constitutional limits gives any assurance. But if the better type of seasoned leaders can still lead the new enthusiasm among the rank and file for united effort, a constructively progressive policy would be practically irresistible in its realization of democracy through legislative and economic advance.

We have let these events and those who enacted or personified them speak for themselves. Our single purpose has been to reproduce the stirring scenes and speech, seen and heard or, better still, narrated in personal interviews by a very few who themselves were identified with the turns of affairs in Parliament, in the strike council of cabinet ministers, in the hearings of the Royal Commission of Inquiry, and in the leadership of the strike. Our readers may thus be in better position to interpret for themselves not only these swiftly moving events described but also their more widely significant issues which are sure to follow in England and elsewhere. These critical issues are to be looked for in industry, in politics, and in religion.

THE INDUSTRIAL ISSUE

On the labor side of the industrial situation, we have already raised the questions: Will this epoch-making strike make for a reaction toward the safe, slow-moving, accredited trade unionism which has been more in accord with British constitutional methods? Or will it develop the "syndicalist" policy of the revolutionary labor movement in France? Or will it lead still further afield into the German type of Socialist Party politics?

On the part of the employers and investors in labor-employing interests there is as yet apparent chiefly their silence in their alarmed surprise at the overwhelming power of the general strike. So far it has been broken only by a few personal or formal demands upon Parliament to penalize the strike in public service employment; and to rescind the legalizing of "peaceful picketing" in the Trades Dispute Act of 1906. The under-paying of transport workers is denied by few, and the increased rate of wages secured by seamen and dockers

Fred Leist in London Graphic.

AN EFFECT OF STEAM UNFORESEEN BY JAMES WATT.

This cartoon is an allegory of the great strike and shows the worker holding up the mighty mechanism. The figure of Stephenson is seen seated beside the legendary kettle which is said to have given such epoch-making ideas to his great predecessor, James Watt.

and demanded by railway men is not considered excessive. British stock markets and volume of trade stood the strain of risk and loss remarkably well.

Consols fell $\frac{1}{4}$, home railway stocks

not more than $\frac{3}{4}$, and a few industrials $\frac{1}{16}$. The Government Board of Trade reported for August 373,615 employes directly involved in trade disputes, as against 17,305 in this month last year;

2,323,800 working days lost, as against 140,300 in August last year; 228,600 employes received a net increase of \$47,000 per week in wages, and 30,000 teamsters and lightermen in London had their working hours reduced; but 130,000 coal miners and 4,700 blast furnace men suffered a reduction of their wages. Nevertheless the volume of trade fell off surprisingly little and in trades other than those affected directly by the strike employment was almost as good as in July.

THE POLITICAL ISSUE

In politics the issue is imminent and acute. The Liberal government depends for its majority in Parliament and therefore for its continuance in power upon the votes of the Labor Party. Nevertheless, it could not have done less to preserve the peace and restore order than it did and yet claim to be a government at all. At Liverpool, and among the mixed races in the mining population of Southern Wales, life and property were in great peril. Yet the use of the army there and the extraordinary military precautions and plans now being projected, and the proposal to increase the police by a large volunteer force to be available only in emergencies, are deeply resented. This and other collisions with the Liberals threaten an early disruption of their alliance with the Labor Party, and their consequent retirement from power. To this the Labor Party is indifferent. For while it has little to expect from the Conservatives, it expects a great increase of votes at the expense of the Liberals, and it hopes ultimately to succeed them as the progressive party of the nation. In any event the political sphere in England, and also in America, as it is in Germany, is to be the arena of the struggle for industrial democracy.

THE FINAL APPEAL TO RELIGION

Into the religious sphere of thought and action the struggle has already entered. The churches, as Dr. F. B. Meyer, revered leader of the Free Church Council, publicly proclaims, cannot keep out of it if they would. For not only are their own ideals and standards of life and relationship involved, but also

those of a large and influential part of their own constituencies. In their membership are many wage-payers and captains of industry indeed, but far more wage-earners and labor leaders. It would surprise American church people to find so many of the national and local leaders of England's trade unions in the membership, official positions, and active work of the churches. Pages of THE SURVEY could be filled with the names and services of these labor leaders who are lay preachers, at the head of church brotherhoods, prominent in adult Sunday Schools, leaders in temperance and missionary work. Scores of these more prominent leaders hold a "Fellowship" to express their common religious aim and enjoy religious friendship." On their "Labor Week," held for the last two years, these men publicly express their views on the relation between labor and religion. More loyalty to Christianity and dependence upon its faith and power are never expressed in church assemblies than was avowed by these leaders now most prominent as heads of their unions and as labor party members of Parliament.¹ This "Fellowship" is described by a London citizen prominent in social work as having a spirit of religious earnestness and determination like that of the old Covenanters.

In any event, and on either side of any dividing line, such men as these must be reckoned with in the future, as they always have been in the past. Without them and their leadership any advantage gained for labor by methods which they could not follow is sure to be more temporary than permanent, more apparent than real, more productive of reaction than progress. So, without the ideals and spirit of religion leading and supporting the people in their coming struggle for better conditions of life and work and for a more democratic control of them, there will be spasms of blood and tears, instead of a steady, progressive, irresistible movement for the certain attainment of human rights and opportunity for all.

THE
SURVEY
SOCIAL CHARITABLE CIVIC

VALLEY OF DESOLATION.
FLOOD-SWEPT SITE OF AUSTIN, PENNSYLVANIA.

Seventy-six people needlessly met death when the dam of the Bayless Pulp and Paper Company—a fifty-foot wall of concrete just beyond the mill stacks—broke on the afternoon of September 30. The work of relief among the survivors and the sanitary control of the littered valley was under way within twelve hours, directed by State Commissioner of Health Samuel B. Dixon.

That was the first duty of Pennsylvania. The second is to place the responsibility for this disaster and to take such steps as will absolutely prevent a recurrence here or on any other of her mountain streams. A like obligation rests on every other American commonwealth in which waters are impounded without adequate public regulation and supervision.

The state that could not learn a lesson from Johnstown has now a second better chance to lead the way to safety.

Emergency relief work and prompt sanitary control have followed the desolating flood which swept the little valley of Austin, Penn. on Sept. 30.—P. 991.

A new national body, known as the American Federation for Sex Hygiene, has been launched. The executive officer is Charles W. Birtwell, who on October 3 closed a service of twenty-six years with the Boston Children's Aid Society.—P. 991.

With Francis H. McLean at its head, the new National Association of Societies for Organizing Charity has divided work with the Charity Organization Department of the Russell Sage Foundation.—P. 993.

St. Paul, Omaha, Grand Rapids, Des Moines, Sioux Falls, Detroit, and Cedar Rapids are the cities visited this month by the "teams" in the Men and Religion Forward Movement. "Without any doubt," writes Fred B. Smith, "the greatest single advance we can make is to put intense religious enthusiasm upon the social service methods which are being employed so splendidly to-day." The work and aims of this movement are reviewed by Dr. Devine in his Social Forces in this issue.—P. 989.

The Chicago conference of the American Association for Labor Legislation caught up the threads of progress made in this field, and showed the impetus that has been given to the American movement for protecting wage-earners.—P. 998.

At the International Hygiene Exposition at Dresden this summer graphic exhibits embraced almost every field that has enlisted the service of the social worker.—P. 997.

The new Industrial Commission of Wisconsin, created by act of the last legislature, and vested with catholic powers to prescribe standards of safety for every place of employment, to order safety devices, and to issue mandates designed to protect the life, health, and welfare of employes, is a hopeful sign of the new social statesmanship of the Middle West.—P. 1001.

The trial of the McNamaras begins in Los Angeles this week, one year after the explosion which wrecked the *Times* Building.

Bonfire time: poke your nose in at the door of any primary school room in any small town in the land. Every small boy is a sachet of burnt leaves.

October 1 was the date set by the resolution passed at the annual meeting of the Steel Corporation last April for report by a stockholders' committee on labor conditions. The resolution was offered by Charles M. Cabot of Boston as part of his campaign among stockholders, with the idea that the labor policies of the management should be put before them for criticism and backing in the same way

SOCIAL FORCES

BY THE EDITOR

MEN AND RELIGION

Not as Presbyterians, Baptists, Lutherans, or Methodists; not as Evangelicals or Trinitarians; not as Anti-Catholics, or Anti-Semites, or Anti-anything whatsoever; but as positively and directly interested in the social welfare, we extend a hearty welcome to the present forward movement in the Protestant churches which has taken the name of Men and Religion Forward Movement. We do not know whether it will prove to be the greatest religious movement since the Reformation; but this is certain, that its influence should work for unity in spirit among the great historic religions rather than for enmity and division such as the period of the Reformation was compelled to witness. We do not know whether its effect upon foreign missions will be to hasten the substitution of the name of Christ in the orient for that of Mohammed and Buddha, as sixteen hundred years ago the Roman emperors turned from their pagan gods to the religion brought by the oriental missionaries; but this is certain, that Turks and Hindus and Chinese are in our own immediate world; and our religion will stand or fall by its ability to help us in defining our relations to them and to all "strange peoples."

Boys' work, bible study, evangelism, social service, and missions are the specific features of the movement. Of these we are naturally concerned primarily with the fourth. Recognizing the interrelation of the five departments, and the importance of all of them, it is still a source of special satisfaction that the leaders in this forward movement have definitely put into their program this demand for tangible evidences of the sincerity and permanence of the local response to their campaign. Revivals we have had and religious awakenings which were as ephemeral as they were emotional; superficial in their methods, transitory in their influence, negative in their effects. This is not because they were emotional. All religion appeals, and rightly appeals, to the emotions. It is rather because they have not given fruitful direction to the emotions. All true religion seeks a two-fold outlet: in worship and in service. Christianity as a historic religion holds man to worship and to service. That which we worship is the noblest conception of the spirit of man, the highest in power and in good will, revealed to us through the teachings and traditions of the church, through the prophecies and gospels of the sacred books, through the sacrifices and victories of heroic souls, and supremely through the life and teaching of Jesus of Nazareth. This worship of the highest and best, however imperfect the conception of it may be, is the beginning of a religious character. Revivals are necessary and are justified, as far as they go, because they mark for many this elementary beginning of a religious character which may develop infinitely here and hereafter. But worship, however devout and however redeeming, is not the whole or the main part of religion. Sincerity, humility, and courage, which Frederic Almy found to be the most impressive qualities of the leaders of the Men and Religion Forward Movement in his three days at the Silver Bay conference, are the natural fruits of a devout spirit. If the leaders can impart these qualities to the

October 14, 1911.

989

multitudes with whom they will come into direct and indirect relations throughout the winter, they will be preparing the soil for a great religious harvest. Devout worship makes men sincere, humble, and courageous, and without these elements there is no religion.

As, however, this forward movement is to be more than a revival, more than a week's campaign, more than an emotional appeal, its leaders have naturally sounded as its distinctive keynote, service to fellow men. This is but to put in its natural place the very essence of the Christian religion which is the spirit of service. Social workers must assume this spirit. Religion generates it. If that which goes by the name of religion does not bear fruit in the improvement of social conditions, it is evidently misnamed. No mere enlargement of the nominal number of church members, no multiplication of religious organizations, is convincing evidence of the growth of religion. The rehabilitation of broken families, the diminution of drunkenness, the reformation of criminals, the transformation of slums into homes, the lifting of the burdens of the oppressed, the enlightenment of the administration of justice, the disappearance of social bitterness and unrest, the socializing of business, of industry, of the professions, of government itself, by the penetration through them all of the spirit of service, sustained and fortified at all times by the spirit of justice—these are evidences of religion in any community.

As the leaders have recognized, it is not enough to enumerate these and other specific duties of this kind, as any evangelist might do, and then lightly dismiss them. Here, as in boys' work, missions, and other departments, knowledge and experience must be brought directly to bear upon the impressionable minds of converts and awakened church members who would bring forth works meet for repentance. The reformation of criminals, for example, is not to be accomplished by preaching a sermon to them, by visiting them in prison, or even by extending a hand in utmost sincerity, humility, and fraternity. These may be desirable features of a process of reformation, but the whole process goes much farther back, and reaches much farther forward. It embraces probation and parole, suspended sentence, indeterminate sentence, and appropriate occupation in confinement. It is closely related to the school problem, the recreation problem, and the housing problem. It takes the Christian who would prove his faith into the prison cell, to police court, to legislative committee rooms, and to many other curious places. This sounds discouraging; but it is not, for there are everywhere at hand some people who have worked out these relations of the various aspects of social reform and who are ready to come forward on request with their specific plans and remedies, which the individual church member may adopt or reject without unreasonable demands upon either his time or his intelligence. Some of these movements are within the church, but that of itself does not make them more religious. Some of them are inter-denominational, and these may give the best possible scope for the service which seeks the greatest needs and the greatest and most legitimate rewards. Some are distinctly secular, and the worker who cannot recognize in these also the opportunity for genuinely religious service would do well to seek a new baptism of the spirit of Him who, on Sabbath days as on other days, found it lawful to do good rather than to do evil, to save life rather than to destroy it.

THE COMMON WELFARE

SEX HYGIENE FEDERATION ANNOUNCES ITS OFFICERS

On October 3 Charles W. Birtwell closed a service of twenty-six years with the Boston Children's Aid Society, to become the executive officer of the American Federation for Sex Hygiene, which is now in process of organization. The announcement of the federation's policy and program, which have not yet been determined upon, will be made in an early issue of *THE SURVEY*, together with a review of Mr. Birtwell's long service in the field of work which he is leaving. He is succeeded by J. Prentice Murphy, superintendent of the Children's Bureau of Philadelphia.

The Boston headquarters of the federation are to be at 6 Hancock avenue. The New York office is at present in the Pullman Building, 17 Madison avenue. The officers of the federation include Charles W. Eliot, president emeritus of Harvard University, honorary president; Prince A. Morrow, M.D., president; Major Henry L. Higginson, treasurer; James J. Hill, R. Fulton Cutting, and Col. George Goethals, vice-presidents. The permanent executive committee will include Dr. Morrow, President Eliot and Dr. Henry P. Walcott of Boston, Cleveland H. Dodge and Felix N. Warburg of New York, and Mrs. Caroline B. Alexander of Hoboken. Among the members of the advisory council will be Bishop William Lawrence of the diocese of Massachusetts, Dr. Arthur T. Cabot and Robert A. Woods of Boston, John M. Glenn and Homer Folks of New York, and Bleecker Van Wagenen of Orange, N. J. It is anticipated that persons of similar standing in other cities will become allied. The present executive committee, under which the organization is being effected, includes Dr. Morrow, Prof. Robert N. Willson, M.D., of the University of Pennsylvania, Delcevare King of Boston, Thomas N. Hepburn, M.D., of Hartford, and Donald R. Hooker, M.D., of Johns Hopkins University.

AFTER THE DAM BROKE AT AUSTIN

Merely the chance circumstance that it happened in daytime instead of in the middle of the night prevented the great flood at Austin, Penn., from involving an even greater loss of life than the six hundred first reported killed. So rapidly was the town overwhelmed on September 30 that, although warning was given as soon as the waters burst from the dam some two miles away, hundreds of people barely had time to escape to the hillsides, while seventy-six were caught in the death swirl. The fatalities could scarcely have been less than twenty times this number had the disaster come without warning in the night.

The water cut a swath so clean through the narrow floor of the valley that except for a pile of debris banked against a few brick buildings on one side, and another pile jammed in a clump of trees, scarcely a projection of wood or brick is visible for acres where there had been 245 buildings. But wreckage extends in a ragged fringe along the base of both hillsides and is strewn for miles down the valley past the little village of Costello, which contributed fifty houses of its own to the grinding mass, though only three people to the list of victims. The horrors of the situation were increased by fire, which broke out in the ruins.

The state of Pennsylvania turned quickly to the aid of the survivors. Within a couple of hours after the disaster a county representative of the state Department of Health was on the ground and caring for the wounded. On his own initiative, Governor Tener being absent from the state capital, Dr. Samuel G. Dixon, state health commissioner, sent a relief train with surgeons, physicians, sanitary engineers, and nurses, which was at the scene by early Sunday morning. A relief train with food and clothing, in charge of officers of the National Guard, dispatched by the adjutant general, and two troops of state police also arrived early on Sunday morning.

After a conference with the burgess and town council a survey of the situation preparatory to the work of relief and the recovery of bodies was rapidly made.

With only eleven wounded—though three of them seriously—to care for in the providentially spared hospital, the problem was essentially one of sanitary engineering and systematic relief. Headquarters were opened in a lodge hall, and the ground floor of the building was turned into a commissary in charge of the nurses. While the health officials were establishing a supply of pure water, getting the gas company to resume the supply in the undemolished part of the town—gas had been universally used as fuel for cooking—and planning the removal of débris so as to find the dead, the nurses prepared food and on Sunday afternoon carried a distribution throughout the town.

The houses left standing on the hill-sides and in a valley tributary to the flooded one included a number of dwellings which were unoccupied on account of the slackness of work. There was therefore sufficient shelter for all the survivors, including the 900 homeless, without using the tents brought by the National Guard relief train.

Philanthropic agencies were early on the ground. Ernest P. Bicknell, national director of the American Red Cross, arrived on Sunday and found the situation so well handled by the state health authorities under Dr. Dixon, who came to assume personal direction, that Red Cross help was unnecessary. The Pennsylvania State Board of Charities was represented by its executive officer, Bromley Wharton, and an assistant. The Children's Aid Society of Pennsylvania, through a special agent, H. M. Peck, stood ready to help solve the problem of dependent children. But this phase of relief, and indeed the whole problem, was less difficult than it might have been. For a comparatively small proportion of the dead had been bread-winners and all but a few of those had been single men, or their families had been killed with them. The community, moreover, is predominantly American—composed mostly of self-reliant people whose relatives and friends, many of them in near-

by Pennsylvania towns, were glad to open their doors and help find new work. Already a considerable number of survivors have said good-bye to the desolate spot which once was their home town.

For weeks, however, relief work must be kept up in Austin, and the state authorities—who are feeding the whole town—hope that the generous contributions of money and supplies, which the railroads are transporting free of charge, will be continued. Pride is taken in the ability of the state to care for its own unfortunates. Although many of the townspeople have already left, the presence of several hundred laborers sent in to work on débris removal means a commissary problem for some time to come.

The concrete dam which is responsible for the disaster was completed by the Bayless Pulp and Paper Company less than two years ago. When first filled with water—only a month after completion—it cracked in several places and slid eighteen inches on its foundations, the top bulging to the extent of thirty-two inches. At that time—January of last year—the people of Austin fled to the hills and many camped out for two or three days. The pressure was relieved by dynamiting two holes at the top of the dam so as to lower the water. Although it appears that recommendations looking to the strengthening of the structure were made by the designing engineer, there is no apparent evidence that much was done except for the provision of a gate at the top of the dam and an eighteen-inch valve at the bottom. The dynamited holes were filled up and it is reported by eye-witnesses that when the disaster occurred the gate at the top was closed and the dam overflowing. This failure to strengthen the dam adequately was severely criticized in last week's issue of the *Engineering News*, which reprints an article, published in March, 1910, discussing the slip of the January preceding. No state authority seems to have had jurisdiction over the construction or condition of the dam. The act creating the state water-supply commission limited its supervision to streams which have been designated as public highways (i. e. navigable streams and streams used for logging purposes).

An inquest was started by the district attorney on October 6, but after formally determining the cause of death its hearings were indefinitely adjourned pending a search for legal authority to compel the superintendent of the Bayless Company to testify. His unbroken silence after the disaster culminated at the inquest with the familiar "On advice of counsel, I decline to testify." Yet this witness was not only the superintendent in charge of the mill and dam, but the president of the town council of Austin.

FORWARD MOVEMENTS IN THE FIELD OF ORGANIZED CHARITY

A division of work and plan of co-operation have just been worked out between the new National Association of Societies for Organizing Charity and the Charity Organization Department of the Russell Sage Foundation. This working agreement should enable both agencies to become very effective instruments in the co-ordination of charitable effort in this country. Francis H. McLean leaves the department to become the head of the new association, with Maurice Willocks of Birmingham as his associate. Fred S. Hall, formerly with the Pennsylvania Child Labor Committee, becomes associate director of the Charity Organization Department.

The association has opened an office at room 421 in the United Charities Building, New York. Those who deplore the multiplication of national movements cannot accuse this one, at least, of undue precipitancy, for the first of the charity organization societies was established in this country thirty-four years ago. They have taken their own time about achieving a national birth, but then the death-rate among associated charities and the agencies that under various titles are doing similar work is very low and their national organization will probably be equally hardy.

Mr. McLean has himself pointed out that an associated charities is very hard to kill, and that it is important, for this reason, to see that the new ones are well born.

"What has happened in the past," he writes, "is that these societies, when narrowly conceived and growing narrower as little almsgiving associations, have not kept their feet on the ground, but have sunk them in a marsh, so that sometimes only the head now is above the mud. . . . A marshy society is less inspirational than one soaring in the upper ether of generalities, but neither one is an associated charities."

Many of the more active societies had escaped both dangers, of course, and these had been feeling their way toward united missionary effort for some years. Their first active field work was begun in 1907 under the auspices of the publication committee of THE SURVEY, and was supported by the Russell Sage Foundation. Mr. McLean had charge of this work from the beginning, and its success is largely due to his generous vision and patient, careful working out of each detail. Two years ago, the work was taken over by the Charity Organization Department, with Mary E. Richmond as director and Mr. McLean and Margaret F. Byington as field secretaries.

Since October, 1907, over fifty charity organization societies have been assisted by field visits to organize or reorganize. Others have been assisted by correspondence only, but this method is very inadequate for a task demanding such careful inquiry into local needs. To get societies organized rapidly would not be difficult, but to study the needs of each locality and to subordinate growth to needs, the special propaganda to the general good, demands another type of service altogether. The Charity Organization Department has been able to render this service, and to develop the beginnings of other useful activities, such as case studies, a technical journal for the use of established societies, and a short normal course for the further training of charity organization workers.

The time is now held to be opportune for a division of these undertakings, for placing the extension movement under the auspices of the societies themselves, and for developing, under the department, the other tasks already begun. Under the agreement just effected,

the purpose of the new association will be "to organize and reorganize charity organization societies, and to promote their co-operative development"; that of the department will be "to study, teach, and publish in the charity organization field, bounding that field broadly to include the better co-ordination of all social service."

To quote one of the strongest leaders in the movement as to the working out of this agreement:

Judging the future by the past it is fair to assume that Mr. McLean and his assistants in the new association will, so far as possible, make field visits to communities about to organize associated charities. The appeal from these communities must come from the given place; there will be no pushing in uninvited. After forwarding the literature of the department and gathering as much data as possible by correspondence, after assurance that action would not be premature, a personal visit will be made, to follow up the clues already secured by letter. Sometimes such visits last a week or two, and must include a superficial examination of living and industrial conditions and many personal interviews with local people, before any meetings can be called. Separate reports have to be made, often, to different local bodies. A plan of organization will then be suggested, if the inquiry seems to justify it. No two plans have been exactly alike so far, but the points usually emphasized are (1) a *trained* paid worker, (2) a board of men and women truly representative of the *varied* interests of the community, (3) closest *co-operation* with existing agencies, (4) a program of case-work and of public service that aims not only to alleviate distress but to *prevent* it.

There is an equally important service to the existing societies, some of which are so backward as to need reorganization, and others of which, even the most progressive, are glad to avail themselves of the advice of those who see the field as a whole. Judging from the solid results already achieved, from the vigor of the new societies recently established, and the increased usefulness of the older ones that have invited field visits, the new association has a wonderful opportunity before it, and should have the generous financial support of all who believe in well co-ordinated social effort.

Under the continued guidance of Miss Richmond, with Mr. Hall and Miss Byington as associate directors, the Charity Organization Department will address itself to the following lines of work to be continued or begun: the working out, by a series of studies, of some case-work standards; co-operation in detail in such matters as transportation agreements, the inter-relation of national movements, and the securing of tests and standards for all the various processes of social service

agencies that deal with individuals; publication of the *Charity Organization Bulletin* and other propagandist and educational pamphlets; teaching case-work in the schools for social workers, and conducting the Charity Organization Institute; maintaining under the New York Charity Organization Society a practice district for case-workers.

The results achieved so far by the department in its case system of teaching and in its correspondence with charity organization societies about a wide variety of topics give promise of still wider usefulness, now that all its energies can be concentrated upon a group of closely related tasks. It is still at the service of the charity organization societies, but hopes, in addition, to be increasingly useful to those engaged in other forms of social service. The relations between the association and the department will be of the closest, of course, and there will be a constant interchange of tasks based upon the division of work here outlined.

THE PURE FOOD SHOW IN N. Y.

Would you rather eat pure food than food that is adulterated? Do you care to know how to tell the one from the other? Are you interested in cooking, domestic science, or home economics? Do you enjoy listening to free lectures, or eating pure food samples that cost nothing?

If so, you would have been glad to go to the "pure food show" held in Madison Square Garden, New York city, September 23 to October 4, and given by the Associated Clubs of Domestic Science and the *National Food Magazine*. To educate the public in the matter of pure foods was the purpose of the exposition. This was the second exhibit under the same auspices, and it is probable that an annual event will be made of it.

The aim of its sponsors was carried out in several ways. Over a hundred food manufacturers had exhibits with demonstrators. These ranged from a well-known brewer to a maker of shoe-polish. There were daily lectures on such topics as the Home-Made Loaf, Cooking With a Can-Opener, etc. The College of the City of New York maintained a laboratory where tests were continuously being made; for example, of baking powder for alum, or of paper drinking-cups for alum or soluble sulphites. The New York State Department of Weights and Measures had an instructive exhibit. September 29 was Philanthropy Day. A number of phil-

anthropic organizations had exhibits. The booth of the Women's Suffrage Party was flanked by that of the Commissary Department of the United States Navy, with male cooks.

CONNECTICUT PASSES SOCIAL LEGISLATION

The longest recorded session of the Connecticut Legislature closed September 26, after disposing of a mass of important legislation. The session lasted nine months. Among the bills killed the following are of interest to readers of THE SURVEY.

A direct primaries act; a law repealing the "fellow servant" doctrine; a workmen's compensation act; a bill granting suffrage at municipal elections and direct primaries to property-owning women.

A full list of the bills passed is not yet at hand. It will contain, among others:

A public utilities law; an act raising the limit for damages for death by accident from \$5,000 to \$10,000; a statute against black-listing, and other pro-labor laws; a number of statutes bearing on public hygiene; a law allowing a majority of voters in a no-license town to petition the county commissioners to allow sales of liquors in summer hotels; an act intended to secure for the consumer honest weight, full measure, and a knowledge of what he buys.

The public utilities law, which, a correspondent of the New York *Evening Post* declares, "signalizes the relaxed hold of the corporations on Connecticut's law-making body," abolishes the railroad commission, and gives to the public utilities commission jurisdiction over railway rates, and over steam and street railway, gas, electric light and power, telegraph, telephone, and express companies. What is declared radical for a New England state is a provision in the nature of a "recall," by which the attorney-general of the state must, on petition of a hundred voters, take steps to determine whether the commission, or any member of it, is incompetent or guilty of misconduct. If either is proved the penalty is removal. It is thought that the constitutionality of the bill is open to question.

Both houses of the legislature were democratic and the governor is a repub-

lican. Tradition was broken by the house assuming a conservative temper, while the senate became radical.

CHILDREN ON THE COLORADO STAGE

The Jones Child Labor Bill, reviewed by Mrs. Kelley on page 996, is now the law of Colorado. During the past two or three years, owing to a Supreme Court decision, the former law regulating employment of women and children had been hopelessly defective. While few statutes can be obtained in such perfect shape as their sponsors would like, Judge Lindsey feels that the new Colorado legislation contains features which, if the experiments prove successful, should have more than local application—notable among them being the sections dealing with child labor on the stage. Not prohibition but regulation under a system of bonding is the method devised. Describing the scheme of enforcement under the new child labor law, Judge Lindsey writes in the *Denver News*:

Children are not forbidden employment in concert or theatrical performances, but permitted such employment on the express condition that "it shall be made to appear that suitable provisions have been made by the employer of such child for the protection of the moral and physical health and the education of such child."

Further provisions follow, permitting the school authority granting the permit in the first instance or "any person" in the interest of the child bringing the matter to the juvenile court to require a bond for \$2,000, with sufficient sureties, conditioned that any terms imposed as a condition to granting such permit shall be carried out.

Under this provision a teacher, tutor, nurse, or other care-taker may be provided the stage child, with a bond to secure enforcement of the condition. It is at least an important gain for the stage child over the present unregulated and unrestricted employment of children on the stage.

The permit thus granted may be revoked at any time by the juvenile court if its conditions are violated or if considered not for the best interests of the child. The act also provides that where conditions are such as to justify granting such permit, and where it is granted, the performances of such child shall be considered a part of its training and education. This recognizes the work of the willing, talented stage child as different from that mere drudgery of the unwilling and unprotected factory child. Such permits are to be kept on file at the box office of the theater and subject to inspection.

Experience will no doubt develop the real truth as to these various contentions as well as the necessity for some changes and strengthening of the law. Yet it is believed a law along this line with mandatory provisions, if such shall prove necessary, requiring security against violation in other states of conditional permits, and the establishment of a co-operation between the juvenile courts now in every large city in America in seeing to the rigid observance and enforcement of the conditions on which permits to stage children are granted, may prove an acceptable solution of about the only question concerning child labor that has threatened any division of opinion among the best known of those in this country who have been foremost in the fight against child labor, and the sincerity of whose different views in the matter of the stage child no one can honestly question.

If a good, fair try at regulation fairly and reasonably to safeguard the stage child should fail in spite of this effort to do justice to the stage children and the public, it may become necessary by law to prohibit the stage child.

EDITORIAL GRIST

COLORADO'S STAGE AND FIELD CHILDREN

FLORENCE KELLEY

Under the Jones child labor bill, recently enacted after a hard struggle, Colorado enters upon an interesting experiment in the care of stage children. This bill provides that permits shall be granted for stage children by the school authorities, who may require a bond to be filed with suitable sureties that any terms imposed as a condition to granting the permit shall be carried out.

In an article commenting on the new law, Judge Ben B. Lindsey says: "Under this provision a teacher, tutor, nurse, or other care-taker may be provided the stage child, with a bond to secure enforcement of the condition." Judge Lindsey points out that the number of stage children in Colorado is small, and that this concession to the theatrical interests was intended to facilitate the enactment of other urgently needed provisions for protecting children in mines and factories.

The spectacle of school authorities and court jointly granting a permit for stage work, and requiring a bond with sureties

for the cost of a nurse for a child young enough to need one, will be watched with alert interest by those friends of the children and the dramatic arts who have in Massachusetts, Illinois, Louisiana, and Oregon banished young children from the stage to the cradle and kindergarten. They will be keen to observe whether the Colorado experiment affords real protection to the traveling children. Especially critical will be the scrutiny of those who know at first hand the sorry failure of the licensing system in New York.

Interesting and new is also the provision that children working in fields, gardens, and orchards for persons not their parents must have permits from the educational authorities. This is intended to reinforce the compulsory education law and prevent the recurrence of abuses such as have been alleged to exist in recent years in the beet fields. Henceforth, children thirteen years old may work in the beet fields, under restrictions as to their hours, and with permits.

The new Colorado law contains the list of prohibited physically dangerous occupations common to the child labor laws of the industrially developed states, but unfortunately omits the prohibition of night work in the messenger service for boys between sixteen and twenty-one years. This "closed season" for minors is now in force in Massachusetts, New York, New Jersey, and Wisconsin. Conceivably the juvenile delinquency law may answer the purpose in Colorado, in the absence of large cities aside from Denver. This, however, like the bond and sureties provision for the stage children, can only be shown by the test of experience.

A horrifying clause is that which permits girls of ten years of age to vend goods in the streets. Even in sinful New York city girls below the age of sixteen years have for many years been effectively banished from the street trades.

All told, however, in spite of this blot, this new Colorado statute is a long step in the right direction. It tends to repair the damage done by adverse decisions of the state courts, which had for three years more or less completely invalidated the child labor law, and it adds to the child labor legislation of the nation new

censures in relation to stage children and to those employed in rural outdoor occupations.

INTERNATIONAL HYGIENE EXPOSITION

RICHARD KITCHELT

To the visitor to eastern Germany, whether scientist or sociologist, student or mere tourist, Dresden offered during the past summer in the International Hygiene Exposition a feast of easily assimilable information worth a journey half around the earth to partake of. A visit to the exposition impresses one with the conviction that the central thought of those who collected and arranged the exhibits was to instruct not only the medical man and scientist, by adding a little more abstruse learning to a mind already deeply informed, but to teach also the ordinary, average man, woman, and child the things which, if they knew them, would almost banish disease, pain, and misery from the world.

Every exhibit, while prepared with scientific accuracy and truth, was illustrated and described with a strikingness and simplicity which could not fail to appeal to the least learned. Comparisons were illustrated not with figures but with colored charts, when the actual objects or models of them could not be used. Exhibits did not lurk in dark cases waiting for the determined student to search them out. They stood forth and demanded the attention of the uninterested passer-by.

A great glass tank full of red fluid represented the amount of blood the heart pumps every twenty-four hours. Near it an iron ball on a lever, which the visitor could lift a limited distance, afforded an idea of the energy the heart uses with every beat. Mechanical illustration of the heart valves, anatomical specimens, models of diseased hearts, illustrations of the effects of occupations, exercise, and excesses on the heart, all pointed the one general lesson of how to take care of that important organ.

A large chart showing the membrane surface with which nose-inhaled air

comes in contact to be three-tenths greater than that which warms mouth-breathed air was one of many striking arguments for the removal of adenoid growths and against mouth-breathing. Other charts, models, and specimens illustrated the lungs, lung surfaces, lung diseases, the effects of breathing dirty air, of tight clothing, and of chest exercise.

A demonstrator before a large transparency of the human figure manipulated a series of electric switches so as to cause various colored lights to run back and forth along the nerve lines of the chart, illustrating to an interested group, as he lectured about nerve functions, the difference between reflex and volitional actions.

Every organ, part, and function of the human body was similarly illustrated and demonstrated. Ergographs were there for visitors to test their endurance. They could put their finger-tips under a little lever and watch an indicator-hand mark off their pulse beats. They could test the relative sensitiveness of different parts of the skin of their hands by touching it against little double points at various distances apart. They could look through innumerable microscopes at a great variety of specimens, forms, and preparations. Demonstrations rarely seen outside of the laboratory were provided for the public. Everything was free and open.

The perfect freedom with which everything relating to the human anatomy and its functions and derangements was displayed, without, apparently, any thought of impropriety, was most refreshing to an American accustomed to the interference of a narrow prudery with certain efforts to convey to the public information most vital to its well-being. The managers of the exposition evidently believed that, if "the proper study of mankind is man," no part of man is improper to study and nothing relating to him is wrong for everyone to know. In this same spirit the public seemed to receive the exhibits. No one seemed to gaze with any thought but to be informed; and men, women, and children from the ranks of the common people studied and seriously dis-

cussed exhibits of the most intimate parts and functions of the human anatomy.

After its simplicity and instructiveness, the vastness, exhaustiveness, and thoroughness of the exhibition most impressed the visitor. The ramifications into which the proper study of hygiene extended seemed almost limitless. It penetrated into almost every field that has enlisted the attention of the social reformer. Entire departments of the exposition were devoted to housing conditions, working conditions on sea and land, factory inspection and insurance, the relation of wages to disease, milk- and water-supply in our cities, women's and children's labor, schools, playgrounds and parks, smoke and noise. The bearing which all these have upon human health was shown clearly and in detail.

Much space was given to illustrating the medical and hygienic devices of savage races, and to ancient and medieval methods for combating and preventing disease. These sometimes showed a strange semblance to modern methods, though they were mixed up with the absurdest mummeries and superstitions.

Man's food and drink naturally formed an extended exhibit. All the standard foods and drinks were analyzed and their constituent parts shown in tubes, their adulterations exhibited, and their nourishing and warming values given. Potatoes were shown to be the cheapest food, in Europe at least, with rice a good second. Many popular fallacies were exploded; among others, the idea that chemistry might some day prepare a day's rations in such elemental form that a pill box would hold several meals. It was shown that each pill to maintain the consumer's efficiency would have to be about the size of a base-ball.

The effects on the human organism of alcohol and other stimulants and narcotics were fully illustrated. In this department an exhibit conspicuously labeled "Beer, the food-drink," compared the solid constituents of twenty-five cents' worth of beer with those of twenty-five cents' worth of bread. It showed the former to be about one twenty-fifth of the latter—and German beer is twice as heavy and half as expensive as the American brew!

Men as well as women crowded the room where the care of babies was demonstrated—how they should be held, washed, fed, dressed, and not rocked. There was an extensive display of cheap and pretty clothing, and of sanitary paraphernalia and appliances which were compared with the expensive and insanitary articles so frequently bought by poor people.

Of course, hygiene in the armies and navies of all countries and its evolution received much attention in a country where both occupy so important a place. Hygiene in land and water transportation and even a section devoted to air navigation showed the completeness and up-to-dateness of the exhibition.

Russia, Japan, Formosa, Hungary, Switzerland, Spain, France, Italy, and Brazil, and the cities of Paris and Amsterdam had buildings and special exhibits of their own. Other large buildings were devoted to commercial appliances relating (some of them very remotely) to hygiene. Public concerts were provided on the grounds, which formed part of a large public park, and the usual "midway" features were represented, though not extensively.

The exposition seemed to be very well patronized; yet all too few of the world's people saw it. It seems a pity that the whole affair is not to be transported from country to country and from city to city throughout the civilized world, to teach its valuable lesson in its forceful, simple way, for the improvement of that greatest of man's assets, his health.

CONFERENCE ON LABOR LEGISLATION

LUCILE EAVES

Those attending the Chicago Conference of the American Association for Labor Legislation were impressed by the substantial progress of the American movement for promoting the legal protection of the wage-workers. In addition to many members employed in the welfare work of large employers or connected with casualty insurance companies, there were present over fifty public officials who are engaged in administer-

ing labor laws in the United States and Canada. These officials came prepared to present the industrial problems of states as widely separated as New York and California.

In reviewing the work of the association during the fifteen months since the last Chicago conference, President Seager laid particular emphasis on its service in promoting the passage of accident insurance or compensation legislation. During this period ten states have enacted laws of this kind. These with the three states that already had such statutes make thirteen which are committed to this policy of greater justice to the injured wage-worker. In summarizing the provisions of these laws Professor Seager pointed out the tendency to adopt the elective rather than the compulsory type of compensation law. He said this was due to the decision declaring the New York compulsory law unconstitutional, and expressed regret that the stronger laws had not been tested in other jurisdictions, where they might have received a more favorable interpretation.

The exhibits and several of the best papers of the conference dealt with the prevention of industrial accidents. The first of these papers, by John Calder, formerly an inspector of factories in Scotland, gave a comprehensive summary of the reforms needed to bring the United States up to the best European standards. Our laws are weak in that they often make the factory inspector responsible for pointing out dangers instead of charging the employer with the obligation of making his place of work a safe one. They often fail because of omissions in the attempted enumerations of dangerous machines to be safeguarded. It would be wiser to specify dangerous elements common to many machines, such as intaking gears, pulleys and clutches, fly wheels, belts, etc., and call upon employers to protect workmen from all such risks. The manufacturers of machinery should be required by law to provide guards for dangerous parts. A greater effort should be made to enlist the services of mechanical engineers in the solution of the problems of constructing safety devices. A knowledge of safety devices and methods of work

should be taught in the trade schools. Mr. Calder emphasized the impossibility of attaining good standards in the United States until we shall have better trained factory inspectors and civil service regulations permitting a more permanent tenure of office.

The tendency of progressive employers to improve on the legal requirements in the provision of means for preventing accidents was well illustrated by the stereopticon lecture of Robert J. Young, safety inspector of the Illinois Steel Company. The members of the conference were shown pictures of the varied forms of guards, platforms, stairways, hand-rails, and warning placards devised for the prevention of accidents in the great establishments of this company. The means by which the workmen are enlisted in the effort to "boost for safety" are particularly interesting and worthy of imitation. Edgar T. Davies, chief inspector of factories for the state of Illinois, told of his work and suggested ways of instructing inspectors in the more efficient discharge of their duties.

The interest in the discussion of the second general topic of the conference centered in the new experiment by which Wisconsin simply requires that all places of employment shall be safe, and leaves the details necessary for making the law effective to an Industrial Commission of three members. Prof. John R. Commons, who is a member of this commission, pointed out the advantages of this method of administering and originating industrial legislation, particularly in the matter of the prevention of accidents. When, after a public hearing, the commission has issued its regulations, prosecutions are to determine merely the fact of a violation of an order. The question of the reasonableness of the order can only be raised in a suit against the commission, which must be brought in the county court of Dane county. This prevents interference by injunction with the work of enforcing the orders of the commission. The extensive powers granted this group of experts do away with the need of many forms of legislation for which the average law-maker does not possess sufficient special information.

The Industrial Commission has the means of collecting detailed information about labor problems; it may seek the assistance of volunteer boards of experts; it could create such a body as the Massachusetts Board of Boiler Rules; it could adopt the rules of factory inspection of another state; and it could formulate orders for the prevention of industrial diseases.

Another phase of the administration of labor laws by commission was illustrated by the history of the Massachusetts Board of Boiler Rules presented by the chairman of the board, Joseph McNeill. He outlined the earlier unsuccessful efforts to prevent the loss of life due to boiler explosions, and told of the work of the board in establishing standards that are being extensively adopted in other progressive communities.

The discussions on the Uniform Reporting of Industrial Injuries revealed our national backwardness in administering labor laws. John B. Andrews spoke of the enormous economic loss to the nation from preventable industrial diseases, and reviewed the work of the association in initiating legislation in this field. Bills to secure the reporting of such injuries have been passed in the legislatures of six states. The question of whether physicians should be paid a fee for reporting cases of illness due to employment called forth a lively debate. As such patients are often charity or poor pay cases, and as it is desirable to get the reports from physicians rather than from untrained observers, the weight of opinion seemed to be in favor of a small fee for making the required report.

The methods by which the Minnesota Bureau of Labor has obtained fairly complete accident records were explained by Don D. Lescohier. He suggested that the fear of publicity often prevents the making of reports and that this could be overcome by having detachable slips on the schedules. These identification blanks should be filed where they will not be accessible to the general public. He has found the clipping bureau a valuable means of learning of accidents. It is advisable to send letters to large employers at the end of the year inquiring

whether all accidents have been reported.

The discussion of the need of uniform schedules for reporting industrial injuries made it clear that the collection of authentic information is the prime requisite for progress in dealing with many problems that are now before the state insurance and compensation commissions and the casualty companies of this country. United States Commissioner Neill declared that the present lack of uniformity not only renders our industrial statistics useless for practical purposes, but has at times given positively vicious results. Edson S. Lott, of the United States Casualty Company, showed that those engaged in the business of industrial insurance would be greatly benefited by statistics enabling them to calculate the degree of exposure to accidents in different industries. He claims that compensation is much more expensive than the liability system, declaring that one in eight of those injured in this country obtain damages, while the ratio in Germany is one in four.

A comprehensive discussion of the reasons for the present demand for information about industrial injuries and the best methods of obtaining uniform schedules was given by Leonard W. Hatch, of the New York Department of Labor. He considers the American Association for Labor Legislation the organization best adapted to the work of bringing about the needed co-operation between state officials. The rapid expansion of the movement for industrial insurance in this country makes the need of reliable statistics imperative. He thinks the insurance companies and employers maintaining their own departments of insurance should be required to furnish information, and that they should adopt schedules uniform with those of the state officials. Statistics of this kind are necessary in order to estimate the cost of any proposed system of compensation. The lack of uniformity in our schedules shows the crudity of American work up to this time. It is possible to find this uniformity in the fundamental causes of industrial accidents, and state officials could easily co-operate in the formulation of a standard schedule that would cover all items of information needed.

In the informal discussion of items that should appear in such a schedule, Mrs. Florence Kelley suggested three points which should be included: sex, age, and the hour when the accident occurs. Commissioner Neill amended this by pointing out that the connection of fatigue with the accident could not be shown unless the hour of beginning work was also indicated. He suggested that the number of days at work on the machine should be given, as it seems probable that many accidents are due to lack of experience in using the machine causing the injury. L. W. Hatch, John R. Commons, Don D. Lescohier, L. W. Chaney, and J. B. Andrews were appointed a committee on uniform schedule.

THE WISCONSIN LEGISLATION OF 1911

WILLIAM M. LEISERSON

The Legislature which recently adjourned in Madison struck out many new paths in the legislative field. Controlled by the followers of Senator La Follette, urged forward by fourteen clever socialist politicians, this legislature has set marks in the progress toward better social and political conditions which must be gratifying to all the organizations and individuals who have been blazing the trail for our law-makers to follow. Progressive measures which have proved successful in other states have been copied with improvements wherever possible. And new experiments have been launched, the results of which are bound to affect the course of legislation in this country for many years.

For the social worker the act of greatest interest is, probably, that creating the Industrial Commission. Hitherto, to counteract each evil disclosed in our industrial life we have had to secure a new specific law. When fire-escapes were needed, or machines had to be guarded, laws were passed stating that fire-escapes should be built and guards provided. The Industrial Commission Law changes this; for it lays down the general rule that all places of employment must be safe and that every em-

ployer must furnish and use safety devices and safeguards "and shall do every other thing reasonably necessary to protect the life, health, safety, and welfare" of employes. Then it creates a commission of three to administer the law.

The Industrial Commission has jurisdiction over every place of employment, and is vested with power to ascertain and prescribe standards of safety, to order safeguards and safety devices, to fix reasonable standards for the construction, repair, and maintenance of places of employment, and to issue orders designed to protect the life, health, safety, and welfare of employes. Hereafter, instead of special laws being necessary, the commission will, after an investigation and a hearing, issue an order compelling the employer to install the proper safeguards.

The Industrial Commission succeeds the old Bureau of Labor Statistics, and is empowered to enforce all labor laws. It will have departments for factory inspection, arbitration, unemployment, statistics, child labor, and workmen's compensation.

The Workmen's Compensation Law avoids constitutional objections by making the plan optional. To induce employers to come under the act, however, the common law defenses of assumption of risk and negligence of a fellow-servant are removed. Employers of over 20,000 employes have already chosen to become subject to the compensation plan, and most of the others are merely waiting for the Supreme Court of the state to pass upon the law.

The scale of compensation is, (1) medical and surgical treatment free of charge to the injured employe, and (2) 65 per cent of the average weekly earnings, to begin on the eighth day after the injury and to last during the period of disability, but not longer than fifteen years. The total disability indemnity is limited to four years' wages. (3) In case of death the dependents are entitled to an amount equal to four years' wages of the deceased, to be paid in weekly instalments.

Following the example of Oregon and Illinois, the Legislature limited the hours of labor for women to ten per day and fifty-five per week. In case of night

work, only eight hours per night and forty-eight per week are permitted.

Wisconsin now takes its place with the states which limit the hours of labor for children to eight per day and forty-eight per week and prohibit night work. The child labor law was also strengthened by prohibiting children under eighteen from working in mines and in other dangerous employments, and by requiring that no child over fourteen who cannot read at sight and write simple English shall be permitted to be employed unless he is a regular attendant at a continuation or an evening school.

The Legislature recognized the supreme importance of vocational training and passed several important laws on this subject. A State Board of Industrial Education has been created, composed of three employers of labor, three wage-earners, the state superintendent of education, the dean of the Extension Division and the dean of the College of Engineering of the University of Wisconsin.

Every town of over 5,000 is ordered to create a local board of industrial education, and smaller places may do so. Whenever as many as twenty-five persons file a petition with a local board of industrial education that they desire to attend an industrial, commercial, continuation, or evening school, the board must provide facilities for such instruction. A tax rate of one half mill is authorized in each locality and the state will grant aid up to 50 per cent of what the local board spends.

Wherever industrial, commercial, continuation, or evening schools are established, all working children between the ages of fourteen and sixteen are required to attend them not less than five hours per week for six months in the year. The total time spent at work and in school shall not exceed eight per day or forty-eight per week.

An experiment that will be watched with interest is the State Board of Public Affairs. This board consists of the governor, secretary of state, chairman of the finance committees of the senate and of the assembly, and three other members appointed by the governor. Its life is limited to two years. This board is to employ experts to audit and install

accounting systems in all the state departments, in the University of Wisconsin, and in all public bodies such as boards, commissions, institutions, etc. It will be a bureau of economy and efficiency for the state. The board is also to investigate the resources of the state, and promote their development by encouraging farm- and home-ownership in the state, by investigating the cost of living and devising measures for its reduction, by co-operation, development of markets, etc. Finally, the board will eliminate waste by co-ordinating the work of the various state departments so that their investigations and reports will not be duplicating each other, and so that they will be conducted in an efficient manner.

Through the efforts of the Wisconsin Equity Society a law was passed to facilitate the organization of farmers' and wage-earners' co-operative associations. The scheme of co-operation is modelled after the Rochdale Plan, but 6 per cent profit on shares is permitted. No one may have more than \$1000 worth of stock, and but one vote is permitted to each stockholder. Dividends will be declared on purchases and on salaries and wages of employes.

A novel plan of government insurance was devised by the Wisconsin insurance commissioner and enacted into law. It provides that the state shall administer a "life fund" for the purpose of granting life insurance and annuities. The liability of the state is limited to the amount paid into the fund, so that the commonwealth merely acts as a sort of trustee. It is hoped that this will overcome constitutional objections. Premiums may be paid to any state depository, or to the treasurer of any city, village, or town, who will transmit them to the commissioner of insurance. Life policies in amounts of \$500 or multiples thereof will be granted to those between the ages of twenty and fifty who are approved by the State Board of Health and the insurance commissioner. Pensions of \$100 or multiples thereof, to begin at the age of sixty, may also be granted, and pensions may be taken without the life insurance. Loans may be granted on policies and any premiums not paid when due will be charged as loans. Pending a decision of

the courts on the constitutionality of this measure, the Insurance Department is developing the machinery for managing insurance funds by insuring all state and county buildings and property, which is clearly within the state's powers.

Beginning December 31, 1911, there will be levied a tax on all incomes earned by individuals, firms, co-partnerships, corporations, joint stock companies, and associations organized for profit. Individual incomes up to and including \$800 are exempt. So also are incomes of husband and wife up to \$1200; and for each child under the age of eighteen, as well as for each dependent, there is an additional exemption of \$200.

The rate of taxation is graduated, beginning with 1 per cent on the first \$1000, increasing $\frac{1}{4}$ of 1 per cent with each \$1000 up to \$5000, then increasing $\frac{1}{2}$ of 1 per cent up to \$12,000. Any income above this amount is taxed 6 per cent. The State Tax Commission will administer the law and assess all corporations. Individuals will be assessed by County Assessors of Incomes, under the supervision of the commission.

The income tax is designed to take the place of the personal property tax, which is a farce in most states. Any person who pays a personal property tax is to have this amount deducted from his income tax.

The legislature did not neglect conservation. An unpaid commission to investigate and recommend measures to conserve the natural resources of the state was created. Water-powers are declared to be public utilities and placed under the jurisdiction of the Railroad Commission. Franchises will be granted to companies desiring to build dams and use the water-powers, but the state reserves the right to manage, regulate, and control the power generated and the level and flow of the navigable waters. An annual appropriation of \$50,000 for five years is constituted into a Forestry Investment Fund, to be controlled and spent by the State Board of Forestry for the purchase of land as additions to the forest reserve and for reforestation. Similar to this is the State Highway Fund consisting of \$300,000 annually to be spent in improving the roads of the

state. A Highway Commission is created to administer this fund, to plan a systematic scheme of state roads, and to aid counties in building roads efficiently and make them fit in with the general plan.

The legislature passed resolutions to submit to the people constitutional amendments providing for woman suffrage, and for the initiative, referendum, and recall in state matters. The acts of municipal councils and county boards were made subject to the initiative and referendum, and 15 per cent of the electors may petition that an ordinance be passed by the council, or, if not passed, that it be submitted to a vote of the people.

A general incorporation law for cities of the second, third, and fourth class was passed, under which they may adopt a commission form of government. The plan provides for a commission of three, a mayor, and two other members, nominated and elected by the people for six-year terms. They are subject to the recall, however, on petition of 25 per cent of the voters. Ordinances are made subject to the referendum on petition of 15 per cent of the voters.

Self-government was conferred on cities by permitting them to amend their charters by initiative and referendum, and to call conventions to frame new charters and adopt them by vote of the people. Doubts have been expressed as to the validity of this law, since it delegates legislative power belonging to the state.

Besides these reforms a stringent Corrupt Practices Act was passed, and the Primary Election Law was amended to provide for a second choice in order to secure nominations by a majority.

WANTED: A CHILD TO ADOPT

HENRY H. GODDARD

Director of Research Training School for Backward and Feeble-Minded Children,
Vineland, N. J.

The nineteenth century has been called the age of science or scientific development. It looks as though the twentieth century would be called the age of the application of science. Not that we have not already had many applications of the

natural sciences to the arts; but we are now coming to apply the higher and more abstract sciences to the more difficult art of living.

The writer was recently asked to make an application of scientific facts to the problem of adopting a child. A friend sought advice about answering an advertisement asking for a home for a homeless child. This led to the question, Who are the homeless and neglected children? Why are they homeless? Why should any child be neglected? These questions ought to be satisfactorily answered, and the answer should be taken into account by my friend or by anyone thinking of taking a neglected child into his home.

We may imagine a person ignorant of the facts attempting to answer these questions somewhat as follows: These children are not orphans, else the advertisement would have mentioned the fact; they cannot be the children of well-to-do parents, because such parents would take care of their own; they cannot be children even that have relatives, such as uncles or aunts or grandparents, or even cousins, who are in comfortable circumstances, otherwise the family ties would lead to their taking care of their homeless and neglected relatives. It would seem then that they must be, in many cases, the children of profligate parents, children of families who are unable to maintain their footing in the community, or even provide for the necessities of life. And this is the condition not only of the parents, but also of the other relatives of the family. In other words, these children have no relatives who are sufficiently endowed with self-respect and intelligence to enable them to make a living for themselves, or to have interest enough to care for their own kin.

Now what bearing does this have upon the problems of furnishing homes for the homeless? What effect does it have upon me, supposing that I contemplate taking one of these children into my own household?

If some farmer should offer me a calf on condition that I should raise it and care for it, take it and treat it like one of the herd, I would be considered a very poor and careless farmer if I did not

inquire into the pedigree of that calf, and ascertain as far as possible what the likelihood was that it would be worth raising—whether it had sufficiently good ancestry to give at least a fair prospect of its developing into a good cow. Suppose, further, that I am interested in the welfare and success of dairy stock and that I have in my yard fine breeds of cattle; how much less would I take a calf into that herd whose pedigree I knew nothing about, and breed from that calf and mix in my herd the blood of this unknown. Still further, suppose there was a good reason to believe, indeed every reason to believe, that this calf was of bad stock, mongrel, poor, even diseased. No man that pretends to any knowledge of stock-raising would think for an instant of taking such a calf, raising it, and breeding from it.

Now it happens that some people are interested in the welfare and high development of the human race; but leaving aside those exceptional people, all fathers and mothers are interested in the welfare of their own families. The dearest thing to the parental heart is to have the children marry well and rear a noble family. How short-sighted is it then for such a family to take into its midst a child whose pedigree is absolutely unknown; or, where, if it were partially known, the probabilities are strong that it would show poor and diseased stock, and that if a marriage should take place between that individual and any member of the family the offspring would be degenerates.

Lest any reader should be disturbed through fear that we are preparing to attack the plan of finding homes for the homeless, let me hasten to say that such is not the intent, nor is it the logical or necessary outcome of the argument. But no cause, scientific or humane, ever prospers through ignoring the facts; and in view of the hundreds and thousands of children that are annually placed in good homes and brought up practically as members of the family, and in view of the further fact now coming to be understood that disease and mental deficiency and possibly crime are transmitted from parents to children, grandchildren, and even to the fourth genera-

tion, it is not only wise but humane for us to consider the fact and perhaps revise our practice.

As I write, a bright-looking, well-developed girl of about twenty has passed in front of my window. To the casual observer she is a normal child; but to us who have known her a year or more she is distinctly feeble-minded, with no power of self-control, no consistent plan or ideals of life, and without the protecting walls of the institution she would rapidly degenerate into a criminal or a prostitute.

There hangs on the wall in front of me the family history, the heredity chart of this girl. It includes 319 persons in her family, going back to the fifth generation. Of these 319 persons now known to us, 119 are, or were in life, feeble-minded. This girl has seven half-brothers and sisters, all feeble-minded. Their parents were feeble-minded, the grandparents were feeble-minded, and also two great-grandfathers, and two great-great-grandfathers.

When we began to inquire into the history of the other members of this family our first information said, "a half-brother and sister are placed out in good families." As we read that sentence there comes before our minds a picture. This picture includes what we know of these children, of this half-sister that we know intimately, of the mother whom we know, of the father whose history we know. And then we see these children placed in a good family, growing up perhaps with every comfort, possibly with luxury, being accepted as possibly a little dull, perhaps not good scholars, but otherwise considered normal, because these people with whom they are living are not experts in the detection of mental deficiency.

To assume the most favorable case possible, we will say that perhaps these children are so dull that neither the son nor the daughter of the family will be tempted to fall in love with them. But some person in the community will undoubtedly do so. History shows that these people nearly always marry, and some probably intelligent, respectable young man may fall in love with this girl, feeble-minded as she really is, and

marry her. This slightly defective boy will have no difficulty in finding some girl who will consent to share his life with him, and so there is laid the foundation for another race of mental defectives, perhaps worse than the present. This is no "bogie" that we are creating. Our statistics show that this is the thing that is happening every day in every section of our country. Shall we go on making possible the occurrence of such things?

Let me draw you another picture of actual facts, perhaps not worse than this, but certainly more appealing. I have before me a family chart of a girl normal in intelligence, bright, and attractive. Not even the experts can discover anything wrong with her. She has brothers, and a sister, also normal; altogether, it seems that the feeble-mindedness which is so evident in the mother has for some reason run out and come to an end, and that now we begin with these children a new race. Let us follow the possibilities in this case. As we have said, the mother is feeble-minded, her father was feeble-minded, with several brothers and sisters in like condition. But the mother dies, her family are already gone, and people rejoice that at last the hindrance, the taint in the family, has disappeared, and these children are left without any of it; it remains only to find them homes where they will be cared for until they are old enough to care for themselves, and all will be well. Accordingly, a home is found for this girl, in a well-to-do family with three children of their own, but philanthropically disposed, with ample means, glad to take this nice-looking child into their home and bring her up as one of their children. She grows up as one of the family, except that all know she is not their own child. She comes to young-womanhood, the son of the family falls in love with her, and there being no visible objection to a union, they are married. In due course of time a child is born and then another and another. As the years go by these children grow up and to the horror of all interested it is discovered that one or possibly two, possibly even three of them, are feeble-minded.

When it first becomes evident that the

children are not normal, the older people say, "Ah, well, the grandmother was wrong, the great-grandfather was wrong, it was a bad family." And so the old law so well expressed in holy writ that the condition of the father is visited upon the son to the third and fourth generation still holds and will always hold. In other words, the parents who took this child into their home and later allowed their own son to marry her might have known, had they taken the trouble to inquire, that the probabilities were strong that if children were born to that girl some of them at least would be feeble-minded. The fact that neither she nor any of her brothers and sisters showed mental defect was no evidence whatever that their posterity would be free from it. Indeed, statistics now clearly indicate a high probability that defectives will again appear in that line.

These are facts, and in view of these facts, ought we not to take some thought and care in this matter of finding homes for the homeless and neglected? We are now face to face with the question, "What ought we to do?"

In the first place, we ought to be honest, as I trust we are, although many of us can look back to the time when we were not. The writer knows of at least one institution whose policy used to be to place its girls out in families and conceal from those families the true character of the girls, even when it was known to the institution management. But we trust that that has passed by and that today we do at least acquaint such people with the facts as we know them. But we cannot stop here; we must use every means to learn *all* the facts before we place these children in the care of other unsuspecting fathers or mothers who are willing to take care of them and give them a home.

It means that the family history of every homeless and neglected child must be ascertained just as far as possible, and that no pains or expense be spared to get all the information that can possibly be had. Then the prospective foster-parents should have before them all the information that has been acquired in regard to these children, so that they may

guard not only their own children if they have them but other children from any alliances that are dangerous from a hereditary standpoint. If this results in such families refusing to take these children, then we must provide for them in colonies. Charitable organizations, even the state, can well afford to do this rather than run the risk of contaminating the race by the perpetuation of mental and moral deficiency.

The problem looks large and is large. It looks almost hopeless, but it is not hopeless. The fact that we may not see the solution is no excuse for continuing blindly to do wrong and injustice to thoughtless, well-meaning people, and even to the very homeless and defective child itself.

This is not the place to go further into the question of ways and means. Such can be found, and ought to be used. It is neither right nor wise for us to let our humanity, our pity and sympathy for the poor, homeless, and neglected child, drive us to do injustice to and commit a crime against those yet unborn.

BOOKS FOR SOCIAL WORKERS

LILLIAN BRANDT

Contributing Editor

FIVE BOOKS ON IMMIGRATION

IMMIGRANT RACES IN NORTH AMERICA. By Peter Roberts, Ph. D. Y. M. C. A. Press. New York, 1910. Pp. 109. Price 75 cents. By mail of THE SURVEY 81 cents.

GREEK IMMIGRATION TO THE UNITED STATES. By Henry Pratt Fairchild. Yale University Press. New Haven, 1911. Pp. 278. Price \$2.00 net. By mail of THE SURVEY, \$2.15.

THE ALIEN PROBLEM AND ITS REMEDY. By M. J. Landa. P. S. King & Son. London, 1911. Pp. 317. Price \$1.21. By mail of THE SURVEY, \$1.30.

NATIONALITIES AND SUBJECT RACES. Report of Conference held in Caxton Hall, Westminster, June 28th-30th, 1910. P. S. King & Son. London, 1911. Pp. 178. Price 85 cents. By mail of THE SURVEY 93 cents.

ENGLISH FOR ITALIANS. By Edith Waller. William R. Jenkins Co. New York, 1911. Pp. 297. By mail of THE SURVEY \$1.00.

An influx of foreign peoples into an established community is always a matter of great interest, especially when, as with us, the addi-

tions amount to about one million persons a year. Not only are the numbers great, but the nationalities are so numerous that a new Baedeker is needed for the puzzled citizen to find his way around among Huns, Poles, Slovaks, Letts, Lithuanians, Croatians, and the like.

Such a Baedeker is provided in Peter Roberts's *Immigrant Races in North America*, a little book of about a hundred pages, which attempts to give in the briefest compass the essential facts about our immigrants. The scheme of classification includes forty-one different peoples, thirty-seven of which are those given in the immigration reports. The remaining four are separated from some one or more of the thirty-seven. These peoples are then classified under "groups," which are in the main based on language rather than on race, and which in turn roughly correspond to the greater divisions of the European and Asiatic races. Mr. Roberts proceeds with descriptions under the group headings, twelve in number, giving for each an account of its composition, language, government, religion, and its part in the history of immigration, ending with a brief bibliography.

It is obvious that with so much to include in a limited space the portrait of each group has to be drawn with a few positive strokes, leaving out the delicate play of detail that gives the real physiognomy of a people, and the intensive analysis of its character that would enable intelligent and sympathetic dealing with them. It is not, for example, particularly enlightening to be told that "the Latin peoples are fond of display and in government they love system and bureaucratic form of administration."

The special section given to "government" and the stress laid upon the bare fact of political subjection to another people indicates that this condition is considered of importance in the story of immigration. But as no conclusions are drawn from it, one fails to see why valuable space is taken up with a circumstance which is not in obvious relation to the problem.

Again, the need for brevity is partly to blame for the statement that "the Celts have lost all self-government. The Irish, Scotch, Welsh, and Manx are subject to the British crown"—a saying to cause any Scotsman to raise up his voice in earnest and indignant protest!

The very bracketing of Scotch and Irish together in one "group" is a further example of the handicap of brevity. Because a scheme of classification based on language is used, the Irish, all of whom used to speak Gaelic and most of whom have forgotten it, and the Scotch, one-third of whom used to speak Gaelic while two-thirds are akin to the English both in language and race, are classed together, although in most important particulars, especially those which bear upon their character as immigrants, they are widely apart.

The book is illustrated with portraits of race types, some of which have appeared in

THE SURVEY, and with two interesting maps, one showing the centre of immigration of the different groups to North America, the other the religious faith of the emigrants, by geographical divisions. But from both of these, curiously enough, our great body of Hebrew immigration is missing.

No complaint can be made of lack of detail in the next book on our list which, in contrast to Mr. Roberts's 100 pages devoted to forty-one peoples, gives us 275 pages about one people, the Greeks, who make up only 2 per cent of our total immigration. Dr. Fairchild has apparently gathered all available facts, figures, and opinions on all phases of Greek life, in addition to the results of his own personal investigations, carried on in the home country itself as well as in all parts of the United States where Greeks or Greek colonies were to be found. He has covered, in this task, the physical environment in the home country; the national character, religion, and language; the economic conditions; the causes, sources, and means of emigration; the economic and social conditions of the Greeks in the United States; and, finally, the effects of immigration on the immigrants themselves, on the home country, and on the country of their adoption.

It is interesting to see, in the successive histories of immigration of different peoples, one story repeating itself in its main outlines; it almost seems possible to dispense with any more attempts at proof of tendency, and continue our immigration studies only to satisfy a pleasant curiosity as to minor divergencies of type.

In this story of the Greeks, we have the familiar tale of an agricultural people, stirred by a desire to rise to a higher economic level, making their way to a country of better opportunities. First comes the young able-bodied male laboring force, unmarried or leaving wives and children behind. They are mainly from the country districts, used to hard work, poor, illiterate, but in good health. Arriving in the new country, they are at first, through ignorance, subjected to industrial exploitation at the hands of "padroni" of their own race or otherwise. Wages are low, but the immigrants are thrifty, send money home, and are not found in undue proportion in the dependent or delinquent classes of the new country.

At first they regard the old country as "home." Little by little they learn the ways of the new country, secure greater industrial freedom, send for wives and children, and settle down as permanent citizens of the republic. The second generation shows some unfavorable symptoms, due to the process of change, but gets an education, and on the whole, rises in the social and industrial scale. By the time the third generation is reached we have such good Americans that they are not distinguishable from the native element, and are themselves keen for the exclusion of the "ignorant foreigner."

Interesting illustrations of contrast and sim-

ilarity to our own problem are shown in the next book, *The Alien Problem and Its Remedy*, by M. J. Landa. In this instance the country is England, and the "problem" the Jews.

This book is distinctly a bit of special pleading for the Jewish immigrants to England, written by one of their own faith. He has obviously made the most of all points in their favor, and the least of all the points against them. The book centers about the Aliens Act of 1905, giving an account of the agitation leading up to it, and discussing the methods of operation and the effects of the act itself.

The similarity with our problem lies in the general attitude of fear and hostility of the native toward the foreigner and in the actual advancement of the foreigner himself, belying these gloomy anticipations. Notwithstanding the one-sided view of the author, the facts he adduces seem to set forth the same story told in the history of immigration to the United States—only in more positive terms—that the foreigner finds a normal place in industry, that depression of wages and overcrowding are not primarily attributable to him, that he is not a pauper, not a criminal, that ignorance is soon overcome, and that comparative prosperity soon follow immigration.

In contrast with most other immigrants, the Jews, in the United States as in England, are city dwellers, accustomed to working at trades and not at agriculture. They naturally tend to settle in cities, but are less liable to the ills of city life than the peasant immigrants from Italy and Austria. This we are familiar with, but the points of contrast between conditions surrounding the same people in the two countries are novel and interesting when looked at in detail.

In the first place, note the difference in the extent of the problem. The United States, with a population of 90,000,000, receives about 1,000,000 immigrants a year, of whom perhaps 100,000 are Hebrews; Great Britain, with 42,000,000 people, welcomes annually only about 28,000 immigrants, nearly all of whom are Hebrews. This is the estimated net immigration of Hebrews, for a large proportion of the actual Hebrew arrivals are *en route* for the United States.

Of these immigrants, practically all settle in one district of London, which consequently has to take the consequences that would arise were a twenty-fold immigration distributed even as widely as in the United States, where there is the same tendency on the part of the Hebrews to congregate in cities. Another contrast is found in the different relative position of the immigrant to the native working population of the country to which he has come. The Jewish immigrant, whose standard of living on first arrival is obviously lower than that of the native laborer or of the earlier immigrant in the United States, and who has to be pleaded for on the ground of his potentialities for improvement, shows to absolute and immediate advantage in

comparison with the native British workman, whose wage scale is low, whose crime rate is high, and whose dependence on charitable aid has become a fixed habit.

On the administrative side, it is interesting to watch the English government struggling with an unaccustomed kind of law. The Aliens Act was the first attempt at any systematic exclusion of incoming peoples, and there were no practical precedents to follow in working out the detail of the act and its administration. Space forbids a transcript of even a few of the many strange complications that ensued from the enforcement of the act. One circumstance only may be mentioned: that there is no immigration station on shore where immigrants may be landed for examination. They must be examined on board the ship itself and detained there, if further inquiry is deemed necessary, until such inquiries are answered satisfactorily. The abuses such a system gives rise to are obvious. The detained immigrants are the unwelcome guests of the ships and liable to all sorts of abuse, including robbery and bodily violence. And finally, if inquiries are not answered satisfactorily by the time the ship is ready to sail on the return voyage, the immigrant has to go back with it.

Were one-half the things done in the Port of New York that are described by Mr. Landa as occurring in the Port of London the result would be riot and revolution. Furthermore, we should consider a law applying only to steerage passengers and to vessels carrying twenty passengers and over about as effective as trying to dip up water with a sieve, and hardly worth enforcing at all.

Another way in which different races come into relation is by colonization, when, instead of the weaker people coming to the country of the stronger, to prosper by rendering service to their new land, a stronger people goes to the country of a weaker race, to gain prosperity through command of the latter. The problem is the same at bottom, except that in the case of colonization the claim of the weaker is more distinct and the right of the stronger less justifiable.

This aspect of the problem is the one taken up in the report of the Conference on Nationalities and Subject Races, held in London June 28-30, 1910. This is not the so-called Races Congress held in London every year at about the same time, but had its origin in a committee formed at an international conference held at The Hague in 1907. It was called the Subject Races International Committee, and consisted of representatives of seven constituent societies, one of which was the Friends of Russian Freedom so well known in this country.

This conference took up in two sessions the cases of Egypt, India, Morocco, Finland, Persia, and Georgia. The third session was given over to Ireland and Poland; the fourth considered forced labor in its different forms of peonage, indenture, and slavery, and the

black race in general; and the fifth meeting was devoted to the discussion of remedies.

It is interesting to note, on glancing over the papers, that the subject races were pretty well divided between Great Britain, at one end of the scale of freedom and civilization, as we are accustomed to think, and Russia at the other. And the complaint of exploitation and oppression as voiced in the protests made was as bitter against the one as against the other. In fact, the parallel was definitely drawn; the claim was openly made that the worst horrors of Russian oppression could be paralleled under the British rule in India.

It would be unjust, however, to base definite conclusions on the contents of this volume; for the addresses are most of them not only made from an extreme partisan standpoint, but are so lacking in particularity as to give no adequate ground for judgment. Many of them indeed are no more than expressions, perhaps one would better say explosions, of resentment, injured pride, and the like. But some contain really valuable information, as, for instance, Sir Charles Dilke's paper on Forced and Indentured Labor, referring to labor conditions in South America. The entire report is well worth looking through, to give at least suggestions of other possibilities of fact and principle than those afforded by imperialism.

Last on this list of books dealing with the foreigner in some aspect is a set of lessons called *English for Italians*, by Edith Waller. Although the book is planned primarily for Italians, the method and material may easily be adapted to the use of foreigners of other nationalities. It is intended for adult pupils, and the aim has been to make it practical and interesting as well as simple, and to hold the interest of the pupils by variety of form and subject matter. A glance over the 114 lessons shows an early introduction of practical words and topics; but, although the present reviewer has of course no means of testing the actual efficiency in use of this book, the criticism comes to mind that there is perhaps a little too much grammatical instruction for the untrained student to grasp while trying to master a new vocabulary, and that the vocabulary itself might be made a little more directly practical at the beginning than it is.

KATE HOLLADAY CLAGHORN.

HOSPITAL. MANAGEMENT. By Charlotte A. Aikens. Philadelphia, 1911. W. B. Saunders Company. Price \$3.00. By mail of THE SURVEY, \$3.24.

The method chosen by the editor for the compilation of this very useful volume is exceedingly effective. The book consists of a series of articles, called chapters, each by a different author. The writers chosen are people of well known ability. Many of them will be recognized as at the head of their respective professions. Each chapter, except the first and the fifth, deals with a clear-cut, well-defined department of the subject and

each part is treated in a very practical manner.

The result is an able presentation of the whole subject which will be of particular value to boards of trustees, and to non-medical superintendents of large institutions which include a hospital department among their activities; while to the superintendent of a hospital, especially a new one—where the superintendent is also comparatively new—the volume is simply inestimable.

The first chapter is by Dr. Charles P. Emerson, which is equivalent to saying that it is readable as well as wise and practical. Its title is the *Hospital Field* and it gives some historical data as well as a resumé of the whole subject of hospitals and their management. It is of course much more general in its range than any of the other chapters.

Chapter five on a *General Hospital for One Hundred Patients* is by a hospital architect and an experienced superintendent in collaboration. It goes into the details of construction and general equipment in a complete and exhaustive manner. Plans of buildings are shown.

It seems invidious to single out chapters for special commendation when all are so good, but those on the *Board of Trustees and Their Responsibility*, the *Dietitian's Province and its Management*, and the *Annual Report* seem to deserve special comment.

The only serious defect is the omission of a chapter on *Hospital Social Service*. That important subject is treated in fifteen lines and the writer seems to think it includes nothing but material relief on the one hand, and the avoidance of pauperization, which might come from treating people without charge when they are able to pay, on the other. Some slight amends for this neglect are made in a fairly good bibliography on the subject, printed on the opposite page; and Dr. Emerson, in the opening chapter, devotes one full page to the same topic. When a second edition shall be called for, it would certainly be well to ask Dr. Emerson or Dr. Cabot or Ida Cannon to write a chapter on *Hospital Social Service*.

ALEXANDER JOHNSON.

YOUNG GAOL-BIRDS. By Charles E. B. Russell. Macmillan Company. New York, 1910. 236 pp. \$1.10 net. By mail of THE SURVEY \$1.20.

This book gives well-chosen life-stories of fourteen English boys, from fifteen to twenty-five years of age, with their environment in the Manchester slums tellingly sketched. It is frank and without sentimentality. Several were hopeless cases; only a few were rescued from the round of unemployment, followed by short jail sentences imposed alike for sleeping out or crime. Each is a convincing appeal for probation or an indeterminate sentence in a reformatory.

T. D. E.

THE STANDARD OF LIVING AMONG THE INDUSTRIAL PEOPLE OF AMERICA. Hart, Schaffner, and Marx Prize Essay. Houghton Mifflin Co. Boston, 1911. 196 pages. Price \$1.00 net. By mail of THE SURVEY \$1.10.

Frank Hatch Streightoff's essay on the Standard of Living Among the Industrial People of America is a study of the various original investigations that have so far been made along this line. Among these the eighteenth annual report of the United States Commissioner of Labor (1901) inevitably occupies the most prominent position as being by far the most extensive study of the kind ever yet undertaken in the United States, and the only one which attempts to set forth conditions in the country as a whole; but the high value of Dr. Chapin's more recent and more intensive investigation of the Standard of Living in New York city (1909) is duly recognized, and other local studies are largely drawn upon.

The first four chapters consider the amount and sources of income, the distribution of expenditures, and the extent of unemployment among the classes included in the title, some striking estimates being quoted on the latter topic, and the subject of children and women in industry being briefly but effectively touched upon. There follow chapters on housing, food, and clothing, and the moral, psychological, and social, as well as the physical effects of too low a standard are dwelt upon. In the chapter on Thrift (which, by the way, is inserted in such a way as to interrupt the natural sequence between those which precede and follow it), there occurs an interesting discussion of the relative value and availability to the poor of savings banks, building and loan associations, and life insurance. The inferior purchasing power of the "poor man's dollar" as compared with the "rich man's dollar" is tellingly illustrated, while the entire study impresses the never trite lesson of the inestimably greater personal cost at which it is earned. Even though some attempt be made to calculate the loss to the community of the productiveness wasted by unemployment, or of the shortening of the industrial life of toilers by the physical and nervous strain of over-work, how shall any statistician measure the value of the vitality lost by lack of proper ventilation, warmth, nourishment, and medical attention, or the cost in morality and self-respect of bringing up a family in a degrading environment, or of the theory that it is "cheaper to move than to pay rent"?

After estimating the living wage for the country at large, with no allowance for savings and but little for recreation, as from \$600 to \$650 a year, and pointing out that at least five million workmen are receiving less than this wage for their labor, Mr. Streightoff devotes his concluding chapter to brief mention of a few of the more important suggestions in the direction of amelioration (omitting any allusion to the program of Socialism).

The bibliography is interesting, and gains in value from the care with which, after the rather elaborate classification necessitated by the breadth of the subject, the number of titles has been kept within bounds.

Mr. Streightoff has permitted himself but little original expression in the present essay, and it seems probable that some further direct research would increase his power of discrimination among the authorities from whom he quotes. There are occasional rather startling misstatements—for example, that on p. 130, "It is probable that at any given time more than half the tenement-house dwellers in New York city have tuberculosis"!—and the diction is not above criticism. On the whole, the book is an earnest and valuable study in a difficult field.

CAROLINE GOODYEAR.

THE TREND OF THINGS

The Library of the New York School of Philanthropy began on October 1 the regular publication of bibliographical bulletins on social subjects. The first bulletin, on Farm Colonies for Vagrants, contains a list of the best books and periodical articles on this subject, carefully selected and annotated. As the act for establishing a farm colony in New York has but recently been passed, the bibliography is most timely. Nor will it be of interest only in this state, for the problem is country-wide and other states are advocating such farms or have already established them. The library hopes to make the bulletin of real service to social workers, and suggestions for increasing its usefulness will be appreciated. The next bulletin will be on Vocational Guidance. Readers of THE SURVEY may have the bibliographies free every month by sending a request to the Library of the New York School of Philanthropy, 105 East 22d street, New York city.

* * *

The first report of the New York-New Jersey committee of the North American Civic League for Immigrants, which was organized in December, 1909, to carry on the plan of work outlined by the State Immigration Commission, covers a period of fifteen months.

The work of the committee has been along the lines of strengthening, unifying, and standardizing work already begun, developing new agencies, securing the passage of new laws, and studying conditions in various centers of immigration. Along the last line work has been begun in Rochester, and at the time that this report was issued arrangements had been made to begin studies in Buffalo and Brooklyn within the month.

For the protection of the immigrant on landing an immigrant guide and transfer service has been established at Ellis Island, police protection at this place has been increased threefold, and other means adopted for pre-

venting exploitation. Transportation of immigrants on lines going out of New York has been investigated and some abuses remedied. An attempt has been made to do away with fraudulent practices of notaries public, and the trial and removal from office of sixty-four of them has had a most salutary effect. A like attempt to prevent the charging of fraudulent fees by lawyers in deportation cases is already yielding results. The bringing together for purposes of enforcement, repeal, or amendment of the state laws affecting immigrants has been begun, and a broad and fruitful program of education of both adults and children has been planned, and on a small scale has been put in practice.

The offices of the committee are at 127 Madison avenue, New York.

* * *

"Why is it that, with a steady increase in the prosperity of most classes in the community, there has been no corresponding improvement in the position of the lower classes of labor?" This question is asked editorially in the September issue of the *Charity Organisation Review*, London, England. The answer given is as follows:

"We are tempted to reply that the C. O. S. will once more prove to have been right in its persistent teaching that you cannot improve the position of the wage-earners by subsidising wages; and that school feeding, distress committees, old age pensions, and *id genus omne* have had their natural and inevitable effect in depressing the wage-earning power and wages of the class which benefits by them. No doubt there are other considerations to be taken into account, but no interpretation of the facts would be complete without this one."

Another editorial in the same journal declares:

"For some time now pauperism in London has shown a marked tendency to rise, after the great diminution caused by the removal of the pauper disqualification under the Old Age Pensions Act. The figures vary a good deal from week to week, but the rate per 1000, which on June 17 was 22.3, and on July 15 22.4, had reached 22.8 on August 12. This represented an increase on the previous week of 1257 paupers, of whom 690 were indoor and 567 outdoor. On August 19 there was another rise to 22.9."

* * *

The *Exploitation of Pleasure*, by Michael M. Davis, Jr., published as a pamphlet (10 cents) by the Department of Child Hygiene of the Russell Sage Foundation, comprises in full the report first made by Mr. Davis for the New York Child Welfare Exhibit. It gives a compact review of the problem of commercial recreations in New York. Mr. Davis has pointed out how modern industry and the modern city have created home conditions which, for the mass of the people, are too crowded to permit recreation and enjoyable leisure within the home. He shows, in consequence, how the spontaneous and normal demand for recreation, because of

the utterly inadequate facilities provided by municipality and private philanthropy, finds expression in the patronage of those opportunities which commercial enterprise has so abundantly and ingeniously provided. He believes that a thoroughly democratic recreation policy should include legal regulation enforcing a minimum standard, and constructive action for increasing opportunities for recreation of a desirable sort.

For practical policies he suggests enforcing a standard of purity in candy, regulating dance halls and academies, teaching dancing in the public schools, extending the use of school buildings, providing meeting-rooms as a commercial venture in combination with dance halls or moving-picture shows. In regard to the theater he writes: "Offer in the standard theaters more plays, especially for children, and make these widely accessible; apply brains to vaudeville; improve the license and building laws; provide means for enforcing existing laws against immoral productions; utilize the recreative and educational possibilities of the motion picture; connect the educational system with the drama by dramatic presentations in the schools and by a positive censorship of the commercial theaters."

These conclusions as well as the spirit of the study will emphasize the reader's realization that the democratic solution, the only solution of such a problem as that of recreation in cities, must be through the large and impersonal processes of legislation and public enactment. However great the services of private agencies in standardizing or in providing recreational opportunities, they reach a pathetically small proportion of the people.

COMMUNICATIONS

GOOD SAMARITAN DOWN TO DATE

TO THE EDITOR:

The Good Samaritan has cared for the half-dead traveller on the Jericho road. And now what shall he do? For the Jericho road still exists and men are still travelling it.

In the parable the Master illustrates the meaning and duty of neighborliness and he makes it very plain that loving helpfulness is the essence of all religion and is more than burnt-offerings and orthodox professions. And now what shall the Good Samaritan do in view of the fact that there is a Jericho road and that many people travel that way?

Yesterday he built a hospital along that road and equipped it with trained nurses to care for all wounded travellers. It is a very beautiful and Christian work; but, alas, the supply of wounded travellers seems ever to increase. This the Good Samaritan did yesterday.

What is the Good Samaritan doing today? Today he is going up to Jerusalem and is calling upon the Jerusalem police to break up the nest of robbers that are waylaying and wounding travellers. It is no doubt a very

necessary and proper work; for the ruler is the deacon of God unto men for good; he is an avenger for wrath on them that do evil. But, alas, he finds that there is an ever new supply of robbers to waylay and hurt travelers.

What will the Good Samaritan do tomorrow? Tomorrow he will call a few of his friends together and will ask them some pointed questions. How did it come about, my brothers, that Jewish boys became thugs and cut-purses? Are we in any way to blame? Have we neglected these boys and permitted them to become highway robbers? Come, my brothers, let us see to it that in the future no boys in our neighborhood shall be permitted to become highway robbers. This the Good Samaritan will be doing tomorrow; and in so doing he will prove himself a neighbor indeed to all men and will show that he is a wise worker in society.

DOUBTS END OF TUBERCULOSIS

TO THE EDITOR:

Your issue of August 19 contains an article by Christopher Easton entitled the End of Tuberculosis. The author will no doubt pardon those who decline to subscribe to his Utopian plan. It is not difficult to outline an ideal scheme and with that as a basis to build an argument which has the appearance of being logical. It seems to the writer that in future the discussion of this problem should be conducted upon a basis of fact. Millions of dollars have been expended. Sanatoria have been multiplied. Enlarged powers have been given to boards of health. Yet today we are almost ready to ask whether the results justify the expenditure.

The reason is not far to seek. Ideally extravagant unattainable results were promised which could not be realized. In order to hit the mark one must "aim a little above it"; but to shoot wide of the mark is evidence of poor marksmanship or of an idealistic enthusiasm which ignores basic conditions.

The so-called war upon tuberculosis has been conducted upon the assumption that if those already infected can be prevented from infecting others no more cases would develop. That habits of cleanliness aid in the suppression of disease and tend to the preservation of health is axiomatic; but that tubercular disease can be ended by such means alone or even made a negligible quantity by segregation or corporate control is but a delusive dream. It may be granted that without tubercle bacilli there can be no tuberculosis. Yet we do not know whence tubercle bacilli come nor by what avenue they gain entrance to the human body. Whether they enter by inhalation or by way of the stomach and bowels or by some means yet undetermined is a problem which awaits solution.

The philanthropic efforts of laymen have done much to prevent disease by improving the environment in which people live and by

educating them in the art of living in a healthful manner. The average individual, however, fails to realize that the general health is undermined, the physiological powers of resistance lowered, and the door thrown wide open to infection by many of the habits which obtain in daily life. Among these are overeating, worry, indigestible food, drinking, use of tobacco, sexual excesses, anger, loss of sleep, poor ventilation, exposure, the habit of taking unnecessary risks, and insufficient food. Indeed, if we exclude acute disease, the conclusion is irresistible that many of the ills of man are the direct result of his own ignorance, careless recklessness, scorn of self-control, and of his determination to have what he calls a good time at all hazards. Our hospitals, sanatoria, insane asylums, and jails all bear mute but eloquent witness to the truth that "whatsoever a man soweth that shall he also reap."

The bearing of all this upon the tuberculosis problem is evident when we remember that it is a disease incident to physical degeneration, that individuals whose powers of resistance are normal are immune. The measures already taken to care for the sick and to afford some degree of protection to the public were necessary, helpful, and possibly as successful as can reasonably be expected; but at best it has been an effort to control the manifestation of a degenerative process.

Until the problem is approached with a clear understanding that the bacilli are present because of a breach in the human wall, and that we are playing a losing game until the breach is closed, we can not expect to control, much less end, tuberculosis. "The physical improvement of the race and the conservation of the physiological forces of the individual" should be the war-cry. The surgeon wastes no time fighting bacilli beyond enforcing a proper sanitary environment. He closes the wound and keeps the bacilli out.

There is a large field for the teaching of sanitary science in the home and the inculcation of self-control. The activity along these lines should be persistent and aggressive and the result will be far more effectual in preventing tubercular disease than millions spent in segregation camps under corporate control.

JOTTINGS

Roosevelt on Womanhood.—Under the joint auspices of the Civic Forum and the Metropolitan Child Labor Committee a meeting will be held at Carnegie Hall, Friday evening, October 20, at which ex-president Theodore Roosevelt will give an address on The Conservation of Womanhood and Childhood. The Metropolitan Child Labor Committee is an auxiliary of the New York Child Labor Committee. It is announced that Mr. Roosevelt, to whom an invitation to make this address was extended immediately after his African trip, will make no other public engagements for an indefinite time.

THE SURVEY

SOCIAL CHARITABLE CIVIC

By Mayer in the New York Times.

DR. WILEY AND HIS CRITICS.

The Human Roulette Wheel is a Coney Island institution—a revolving disk which hurls in all directions those who try to sit upon it. Mr. Mayer made use of it in what is perhaps the cleverest cartoon of the present phase of the agitation for pure food and pure drugs.

William Jay Schieffelin, who as a manufacturing chemist of national standing is a unique and strong figure in the campaign, puts some of the vigor he has shown as a civic reformer in New York into a plea in this issue of THE SURVEY for a National Department of Health. The Wiley case is his text.

THIS ISSUE TEN CENTS A COPY :: TWO DOLLARS A YEAR

105 EAST 22D ST., NEW YORK

31 WEST LAKE STREET, CHICAGO

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply. *Continued on next page.*

Child Labor

National Child Labor Committee, 105 East 22d St., New York. Owen K. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

Children

National Conference on the Education of Dependent, Backward, Truant, and Delinquent Children. Conference reports \$1 each, including membership in conference. Address Elmer L. Coffeen, Sec'y and Treas., Westboro, Mass.

National Health

Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York.

To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

School Hygiene

American School Hygiene Association. Pres., David L. Edsall, M. D., Washington University; Sec'y., Thomas A. Storey, M. D., College of the City of New York, New York.

Yearly congresses and proceedings.

Working Women

National Women's Trade Union League, 127 N. Dearborn St., Chicago. Mrs. Raymond Robins, President.

Information gladly given. Official publication, *Life and Labor*, three months' subscription, 25c.

Prison Labor

National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stag Whitin, Ph.D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

The Church and Social Service

The Federal Council of the Churches of Christ in America operates through its Commission on the Church and Social Service.

For literature and service address the Secretary, Rev. Charles S. Macfarland, 215 Fourth Avenue (at 18th St.), New York.

Municipal Problems

National Municipal League, 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

Child Helping

Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York.

Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

Recreation

Dept. of Child Hygiene of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. Lee F. Hamner, Associate Director, Division of Recreation.

Research and the promotion of activities favorable to the physical and social welfare of young people.

Tuberculosis

National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M. D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual Transactions and other publications free to members.

Conservation of Vision

American Association for the Conservation of Vision, 25 West 39 St., New York. Ida B. Hiltz, Sec'y. To prevent blindness and impairment of vision from diseases, defects, accidents and abuse. Literature and exhibits. Ten state organizations. Membership \$1. Charter \$5.

Women in Industry

National Consumers' League, 105 East 22d St., New York. Mrs. Florence Kelley, Sec'y. Annual Report and other literature free.

Minimum wage boards, protection of women workers, pure food, sweatshops, etc.

Delinquents and Prison Reform

National Prisoners' Aid Society, 135 East 15th St., New York City. O. F. Lewis, Sec'y. Membership, \$1 annually, including monthly sixteen page magazine *The Review*, a digest of the field of delinquency. Parole, prisons, probation, vagrancy, farm colonies, prison labor, etc.

Studies in Social Christianity

October: Accidents and Dangerous Occupations.

November: Sanitation and Hygiene. See the lessons for classes and individuals in *The Gospel of the Kingdom*, published monthly by the American Institute of Social Service, 82 Bible House, New York city. Price 50c. per year. Social information supplied free.

Civic Improvement

AMERICAN CIVIC ASSOCIATION, Union Trust Building, Washington, D. C. J. Horace McFarland, Pres.; Richard B. Watrous, Sec'y. Parks; Recreation Centers; Billboard, Smoke and Fly Nuisances; Preservation of Scenic Wonders.

Playgrounds

Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y.

Play, playgrounds, public recreation. Monthly magazine, *The Playground*, \$2 a year.

Probation

National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y.

Advice and information; literature; directory of probation officers; annual conference. Membership, 50 cents a year.

Sex Hygiene

American Society of Sanitary and Moral Prophylaxis, 29-33 W. 42d St., New York. H. P. DeForest, Sec'y. 18 affiliated societies.

Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

American Red Cross

WASHINGTON, D. C.

William H. Taft, President. National relief organization for great calamities; \$5,000,000 relief in last six years. First Aid Department. Full information on request. Annual Membership \$1.

Labor Legislation

Workmen's Compensation; Industrial Hygiene; Labor Laws.

Official publication: *American Labor Legislation Review*, sent free to members.

American Association for Labor Legislation, Metropolitan Tower, New York City. John B. Andrews, Secretary.

Remedial Loans

National Federation of Remedial Loan Associations, 105 E. 22d St., N. Y. Arthur H. Ham.

Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

SOCIAL FORCES

BY THE EDITOR

THE FAMILY: THE PREVENTION OF DESTITUTION

Two books¹ bearing respectively the above titles, the first by Helen Bosanquet, the second by Sidney and Beatrice Webb, have appeared in England with an interval of five years between the dates of their publication. We trust that notwithstanding this interval and the apparent difference in their titles it will not seem fantastic to consider them together. After all five years is not a long time in the history of so ancient an institution as that of the family; and even the most confident of optimists, like the Webbs and *THE SURVEY*, must admit that five years may prove to be but as a day also in the series of campaigns which the abolition of poverty will require. Written from opposite points of view, the two books admirably supplement each other and serve as mutual correctives in the interpretation of the present English attitude towards social questions. The contrasts between them are perhaps the more striking and suggestive because the first was written before certain of the current issues which absorb the attention of the authors of the second had become acute.

Mrs. Bosanquet stands before her chosen subject in an attitude of acknowledged uncertainty and bewilderment. Modesty and reverence are the keynotes of her discussion. The baffling magnitude of the theme suggests to her that it is perhaps one more fit for a poet than for a sober prose writer. She takes comfort in the reflection that inadequacy after all need not mean failure, acknowledging that she has had nothing new to offer, but has merely called attention to a great fact which lies within the experience of every one. Very different is the attitude of the vigorous critics of the Poor Law in the campaign which they are waging for the prevention of destitution. There are people who would be glad to be as sure of anything as Mr. and Mrs. Webb appear to be about everything within the wide range of their discussion. They have a definite program and they leave us in no doubt as to what it is. Their confidence is superb; their courage equal to their confidence. They sweep to their conclusions with irresistible logic and with a thoroughness of preparation which would be exceedingly dangerous for any adversary who might rashly challenge either their facts or their reasoning. Every social worker may read and ponder with advantage Mrs. Bosanquet's subtle and sound analysis of the psychology of family life, which is preceded by a rapid sketch of the history of the family from the patriarchal and prehistoric type to that of the modern western world. She insists upon the unique place of the child in the family, where, even after he has become an ex-baby, he is still "never just one amongst the others as he is at school for the purposes of the teacher or in still later life as he is one amongst the others for the purposes of the census enumerator and tax collector." She has evidently no sympathy with the view of the "eminent writer" who declared that "schools are designed to curb and replace the evil influences of home." Realizing that the family may in individual instances fail to perform its natural function, Mrs. Bosanquet

¹*THE FAMILY*. By Helen Bosanquet. The Macmillan Company. London. 1906. Pp. 344. Price \$2.75. By mail of *THE SURVEY* \$2.90.

still holds that the "modern family is in no sense a weakened or degenerate form." Enfeebled phases have heretofore proved temporary and it may be hoped that they will again prove so. "Always the family has reasserted itself, at least in the next generation, and always it has proved itself the means of restored independence and prosperity."

In these last words we have the clearest statement of the idea which is set forth in the first of the books under review and tacitly if not openly repudiated in the second. Not that our militant reformers have any quarrel with the family as such; only they do not think of it as a means of restoring independence and prosperity. It is as a benevolent friend of the family that the authors of the *Prevention of Destitution* would calmly transfer many of its functions to the state or to the municipality. Sickness, child neglect, sweating, and unemployment are the particular causes of destitution with which they deal at length, and each of these is to be met by increased or reorganized state activity. As to sickness, for example, the authors, in their own italics, declare that "we ought to make, in each district, the directly elected local Health Authority . . . *definitely responsible for the prevention of sickness of every kind.*" The authors are emphasizing here the disadvantages and absurdity of the existing division of responsibility among various public agencies. Still, the authors will not charge us with misrepresentation in describing their remedies as inspired by a strong faith in the power of the state, operating through central and local organs, to prevent destitution by adopting radical and well devised policies to that end, and following up those policies with energy and intelligence.

Voluntary agencies are to be admitted to a participation in the task of relief and reform, but the responsibility is to rest neither upon them nor upon the family, but upon the state. The moral factor is by no means ignored in the program which is set before us, but it figures as an effect rather than as a cause. The policies advocated—control of disease, compulsory minimum of child nurture, minimum standard wage contract, industrial training of the unemployed with support for the family—are to have a beneficial effect on moral character as well as upon health and physical comfort.

The end which the reformers seek is not physical comfort for its own sake but strength, physical and moral. The policies which they advocate are not in the view of the authors paternalistic but democratic and scientific. The administration upon which they would rely to accomplish the work in hand would not be a bureaucracy, but a social service controlled by an aroused public opinion, developing professional standards and a fine esprit de corps.

We recommend the reading of *The Prevention of Destitution* quite as cordially as we have recommended the reading of *The Family*—not because there is any especial advantage in importing the current controversy over the reform of the English Poor Law, but because America also has her pressing social problems, different in intensity and in kind from those of England, but calling not only for the clear sighted, detached, and long range view of which Mrs. Bosanquet gives us so admirable an illustration; but also for the close range expert scrutiny, the mastery of detail, the uncompromising readiness to act promptly and vigorously when the case is made up, the courage of one's convictions, which have perhaps never been more completely exhibited than in Mr. and Mrs. Webb's campaign against destitution.

THE COMMON WELFARE

A WASHINGTON "YES" TO NEW YORK'S "NO"

The Supreme Court of a second state of the union has declared itself on the constitutionality of workmen's compensation. This decision was given by the highest bench of Washington on September 27, and is favorable. It is the result of a test case brought by a supply house against the state auditor to secure payment for a table furnished the Industrial Insurance Department. Judge Fullerton, who writes the opinion, states that in spite of their dissimilarity in form the principles embodied in the New York and the Washington acts are similar. He offers no direct criticism of the adverse decision rendered by the New York court last winter, but says that

notwithstanding the decision comes from the highest court of the first state of the union and is supported by a most persuasive argument, we have not been able to yield our consent to the views there taken.

The four grounds on which the constitutionality of the act was challenged were that it violates the constitutional provisions that no person shall be deprived of life, liberty, or property without due process of law; that no law shall be passed granting to any individual or class rights not belonging to all; that no individual shall be deprived of the right of jury trial and that all taxation shall be equal and uniform and based upon the money value of property. With the exception of this last objection, the arguments brought in the Washington case would apply to compulsory compensation equally with compulsory insurance. The first of these four considerations was, it will be remembered, the basis of the decision against the New York law. To offset the decision of the New York court the Washington court finds and quotes from

many statutes held constitutional by the courts where liability is created without fault and where the property of one person is taken to pay the obligations of another, with no compensation to the person whose property is thus taken.

Among these may be cited the Oklahoma Banking Law (Noble State Bank *vs.* Haskell) and the tax against owners of saloons to recompense for losses of property due to intoxication (Delfel *vs.* Hanson, 2 Wash. 194). The justification for such legislation Judge Fullerton finds in the police power, which he defines as the "power to govern," and he believes that the clause of the constitution quoted against the law cannot hold good against any regulation by this governing power which is reasonable and not arbitrary or capricious. The statute in question has to his mind this attribute of reasonableness—a reasonableness, it will be remembered, acknowledged by the New York court to be grounded on sound economic and moral principles—and should, he holds, therefore stand.

The police power also, the court holds, covers the second objection that the statute embodies class legislation. The limitations imposed on this power, says Judge Fullerton's opinion, allow of a wide discretion in this respect, one of its distinctive functions being to protect the community at large from certain businesses, for instance that of the rag-man, or to protect the workers in a business from the dangers inherent therein, by such regulations as the fixing of hours and the prescribing of safety regulations. Going further, he holds that the assigning of the funds collected for a definite class of workmen is entirely in conformity with many state and federal precedents held constitutional by the courts, such as the federal law that shipowners must contribute to a fund for a hospital for seamen, or the Kentucky law establishing a license fund for dogs, to be used to compensate sheep owners for the loss of their sheep.

With the same argument of the police power the third contention is met, the court holding that the employe may be obligated to accept the conditions of the statute even when they involve the withdrawal of the right of jury trial. Judge Fullerton acknowledges that there is no

direct judicial authority for this contention but holds that as the state may make it a condition of employment that a man may not be allowed to work more than ten hours a day, so it may force the acceptance of a fixed indemnity for accident as a condition of employment in a certain industry.

The final objection, that the insurance premium provided for by the Washington law is a tax and violates the constitutional provision that taxation shall be equal and uniform, the court meets by the argument that the imposition is not a tax in the ordinary sense of the word as no accession to the public revenue is authorized or aimed at. The fund is to be used not to meet the current expenses of government but to recompense employes for injuries sustained at work. It is in reality, the court holds, not a tax but a license fee, and the decision cites many federal and state decisions on analogous license laws to sustain its holding that such a fee is not inimical to either state or federal constitutions.

The Washington decision is unanimous, though Judge Chadwick in his concurring opinion feels that question of the right of jury trial should not have been decided in the abstract, but left to such time as some employer aggrieved at the operation of the law or some injured workman deprived of his right of jury trial brings a case which could pass for final hearing, on the federal questions involved, to the Supreme Court of the United States. With the conclusions of the court on the other three propositions Justice Chadwick agrees.

The brief for the Washington statute was prepared by George A. Lee and Harold Preston, of Seattle, attorney for the state liability commission which framed the law.

PAROLE ADVOCATED BY THE ATTORNEY GENERAL

Attorney General Wickersham was one of the chief speakers on the program of the American Prison Association in session this week in Omaha. Mr. Wickersham has been gathering statistics from the federal parole boards with

a view to making this an occasion for interpreting their significance and methods to the public. The chief prosecuting officer of the government is a thorough advocate of parole, and the experience under the federal law to date has been of a sort to sustain that position. Out of 207 federal prisoners paroled during the year ended June 30, 1911, but one has been returned to prison for violation of his parole.

The federal parole law was passed in 1910, and creates for each federal prison a parole board consisting of the superintendent of prisons of the Department of Justice, and of the warden and physician of such prison. The resolutions of the International Prison Congress last year endorsed a parole board made up of "at least one representative of the magistracy, at least one of the prison administration, and at least one of medical science." In Mr. Wickersham's opinion it is unwise to include prison officials as members of such a board, as it tends to disturb the relations between them and their prisoners. The provision of the statute that as a condition precedent to the granting of parole the prisoner's first friend must agree to employ or secure employment for him, and to report any lapse in conduct by the prisoner, the attorney general feels affords a powerful leverage to bring to the assistance of the prisoner while incarcerated all the influence and friendships which are usually denied him at the expiration of his sentence. The following facts epitomise the work reviewed by the attorney general:

On June 30, 1911, the federal parole boards had considered applications of 674 eligible prisoners. Paroles were recommended in 234 cases, and all but twenty-seven of these were approved by the attorney-general. Paroles were refused in 440 cases. Four prisoners refused paroles granted to them. Though this is the record of an incomplete year—for the system was not put into effective operation until the fall of 1910—reports made by paroled prisoners show that the aggregate sum of their earnings during that portion of the year remaining after their respective discharges was \$21,881.40.

Of the paroled prisoners, twenty-three were convicted of stealing from the United States mail; twenty-two of violations of the internal revenue laws; sixteen of counterfeiting; six for passing counterfeit money and one for

LOOKING DOWN THE NEW YORK BUDGET EXHIBIT.
Part of the display of the Board of Education.

having possession of counterfeit money; fifteen of embezzlement of National Bank funds; twelve of violations of national banking laws; ten for using the mails for fraudulent purposes; eight of manslaughter; four for embezzling money-order funds and four of larceny; three for each of the offenses of violation of the postal laws, obtaining money under false pretenses, defrauding the United States customs, selling liquor without a license, assault, and robbery; two for each of the offenses of bigamy, forgery, illicit distilling, and photographing United States money; and one each for each of the offenses of breaking into a post office, impersonating a United States officer, resisting arrest, wrongful conversion of post office funds, selling liquor to Indians, introducing liquor into the Indian Territory, rape, kidnapping, and mutilating United States coin.

MUSEUM, CIRCUS, AND SCHOOLROOM IN ONE

Profiting by the experience gained last year, the city of New York is again trying by a graphic budget exhibit to satisfy the curiosity of citizens to know just what Father Knickerbocker gives to them in exchange for the tidy sum of \$174,000,000. For three weeks hundreds of thousands of men, women, and children, whose interest has been whetted by a campaign of advertising, have crowded the Tefft-Weller Building, 330 Broadway. The budget exhibit, which will continue throughout October, is interesting, illuminating, educating, and at the same time baffling, confusing, and bewildering, for New York is so vast an enterprise that this laboratory exhibit can but reflect its complexity. The exhibit has two elements, the spectacular and the statistical. It is a paradise for the sta-

tistician and not unlike a circus for the child, whose interest is keen in many of the practical exhibits of equipment, such as those of the police and fire departments.

At the entrance are eighty golden cubes, varying in shape and size, which represent the total amount allotted to each department this year, as well as the relation one departmental appropriation bears to another and to the whole budget. After these are passed, startling statistical tables and hundreds of photographs confront the eye from every angle. In a relatively small space information is marshalled in such a way that the eye may take in at a glance the expenditure of tens of millions of dollars. The displays of most of the departments are on the main floor. Upstairs is that of the Board of Education and in the basement are the bulkier exhibits of the fire, police, and street-cleaning departments. A number of bureaus occupy the same places that were allotted to them last year, so that those who went then feel a bit at home, especially as a few of the exhibits are the same.

As was true a year ago the uniform note of the entire show, for it is a show and a good one, is that every effort is being made to use money economically, but that larger sums could profitably be employed. Each department represented tries to show convincingly how necessary it is that it should have a much larger appropriation. The plea for more money is almost everywhere uppermost. But the citizen is now able to understand

FATHER KNICKERBOCKER TAKING ACCOUNT OF STOCK.
The entrance to the New York budget exhibit.

more easily than in former years the myriad necessary purposes for which tax money is spent, and under what varying conditions. Citizens are introduced to the wants of other citizens who live at a distance of twenty miles from them in totally different surroundings. An omission of the exhibit is the failure to show how the funds are raised as clearly as it explains how they are spent. The sources of revenue now used and those that might be employed are not explained, nor are the effects of the present methods of raising money, although a request was made that the Board of Estimate should consider the subject of revenue as well as expenditure.

THE CITY AS A SOCIAL WORKER

The social worker, although interested in the problems of all of the city departments, feels better acquainted with the work of a few which touch more closely that of the many private organi-

zations for social progress. The Department of Health, which is asking taxpayers for an increase in its budget for 1912 of 52 per cent, emphasizes the need for medical inspection of school children, for more funds with which to fight consumption, for better care of patients with contagious diseases, and for milk stations. In fact, one of the most striking displays in the whole exhibit is the model of a spick-and-span municipal milk station with a nurse in charge. For next year the department wants \$308,890 for seventy-three milk stations. This is an increase of \$269,290. The department as an argument for this increase shows that whereas the death rate of babies under one year of age for the whole city for the first nine months in 1910 was 142.3 per thousand, in 1911 as a result of increased effort it was but 124.6. Of the 3997 babies cared for in the municipal milk stations from April 22 to September 15, but eighty-five died—less than 2.2 per cent.

A MODEL MILK STATION.

The Board of Health wants seventy-three of these.

The Board of Education exhibits an interesting model of one of its 109 summer playgrounds. The Park Department for Manhattan also features its playgrounds and displays some of the equipment made by the children. Bellevue hospital explains in detail how it has cared for 2251 tuberculosis patients. The Tenement House Department, besides indicating some of the forms of dilapidated buildings that it has to guard against, as well as the sanitary evils it is fighting, gives copies of a few of the complaints it received. This department seems to be regarded as a paternal institution.

Dear Sir:—

Will you kindly inform what to do about a cat my neighbor will not keep in their own apartments—they turn it out at night—It comes in with the opening of doors of my apartment.—Anymore remarks on my part is likely to raise trouble and gurling (growling).

P. S.—It also eats out of my ice-box.

Yours respectfully,

Tenement House Department,
City of New York.

I want you to come and inspect the sink of our house. We have seen a snake come out of a hole and go in. The same thing was seen in the basement of the house.

Yours respectfully,

A popular exhibit is that of the Bureau of Weights and Measures, which shows some of the deceptive measures and weights found in its inspection of 60,000 stores. A striking showing is made by the Commission on Standardization which by new specifications for buying fresh meat in carcass form was able to reduce the meat bill in Bellevue and allied hospitals by 15 per cent. This economy will be duplicated in the health department, which has adopted the new system. In these specifications the commission followed the method employed by the Departments of Public Charities and Correction. This is but one instance of the kind of work the commission is doing.

WHERE HOUSEWIVES LEARN SELF-PROTECTION.

The exhibit of the Mayor's Bureau of Weights and Measures attracted many persons, both last year and this.

The police department shows, on a huge map, the position at night under the new system of stationary posts of every man in Manhattan. Among the realistic exhibits which almost make the visitor forget where he is are reproductions of a complaint desk at a police station, the corner of a public library, a dentistry clinic, a concrete fire-proof building, completely furnished with appliances both for preventing a fire and for sounding an alarm. Automatic sprinklers, standpipe attachments, buckets, axes, fire-hooks, extinguishers, metal doors, shutters, and even metal furniture are

part of the equipment of this sample fire-proof building. With the memory of the Asch fire still keen, this exhibit attracts many people.

A feature of the budget campaign this year has been the effort to interest churches, schools, colleges, and tax-payers' organizations to visit the exhibit. The principal of Washington Irving High School has sent his different classes under their various instructors of English, mathematics, etc., to see it. President Davis of Normal College expects practically all of his teachers and pupils to go in sections. President Lattimore

of Adelphi College, Brooklyn, has arranged for the students in civics to go with teachers. Steven's Institute of Technology, Hoboken, is to go in a body 400 strong, and Prof. Rowe of the University of Pennsylvania is bringing over several classes in public finance. The Y. M. C. A. School of Accountancy in Brooklyn and some of the other classes of the New York School of Accountancy and Finance are likewise studying this object lesson in municipal business.

Among other special groups to visit the exhibit have been ministers who wish to prepare sermons or references or bulletins regarding it, and a delegation of the Women's Municipal League. On Columbus Day 125 members of the Teachers' College course on school administration spent two hours at the exhibit under the guidance of Robert B. McIntyre, chairman of the Budget Exhibit Committee, and members of the Bureau of Municipal Research.

CITY ORDINANCES FOR FIRE TRAPS

That Boston is taking to heart the lesson of the Chelsea fire which destroyed the homes of tens of thousands of people is shown by the recommendations of radical changes which the committee on fire prevention of the Boston Chamber of Commerce makes after a year's investigation. The committee wishes to prevent a second holocaust which it believes is hovering over Boston; for in the Dorchester and Roxbury districts the continuous blocks of cheaply constructed "three-deckers" are dangerous fire hazards. The loss has thus far been very light, but the danger of a disaster which would sweep out blocks at a time is always present. To reduce this risk the committee recommends the enactment of city ordinances which will prohibit, within the city limits, buildings which constitute such great risks.

The committee insists that nothing but first-class, fire-proof buildings should be erected in the congested districts, and concludes that:

Even in our large cities where fire-proof buildings have become general, there are still in existence groups of buildings which on the

interior are largely constructed of wood. These so-called second-class buildings make possible a conflagration at any time. Such a holocaust as has been experienced by Elizabeth, Chelsea, Baltimore, San Francisco, Portland, and Bangor may be expected in Boston at any time.

The number of deaths due to fire is also out of all reasonable proportion in this country, over 6,000 people having lost their lives in one year. The loss of life in foreign countries is small. All rules and regulations which tend toward the reduction of fire waste will, of course, reduce this loss of life. Recent experiences in this country, particularly the fire of April 7, 1911, in New York city, show an utter disregard for law and reasonable conditions of safety.

To fix responsibility and insure publicity for every fire the committee recommends the organization of a fire bureau, the duty of which would be to determine the cause of every fire and to locate the responsibility in much the same manner as a coroner's jury investigates a death.

The bureau would also be charged with the duty of preparing and publishing regulations which would minimize the effects of carelessness, provide for safety of life, and for educating the public in the simpler facts and methods of fire protection.

To prevent carelessness or deliberate mismanagement it is recommended that a law be passed "regulating the issuing of fire insurance covering any building previous to approval by formal act of said fire bureau." Other recommendations are for the installation of a high-pressure fire service in the congested portions of the city and the adoption of motor apparatus. The preface of the report states that because of carelessness American municipalities lose \$250,000,000 worth of property a year—"a quarter as much as we build up."

Not less remarkable is the complacency with which the public views this destruction. Even though the seriousness is repeatedly brought to attention of the public by the daily press and by reports of insurance organizations, the average citizen seems well content to let things go as they are, without making any move toward improvement.

The money loss by no means represents the real cost of fire. The consequential loss due to sacrifice of lives, damage to business and homes, interruption of employment for many persons, and to general derangement of civic functions is so large that one dare not try to estimate it.

The comparison of per capita losses in this country and Europe—\$2.50 in the United States, 33 cents in Europe—is so startling that

it suggests a study of the relative conditions to see if the methods which prevail in foreign countries could be introduced here. An investigation of foreign conditions as compared with those in this country brings out that:

The building construction is much better on the average, and in some cities practically all buildings are of fire-proof construction.

Building laws are rigidly enforced, and frequent inspections are made.

A well organized fire marshall system exists in practically every city and the causes of all fires are investigated. A fire is considered a crime and the guilty punished, resulting in much greater individual responsibility.

The fire departments in foreign countries are certainly no better than ours and probably on the average are not as good. The preventive measures mentioned above are the fundamental reasons for freedom from fire waste.

ST. LOUIS WORKHOUSE IS SCORED BY REPORT

The Social Service Committee of the Civic League has just issued its report on the St. Louis workhouse. It recommends the prevention of vermin, the improvement of food, the doing away with the dungeon, the establishment of a night school, better classification, and better hospital advantages. The removal of the institution to a farm is urged. In common with petty magistrates throughout the country, the St. Louis judges impose fines with the option of the convicted person's going to jail if he cannot pay. Of this system the report says:

The most conspicuous unfairness of this system is found in the imprisonment of men for the non-payment of fines. In imposing a fine, instead of a term sentence, the court says that the offender ought not to be sent to prison. But in spite of that, he is committed, not because the court thought that a proper punishment, but because he is too poor to pay his debt to the state at a moment's notice. The private citizen can no longer collect his debts by imprisoning his debtor, but the state does it, compels him to associate with the worst of men, and turns him out with the stigma of "jail-bird."

If imprisonment were necessary it might be condoned, but it has been proved that by putting a man on probation, giving him time to earn and pay his fine, the court gets far more money than the prison collects. The public now pays for his commitment, supports the prisoner for a time, and does not get the fine. The prisoner is also prevented from working and supporting his family.

The system discriminates between the well-to-do and the poor. The former escapes imprisonment by the payment of a few dollars; the latter is punished for being poor.

NEW SOCIAL PROGRAM FOR ITALIAN CITIES

The recently organized *Associazione Italiana di Liberi Credenti* has established headquarters at 44 Via Margherita, Florence with Signor Gaetano Conte as general secretary. There are branches in Venice, Milan, and Palermo, and the work is under way in Florence, Bologna, and Rome. Signor Conte was for many years a valued member of Boston's group of social workers. Some time ago he returned to Italy and has been pastor of Methodist churches in Palermo and Venice. Certain urgent social needs of the country led to the organization of this society. Its leading purposes are stated as:

1. Civic and moral training in the public schools.
2. Increased effectiveness in and access to the public libraries.
3. Participation by the people in law-making.
4. Hygiene a concern of school and church.
5. More social work and less controversial discussion in the churches.
6. The administration of public charity on a scientific basis.
7. Opposition to the lottery, unsanitary housing, and other sources of immorality.

EDITORIAL GRIST

THE NATION'S HEALTH

WM. JAY SCHIEFFELIN

More and more intelligent interest is centering on the subject of the nation's health. The number of articles appearing in the newspapers and the magazines and the practically unanimous approval of the president's action in supporting Dr. Harvey W. Wiley are proof of the growing importance of this question. The endeavor to oust Dr. Wiley had such an absolutely opposite effect that those who promoted it are left in a ludicrous position. Everybody knows that he is honest; and the president as well as the people would not tolerate an attempt to force his resignation on ac-

count of a technical charge which insinuated that he had connived at improper salary arrangements.

Few crimes are meaner than the adulteration of foods or drugs, and the evidence that Dr. Wiley had been hampered in his efforts to bring many cases to trial justly aroused intense indignation. This conspiracy against Dr. Wiley has again brought into prominence the question: Why should these important health matters be under the control of the Department of Agriculture?

One of the most important measures now pending in Congress is the proposition to establish a national Department of Health. It has been computed that sickness and death cost this nation \$3,000,000,000 annually, if the value of the labor lost is capitalized. In the United States every year there are 1,300,000 deaths, of which 630,000, according to reliable authorities, are due to preventable causes. For many years our national government has expended an enormous amount of money annually in ascertaining and telling the farmers how to prevent diseases among hogs, cattle, and other animals. This is entirely proper, because it helps to conserve the material resources of the nation; but owing to the lack of necessary legislation, the government has not done nearly as much towards the conservation of human life. It has been said that the United States is the laughing-stock of Europe because of the fact that its health agencies are distributed among the Treasury Department, the Department of Agriculture, and other departments, while its people are dying from preventable causes at the rate of one every minute. This is a deplorable situation which the various states are unable to control; but if we had a Department of Health with the tremendous facilities of the national government at its command, it could gather and disseminate among the people information which would result in greatly improving their health and in largely reducing the death rate. Leading insurance companies are now making active efforts to prevent disease among their policy-holders, because they realize that it helps their business to prolong life as far as possible. The most valuable asset

of any nation is the health of its people, and there can be no more effective method of conserving human life than the spread of sanitary knowledge by the Department of Health of our national government.

It is a satire on our civilization that so much blind opposition should be offered to this attempt to conserve the lives of the people. Nobody suggested or intended that the measure to unite the government health agencies and to spread sanitary knowledge throughout the whole country would mean a campaign against the Christian Scientists and others.

Their apprehension almost amounts to an admission of a guilty conscience, but their zeal has evidently supplied a large fund for lobbying purposes and newspaper advertising, which has not been without its effect in delaying action by Congress; but now the tide has set in the direction of this reform, and there appears to be every probability at the next session of Congress the bill for the establishment of the Department of Health will be enacted. When this is brought about, it will be largely due to the character and the fighting ability of Harvey W. Wiley.

CHILD LABOR CAMPAIGN IN THE SOUTH

A. J. McKELWAY

With the adjournment of the Georgia Legislature, the legislative campaign for better protection of working children in the southern states ended for this year. It may be of interest to friends of the children to note the progress made in spite of opposition by employers. John P. Hollis, agent of the National Child Labor Committee, was in charge of campaigns in North and South Carolina. In North Carolina, the cotton manufacturers appeared before the legislative committee in opposition to any strengthening of the law. The committees in the House and Senate were, as usually in recent years, in favor of the manufacturing interests. The child labor bill advocated by the State Child Labor Committee was reported unfavorably. The only gain was the passage of the bill fixing a sixty-hour

week instead of the sixty-six hour week heretofore allowed in North Carolina. This shortens each working day one hour, though the sixty-hour week is to be distinguished from the ten-hour day. The sixty-hour week in cotton factories means generally an eleven-hour day for the five days, with a half-holiday on Saturday.

In South Carolina, manufacturers seem to have grown chary of opposing child labor legislation in the open. They have been hammered long enough to become a little sensitive to public opinion, and their attack this year was made before the State Child Labor Committee. The committee had agreed upon a program embracing a fourteen-year age limit. But upon threats of the cotton manufacturers that they would oppose any child labor legislation, unless this program was abandoned, an agreement was made to eliminate children under twelve years of age, who have heretofore been employed in South Carolina during vacation, or if they happened to be the children of dependent parents. A sixteen-year age limit was agreed upon for night work, and the certificate plan was changed to the end of greater effectiveness. These provisions take effect January 1, 1912. Governor Blease, however, vetoed the items of the appropriation bill providing for the salaries of two factory inspectors. We understand, however, that they are continuing their work by an arrangement made by Commissioner Watson, and it is hoped that the next Legislature will make ample provision for them, even if it has to over-ride the governor's veto.

In Florida, the child labor bill raising the age limit to fourteen years was defeated, and a bill for the creation of a bureau of labor passed one house and died upon the calendar in the other through want of time to reach it. The chief opponent of these bills was John G. Ruge of Apalachicola, Fla., who is interested in the employment of very young children in the oyster canneries of the gulf coast as well as in the cotton mills of Georgia. If we mistake not, the people of Florida are tiring of Mr. Ruge's attitude, and his appeals to ignorance and prejudice have probably reached the end of their effectiveness.

The child labor bill in Tennessee was introduced just before the emigration of a part of the membership of the Legislature to Alabama to prevent a quorum. During the interim, the Supreme Court of Tennessee declared the child labor law unconstitutional on technical grounds, the statute raising the age limit from twelve to fourteen years being held to be broader than the title of the act. When a quorum was finally established, effective representations were made for the enactment of a better child labor law. The cotton manufacturers had agreed to the passage of this bill before the Supreme Court rendered its decision, and the bill passed by a practically unanimous vote, being perhaps the only measure on which all of the political factions in Tennessee united. It fixes a fourteen-year age limit for factories and workshops, and for children employed in carrying of merchandise or messages; a fourteen-year limit for all occupations except agricultural and domestic service during the school term; a sixteen-year limit for dangerous occupations; and an eighteen-year age limit for the night messenger service. During the same session the factory inspection law was changed to secure greater efficiency, the salary of the factory inspector increased from \$1200 to \$1500, and a reasonable appropriation made for traveling and office expenses.

Partly on account of the heated controversy over the repeal of the state prohibition law, the only progress made in Alabama was the addition of an assistant to the office of the factory inspector and the securing of a larger appropriation. The child labor bill was not reached on the calendar, and the Alabama law will therefore remain unchanged for four years, unless there is an extra session of the Legislature.

A joint committee was formed in Texas in the interest of child labor legislation. It was composed of a committee from the labor unions, one from the women's clubs, and one from the State Charities Association. An enlightened child labor bill was introduced, but it was torn to pieces in the Legislature, the only thing that remained being the fifteen-year age limit for the employment of children in factories, and in dangerous

and immoral occupations. The new commissioner of labor seems earnest in his efforts to enforce the law, and the friends of the children in Texas are doubly resolved that the next Legislature shall enact a standard child labor law.

In Arkansas, the State Child Labor Committee agreed upon an excellent program of child labor legislation, but their efforts were unsuccessful. A good juvenile court law was secured, however, and the number of counties included under the new compulsory education law was increased from one-third to two-thirds of the number in the state. Of course this provision affects the working children in these counties, and may be considered a substantial gain in the matter of their protection.

The action of these states left Georgia occupying a bad eminence as the only commonwealth allowing children under twelve years to work in factories, and the only state with a sixty-six hour week for children. Three bills were introduced in the Georgia Legislature to do away with this disgraceful state of things; a child labor bill approximating the standard child labor law; a bill to reduce the hours of labor for workers in cotton and woolen mills from sixty-six a week to ten hours a day (House bill) or to a sixty-hour week (Senate bill); and a bill providing for a department of labor with a commissioner and assistant commissioner, with full powers for inspecting factories and enforcing laws for the protection of working women and children. All three were reported favorably by the House Committee. The Department of Labor Bill passed the House by an overwhelming vote, and the bill providing for a ten-hour day for workers in cotton and woolen mills passed the same body by a vote of 128 to 40. On account of a prolonged filibuster against an amendment to the state prohibition law, the child labor bill was not reached in the House. The cotton manufacturers at first opposed all legislation and employed two former members of the legislature, lawyers, as lobbyists. The passage of the ten-hour day bill in the House, which would have virtually diminished the hours of labor by two a day, alarmed the cotton manufacturers. They thereupon circulated

petitions among their employes, asking for the sixty-hour week, but protesting against the ten-hour day, on the ground that it would mean too serious a cut in their wages. A meeting of the Georgia Industrial Association was called, and some eighty manufacturers attended, presenting themselves the same afternoon before the two committees in the Senate to which had been referred the Department of Labor bill and the hours of labor bills. The bill reducing the hours from sixty-six to sixty was virtually agreed upon in the Senate. Representative Tarver, who comes from a cotton-mill town, was disposed to resist the Senate measure, but finally recognizing that in the closing hours of the session both measures might be lost, he agreed to the Senate bill and it passed the House without amendment. It does not take effect until January 1, and employes, by additional hours, are allowed to make up lost time, not to exceed ten days.

There was a still more desperate struggle over the bill providing for a department of labor. The two lawyers in the employ of the cotton-mill men devoted their whole time to work upon the Senate. Finally, after a dreary and driveling debate, so far as the opposition was concerned, it passed the Senate by a majority of one, and was later accepted by the House. Farm labor, including work on the turpentine farms, and saw-mill labor were exempted from the supervision of the department. An amendment to exempt the cotton and woolen mills from supervision by a department mainly designed to enforce the child labor law was barely defeated by a vote of 22 to 18! Another amendment, which originated in the Senate, makes the office of commissioner elective instead of appointive, and this will give the cotton manufacturers the opportunity to control the election of some one devoted to the interests of the employers, as has so long been the case in Pennsylvania.

However, the department has now been created and provision made for the enforcement of whatever laws we have or may hereafter have in Georgia for the protection of working women and children. The Hours of Labor Act is an amendment to the code of Georgia. The

old code provided that no minor child should be employed except between the hours of sunrise and sunset. This still holds good for other manufacturing enterprises, but, with the growth of the cotton and woolen industry, exception was made for the cotton and woolen mills, allowing a sixty-six hour week. It would be interesting to have a test made of the new Georgia law. It applies to all the employes of cotton and woolen mills. The report of the Bureau of Labor shows that 55 per cent of these employes are women, or boys and girls under sixteen years of age. It would be interesting to know whether the Supreme Court would apply the principle of amendment XIV, as to the right of contract of adult males, to an industry employing such a large proportion of women and children. In the fight for the hours of labor bill before the Senate committee, the calamity howls of the cotton manufacturers were discounted in advance by the quotations from the speeches the same gentlemen made in 1905 and 1906 when the Georgia child labor law was in process of enactment. Jack Spalding referred to the child labor bill then as "a line of legislation that the manufacturers know from experience means ruin to this state as it has meant ruin to other states."

Mr. Kincaid, another manufacturer, said that the passage of the bill would be "one of the most harmful things ever done by the state of Georgia. . . . The passage of this bill would do more harm than all the bills passed since the war. I have been to New England and know the conditions there, I know how these laws have hurt them, and if you want to ruin Georgia, just adopt the same kind of laws that they have got there."

Dr. Jeff Davis, president of the Georgia Industrial Association, published a letter July 6, 1906, saying of the child labor bill: "There are now about 300,000 spindles standing idle in Georgia for the want of laborers, and the enforcement of this bill will stop the hum of another 300,000, if not more."

Dr. Turner, late president of the Exposition Mills of Atlanta, said, "The fourth section will make us stop the mills and send the children to school."

Ex-Senator Hand, a member of the

Georgia Senate in 1906, brought out the information that by stopping 300,000 spindles there would be a reduction in the consumption of cotton amounting to 150,000 bales. Ex-Senator Hand appeared again in opposition to the hours of labor bill at this session of the Legislature. But it was common knowledge that the Southern cotton mills are not now suffering from scarcity of labor. Some of them have shut down for a time, some have gone into bankruptcy, others are being absorbed by a combination which may soon assume the proportions of a trust, many are running on short time, three or four days a week. But the trouble now is over-production of the coarse goods which are made almost exclusively in the South. The increase by the million of new spindles in England and the building of 108 large, well-equipped mills in Japan last year are factors of the situation which cannot be ignored, since, with the ever broadening demand for cotton goods, the mills of England and Japan are crowding the Southern cheaply-made and child-made goods out of the Oriental markets; at the same time the demand for cotton has kept up the price of raw material, so that the margin of profit has been small, even for the protected home market. For these reasons this is the time when restrictions concerning the employment of labor that is not needed could be made with the least injury. But the cotton manufacturers really seem to be in a panic concerning their present situation, and are averse to any restrictive legislation.

The debate in favor of continuing the inhuman schedule of hours of the former Georgia law would hardly be of interest to readers of THE SURVEY. The argument of Senator Hand that the cotton-mill operatives could work longer hours in the South than in the North because the New England climate is a great deal more enervating than the Southern climate is, however, worth quotation. This was received as a sober statement of fact, and the committee solemnly agreed that the eleven-hour day instead of the ten-hour was the proper working period for ten- and twelve-year old children in Georgia.

CIVICS

HELPING THE PUBLIC UNDERSTAND THE PUBLIC SCHOOLS

WILLIAM H. ALLEN

Director Bureau of Municipal Research, New York City

So characteristic of the present year are school inquiries that 1911 is certain to go down in history as marking a change in the attitude of American educators toward their working material — their pupils and their publics. The nearly 20,000,000 children

TESTED COWS NEAR PACIFIC, MO.

This is a portion of the herd which supplies dairy products exclusively to the high school lunch-rooms in St. Louis.

registered this fall in public, parochial, and private schools will be studied, understood, and helped as never before.

Montclair, a city of 20,000, has just published the important results of a four days' study by Prof. Paul H. Hanus, now in charge of the comprehensive inquiry by the board of estimate into New York city's school system. The National Bureau of Education has made public the results of a month's study of Baltimore's schools by Dr. Elmer E. Brown, former United States commissioner of education, Prof. Ellwood P. Cubberley of the University of California, and Calvin N. Kendall, formerly of Indianapolis, and now state superintendent of New Jersey.

Special reports on investigations of the business management of the Cleveland and St. Louis schools will soon be published, and there are available a number of important documents dealing with the all-year school, intermediate school, school mortality, shorter course, emphasis upon the three R's, etc., by Superintendent Elson of Cleveland and his colleague, Dr. Frank P. Bachman, now assisting with the New York inquiry. State Commissioner Howell Cheney, a manufacturer profiting from efficiency tests, has set the machinery of a number of Connecticut cities toward self-analysis and has published some valuable bulletins. So marked is this tendency to find out what, the where, the why, and the way out, that even Rochester, famed far and wide for its efficient small paid board, is beginning to compare its school results with

its opportunity. A southern school man advertises help to school boards on an engraved card that reads "Consulting educationist."

This contagion of auto-inquiry attacked even the insurgent-swept National Education Association at

San Francisco, and it appropriated no less than \$6,000 for several school inquiries.

While it is easier to watch the actions of school men at a national convention or in broadly advertised inquiries in the larger cities, even greater importance must attach to the serious continuous study of their own schools by scores of superintendents in small and large cities.

Superintendent Frank E. Spaulding, of Newton, Mass., says:

"In several conspicuous cities those charged with the investigation of the educational department have not been connected with the school system in question, in fact have been comparative strangers to it. Before resorting, however, to such outside aid, it would seem to be the part of wisdom to answer ourselves such questions as are bound to be raised regarding the amounts of various expenditures and the reasons for each; if our answers are unenlightening, unsatisfactory, and unconvincing, then we may well turn to others for assistance."

Thus for the first time in the history of educational discussions in the United States we are getting a democratic basis for consideration of school problems, where the able man with a small school can, by reporting facts as to retardation, physical examination, or amendment of curriculum, earn higher rank as an educator than the superintendent of a large city school system who neither seeks nor admits the truth.

The layman who has not tried to learn which children fail of promotion will be surprised when told that in all probability his

IRRIGATION AT PARENTAL SCHOOL, SPOKANE, WASH.

edies at teachers' meetings; vacation catch-up classes; special reports by teachers on doubtful pupils and conference with their parents as to the meaning of failure; better enforcement of the compulsory attendance law, with special reference to catching the incipient case (the child after the first absence or two), instead of the chronic case of truancy.

Studying school problems from the standpoint of the child has been prompted by the wholesale adoption of examination for physical defects. Because the first experiments in removing adenoids and eye troubles

school superintendent has no idea what proportion of the children in each grade are not promoted and the probable reasons. If you will look at your school report, you will probably find that the total number of children on the rolls during the year is put in one column, and the total not promoted, if given at all, in another, and that is all you are told. Possibly instead of the total registered you are given some "mythical average number belonging," or "average attendance." The study of retardation which is now sweeping the country finds out the *total number of possibilities of promotion* after subtracting the deaths, removals from the city, etc. When, in this manner, the non-promotions are obtained, investigators try to learn the relation of physical defects to non-promotions, how many children are over age for their class or under age, how many have failed once only or twice or more than twice, and perhaps in what subjects and with what teachers failures are highest.

Among the causes of non-promotion the study of children has brought out the following:

Illness; absence due to illness; absence due to truancy; late entrance; changing school; foreign parentage; physical defects; mental defects; immaturity; slow development; home conditions; neglect; home work; inattention; cigarettes; nervousness; laziness; lack of general ability; inefficient teaching."

Finding causes soon leads to remedies such as:

Special night and day study-rooms for children whose home conditions do not permit study; thorough canvass of causes and rem-

were followed by rapid progress in school, school men and women took it for granted that finding the defect would of course lead to remedy. But from one end of the country to the other finding the defect has led often to nothing more than piling up records of physical defects. Then come efforts to learn the reasons, and then the house-to-house instruction of mothers, and a long list of remedial steps which are imposing when put together, but which unfortunately are more apt to be found isolated than in clusters.

Inquiry and challenge being in the air, editorials in newspapers and magazines have raised questions in the minds of parents, taxpayers, mayors, etc. Each school man is coming to feel that until he has explained the situation of his schools to his own constituency he is on the defensive. Thus gradually—no, rapidly—the audience for school reports is changing from one's fellow superintendents, or from the students of education in colleges, or posterity, to the men and women who support the schools about which the superintendent is writing.

Perfunctory school reports will soon be a thing of the past. Even interesting school reports are not enough. They must be enlightening and convincing. To enlighten and to convince as well as to interest, many superintendents are employing the art which has given newspapers and magazines and advertising specialists their enormous circulation, namely, illustrations.

Topeka leads with no less than fifty-three attractive illustrations of buildings, handiwork, assembly rooms, etc; Columbus, Ga.,

follows with forty-two; Spokane with thirty; St. Louis with twenty-four; Macon, Ga., and Salt Lake City with twenty-three; East St. Louis with fourteen; Pittsburgh with thirteen; Newton, Mass., and Pasadena, Cal., with twelve; Waterbury, Conn., with eleven; Glens Falls, N. Y., with ten; Montclair, N. J., with nine; Newark, N. J., Chester, Pa., Aurora and Cairo, Ill., with eight; Pueblo, Colo., Chicago, Michigan City, Ind., Lexington, Ky., Grand Rapids Mich., and Portland, Ore., with seven; New York, Denver, Boston, Kansas City, Reading, Newport, and Hoboken have none, although several of these, notably New York and Hoboken, have made liberal use of photographs in special statements in the press.

A SCHOOL MACHINE-ROOM, SOMERVILLE, MASS.

Perhaps the best illustration of the *argumentum ad hominem* is the Newton school report, which as a public document must be classed as of the very highest order, not only in its effort to explain its business to the public, but in its form of presentation. Starting with the great increase of the expense of the Newton schools and with the rambling uninformed public criticisms, Superintendent Spaulding says:

"I propose to devote this report chiefly to an attempt to tell everyone who wishes to know just why school expenses in Newton have increased so largely in recent years, for what money is being spent, and just how much is being spent for each of the many things and activities which are a part of the school system."

His form of treatment is as follows:

I. Why did instruction cost more by.....	\$6.36
Regular classroom instruction cost more	\$3.50
Special instruction, supervision, and administration within the schools cost more.....	2.86
Total increased cost.....	\$6.36
II. Why did regular class-room instruction cost more by.....	\$3.50
On account of the increased average salary of class-room teachers	\$2.43
On account of smaller classes....	1.07
Total increased cost.....	\$3.50

In addition to the direct appeal to the individual and to the mass through the school

report, city superintendents are making direct bids for civic cooperation. Superintendent Christensen, of Salt Lake City, attributes an increase of attendance and enrollment to the increased number of parents' visits. Superintendent Cave, of Bellingham, Wash., says:

"I have never known a normal child who could not be reached by the school, provided the support of the parents was on the side of the school, nor have I ever known of the child who could be wholly reached, provided the support of the parents could not be depended upon."

No one has ever expressed better the attitude that should prevail among both superintendents and civic agencies than Superintendent Maxwell of New York city in his school report for 1905:

"I look forward with earnest hopefulness to the day when every educational agency, civic or endowed, will not feel its duty done until it contributes freely of its resources to the advancement and benefit of the great American and Americanizing institution of free education."

That day, of course, can never come until places where laymen can take hold are suggested by the school men themselves. School reports must list needs not yet met, work remaining to be done. Superintendent Brittain of Hyde Park, Mass., not only gives such a list, but tells exactly how much it will cost to install each improvement and to maintain it.

Hopeful as the outlook is, and sweeping as have been the improvements, what remains to be done requires constant promotion by some national agency equipped with funds to make available to all school men the best ex-

perience of each. The best time to hear of a proposed investigation is while the plan for it is still in progress. The best time to secure the results is immediately after they have been compiled. As Superintendent Poland of Newark says in his report:

"It is surprising indeed what ignorance prevails even among superintendents in large cities as to what the rest of the school world is doing. The widest dissemination of school information is needed, or otherwise there is apt to be little progress and great waste in experimentation."

A part of this field should be covered by the United States Bureau of Education. Why should it not publish in monthly digest the counterpart of the *Review of Reviews* in the magazine world, where school men may find in brief form the best of formal utterances by their colleagues in all parts of the country? Why should not state superintendents render a similar service for the school reports within their own states?

The need would be met by another national clearing-house with the latitude that thus far has been found possible only by private agencies—something like the Carnegie Foundation for the Advancement of Teaching—which would cover the secondary and primary schools, public, private, and parochial. Such a foundation could universalize efficient method and sound idea by means of reiteration. Again, as Superintendent Poland says:

"Such common expressions as average attendance, average school membership, per capita cost of school maintenance, have no exact significance until they are read in the light of other facts sometimes difficult or impossible to ascertain from the reports that are now published."

Between conceding the futility of reporting in general and admitting the futility of his own reports there is a great gap for practically every superintendent. Between observing the futility of his own reports and making those reports adequate is another gap for practically every superintendent. To fill that gap properly there should be someone to whom application can be made for suggestion and assistance. Moreover, there should be someone constantly asking questions and putting on pressure to get done to-morrow what today resolves to do. No man can write a proper school report after June 30 who did not ask the significant school questions before the preceding September and for each succes-

sive day during the school year. Adequate records will, however, follow a desire to know something that is not yet known. To stimulate that desire should be the function of some national fund which would be unremittingly at work distributing among school men questions and suggestions for giving the slowest and the weakest superintendent the benefit of the experience and method of the most efficient. That such a foundation would be welcome has been proved by questions sent to the Bureau of Municipal Research which, with a modest fund of \$10,000, spent in a period of over two years, has been able to send out about 200 such reports to 500 city and state superintendents.

HOUSING IN CANADA

JOHN IHLDER

Field Secretary National Housing Association

In Canada official recognition is given to the fact that the health and lives of the people are as well worth conservation as are natural resources. The Canadian Commission of Conservation has issued, under one cover, a report on Agricultural Work in Ontario and an address on Unsanitary Housing by Dr. Charles A. Hodgetts, medical adviser to the committee on public health of the Commission of Conservation.

At this time, when the people of the United States are painfully awakening to the fact that their loudly acclaimed cities of homes contain not only single houses but whole districts where the word home can be applied only in the bitterest irony, the Canadians are having presented to them some facts which call for serious attention. Not only in the old cities of Quebec and Montreal, but in younger and most attractive Toronto, and even in infant Winnipeg, conditions have developed which make inevitably for the moral and physical degeneration of the people. In all these cities, as in their American prototypes, the slum has appeared.

The points made by Dr. Hodgetts may be stated briefly as:

Unsanitary conditions due to lack of water and toilet facilities; tenement evils due to the overcrowding of buildings on land; shack houses without any provisions for wholesome and decent living; and room overcrowding with its inevitable results in physical and moral degeneration.

All these affect not only the very poor, but also the laboring man and his family. No one

who has given any thought to the subject is ignorant of the price in sickness and death which our cities pay for the privilege of permitting the continued existence of privies in thickly settled districts, for the conversion of old single-family dwellings into warrens to accommodate from six to a dozen families, with no adequate provision for light or ventilation, water-supply, or toilet facilities. But this paper brings out a point upon which we have not been accustomed to lay much stress—the building of shack suburbs.

“Should the married man live in the suburbs, it is perhaps in a shack town, the whole family being crowded into one or two rooms intended to serve as a kitchen annex to the house he hopes to build. His great expectations are slow to materialize and frequently he, or some other member of his family, dies in the making of a home—victims of unsanitary housing. This is an example of the working-man being the victim of land speculators whose sugar-coated offers have led him to launch out on a scheme of housing which they knew well it was difficult for him to carry to a successful issue. The man has paid too heavily for his land and finds the cost of building plus the interest and annual payment a greater burden than he contemplated. It is the lure of the land speculator.”

Even worse in some respects in its effect on the community is the shack town of wooden-walled, tar-paper-covered, tin-tack-studded sheds intended for the temporary occupancy of newly arrived immigrants. These often become the overcrowded, permanent homes of a foreign population which pays exorbitant prices for the accommodation it secures. The provincial board of health of Ontario describes such a colony as Sault Ste. Marie:

“This colony is crowded into a lot of miserable shacks, filthy both outside and inside; no cellars, no drainage, closets on the surface of the ground, vile beyond description; water from shallow wells, which were dirty and unfit for use, and most of them located within a few feet of the closets.”

Were this the only shack in town of its kind in Canada, the situation would be bad enough to shock the optimistic nation-builders of the north into some constructive action. But

A SLUM HOME IN TORONTO.

This scene shows the conditions in a lane just off the main business street.

instead it is typical of many. And what is true in Canada is true south of the boundary line.

The remedy, as the Canadian leaders see it, is not the building of model tenements. The registrar-general of Ontario says:

“There are also many other lines upon which improvements can be made, such as the housing of the poorer classes, preferably in detached houses or cottages,¹ the preventing of overcrowding, and I would go so far as recommending legislation to prevent, under certain conditions, the erection of the tenement. They are a damnable architectural invention, and their erection should be carefully considered. Space is what we require, so that fresh air and sunlight may be enjoyed by all.”

The danger which awaits those who rush into the erection of “model” buildings without studying the subject thoroughly is indicated by Dr. Elzear Pelletier, secretary of the Quebec Board of Health, who found that

“some so-called improved dwellings are constructed in which half of the rooms are lighted from enclosed yards, which consequently contain only stagnant air.”

So the burden of improving housing conditions on a scale commensurate with the need falls upon the public authorities, supported by an intelligent and vigorous public opinion. But in order that the authorities may act they must have proper legislation. Dr. Hodgetts believes the health officers might do more than they have, but has an excuse for them in that,

¹If detached they should be at least fifteen feet apart, otherwise solid rows of shallow houses giving light and ventilation to every room from front or rear are far better.—J. I.

as a rule, the health officer has to take his cue from the local board and too often finds that the local board is composed of ward politicians instead of sanitarians.

In order to prove that the legal powers of the health officer and the board are very considerable he quotes from the laws of several provinces, and there exposes a weakness of which apparently he is unaware. For these laws instead of being explicit in their definitions of what constitute unsanitary conditions too often leave this to be determined by the administrative officer. For instance, in British Columbia the law reads:

"If the local board is satisfied upon examination by itself or officer that a cellar, room, tenement, etc., has become by reason of the number of occupants, want of cleanliness, the existence therein of a contagious or infectious disease, or other cause, unfit for such purpose . . ."

In Ontario:

"If upon such examination it is found that the premises are occupied by more persons than is *reasonable* for the health of such occupants, . . ."

In Quebec:

"When a house or other habitation is ascertained to be *unhealthy*, . . ."

Such laws as these invite a pressure upon the health officer from his board of "ward politicians" or from influential outsiders to which it is unfair that he should be exposed, and which must interfere with the vigorous

and impartial discharge of his duties.

And even where these Canadian laws are explicit they do not seem to lay down very stringent rules. Dr. Hodgetts quotes from the law of Saskatchewan—a province which certainly must have plenty of space despite recent American immigration—a provision which, he says, shows that the people there are in advance of those of some of the other provinces. This provision is to the effect that where a tenement is erected it shall occupy not more than 80 per cent of the total area of the lot.

"But if such building is bounded on three sides by streets or lanes 90 per cent may be built on."

On crowded Manhattan Island the law for ten years has set a standard of 70 per cent of the lot except that on corner lots buildings may occupy 90 per cent. Sparsely settled Saskatchewan would crowd its tenements more closely than does the second largest city in the world.

Since this article was written Dr. Charles J. Hastings, medical health officer of Toronto, has published an exceedingly interesting report on the housing conditions of that city. This report, showing as it does the development of the tenement, the unsanitary condition of old converted houses, and the unspeakably filthy conditions in many alley districts, where privy vaults overflow into the public alleys themselves, will probably be a shock to citizens of the charming Canadian city. But they should comfort themselves by the reflection that, having been awakened to disagreeable facts earlier than some of their neighbors, they may more quickly than those neighbors do away with the evils to which they can no longer close their eyes.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

TREES FOR COUNTRY HIGHWAYS

The County Forestry Commission of Los Angeles has applied to the Board of Supervisors for permission to set out 19,620 trees, at an approximate cost of \$25,000, on three great new highways which lead from Los Angeles to Long Beach, to Santa Monica, and to Pasadena. The total length of roadside to be planted is thirty-four miles.

DENVER'S PRIDE IN CIVIC CENTER

Of interesting significance is the fact that the official badge which was given to every delegate to the Denver Convention of the National Association of Real Estate Exchanges was a medallion showing a perspective of the splendid civic center which the people of Denver have voted to construct. Hanging from this medallion by ribbons of silver and gold was the seal of the combined city and county. Nothing could have spoken

more forcibly of Denver's pride in the great project, the very promise of which is making her famous. Yet when the plan was first broached there was an opposition which it took years to overcome.

A PROFITABLE BOULEVARD

The annual report of the Kansas City Park Commission is a richly illustrated pamphlet which contains a wealth of information. As the Kansas City park system is one of the most complete in the United States, the report is of exceptional interest. One of the many tables which it contains aims to show the effect upon property values of building a boulevard. Briefly stated, it appears that the assessed valuations of the land in the North and South Park Districts for the year 1898 (before Benton Boulevard was completed) was \$18,421,000. In 1910 the assessed land valuation in these districts was \$31,283,-

130. This represents a gain of 69.82 per cent, which is assumed to be the natural advance in land values in the section through which the boulevard runs. In 1898 the land fronting on what is now Benton Boulevard was assessed at \$131,415. Twelve years later the same frontage was valued at \$372,690, a gain of 183.62 per cent, or more than two and one-half times the large "natural" advance.

MANUAL FOR TEACHING CIVICS

Co-operation between the teachers of civics in the eighth grade of the Cincinnati public schools and numerous public-spirited citizens has led to the publication of a civics pamphlet for the use of teachers in Cincinnati. It is based on the principle that the teaching of civics "should be regarded as a piece of constructive work wherein, by a study of the local community and a comparison of it with other communities, the pupil arrives at a correct understanding of the fundamental principles of community life." The information contained in the pamphlet is arranged under general heads, such as the geography of the city; its history; the family in relation to the community (includes the tenement house problem); immigration; the protection of public health (includes a discussion of public works under various sub-heads such as water, sewage, etc.); the protection of life and property; the business life of the community (includes the labor problem); civic beauty; education; the care of dependents and delinquents; government; expenses and taxes. A list of books recommended for use in connection with the syllabus is supplemented by the statement that "teachers will find THE SURVEY particularly valuable."

RAILWAY GARDENING

Representatives of more than twenty railroads were present at the fifth annual meeting of the Railway Gardening Association held in Chicago a few weeks ago. The object of the association is "to consider a more thorough and systematic extension of railway gardening; to improve the appearance of all railroad way lands, especially those adjacent to passenger stations; to encourage the beautifying of grounds adjoining railroad property; to eliminate whatever unnecessarily detracts from the beauty of the landscape as seen from the car window; to stimulate universal interest in presenting more attractive appearances to the traveling public." It is encouraging to find that the list of papers, prepared by men who represented the Pennsylvania, Michigan Central, Illinois Central, Baltimore and Ohio, Canadian Pacific, and the Jersey Central Railroads, included such practical topics as the following: Fences and Hedges; Lawns; The Treatment of Cuts and Banks; Fertilizers; and, Should Railroads Purchase or Grow Their Stock?

THE MOST AMERICAN CLUB

The City Lunch Club of Rochester, which has been called "the most American club in

the country," has commenced its third year. The club's object is described in its annual report just issued as the "encouragement of intelligent civics by free discussion." Any man in Rochester can belong to it simply by virtue of attendance at the meetings. These meetings are luncheons held at one o'clock on Saturdays in a special dining-room of one of the hotels. To defray postage and other expenses there are dues of \$1 a year, but these are optional. The report states that during the last year forty-one meetings were held, with an average attendance of 110. The smallest number ever present was fifty, and the largest 300. The "membership" of the club is estimated at about 400, and of this number more than 300 paid the optional dues. The list of speakers last year included such men as Thomas M. Osborne Edward J. Ward, Max Eastman, Arnold W. Brunner, Joseph Fels, Dr. Grenfell, and Raymond Unwin, who all spoke without any fee-expense to the club. They were either passing through the city, or coming to it for other reasons, or came "because here was a group of busy, live men worth talking to—this was doubtless the best reason—and we paid them," says the report, "in the coinless currency on which is stamped the legend: 'These Men Inspired us to Better Citizenship.'"

MAKING A PARK SYSTEM

"No better illustration could be given of the making of a park system by a small city than the recent experience of La Crosse. Three years ago it had not even a park commission, and it is less than two years since the actual work of park construction was begun. Yet it has to-day the substantial framework of a comprehensive park system that is equaled by few cities, if any, of the same size."

This statement is made by John Nolen, who, as the landscape architect of the La Crosse park system, may be expected to speak with authority in the small pamphlet which he issues about the park system of this Wisconsin city. The park commission was appointed, the landscape architect engaged, and a mill tax levied by the city council, which also authorized a bond issue of \$75,000 for the purchase of land and for necessary construction. All this was done within six months, and the plans for the comprehensive system were soon made. Mr. Nolen attributes the success of the movement to reliance upon the public, to the application of efficient business methods in the administration of the park department, and to the making of a complete general plan before any actual step was taken toward its execution. This, he says, "inspired public confidence in every part of the city. Too much emphasis cannot be given to beginning in this way." He observes also that the high character of the commission, which is unpaid and free from political influence, contributed largely to the success of the project.

HEALTH

THE SANITARY CONTROL OF NEW YORK'S MILK SUPPLY¹

ERNST J. LEDERLE

COMMISSIONER OF HEALTH, NEW YORK CITY

It is unnecessary to preface this paper with a discussion of the importance to the public health of thoroughgoing governmental control of the sanitary quality of the milk consumed in large cities. It is widely realized to-day that this is one of the foremost problems of sanitary science, a problem which has increased in difficulty and complexity in direct relation to the growth of modern urban communities and to the expansion of our knowledge of bacteriology and preventive medicine. The simple propositions at the bottom of the municipal milk problem are familiar to all sanitarians. We know that cow's milk, containing all the elements of nutrition, is an ideal food if consumed in a clean state, and, while not a perfect substitute for mother's milk, is the best that we know, if there must be a substitute. But milk is unfortunately a most excellent medium for the growth of all kinds of bacteria. In fact the rise of the milk problem to its present dominating position among the tasks and responsibilities of municipal health officers is only one of the corollaries of the discovery and widespread application of the principles of bacteriology.

The general outlines of the methods adopted by boards of health and other governmental authorities in controlling the sanitary quality of the milk supply of a large city are also fairly well defined and generally accepted. It is recognized that a system of inspection of dairies where the milk is actually produced, supplemented by inspection of creameries and of the methods of shipment and handling all the way from the farmer to the consumer, are necessary elements in this public control. This inspection must provide for the detection of contagious diseases among those handling the milk, as well as the improvement of sanitary conditions. Whether these details are carried out under the supervision of municipal or state authorities is a matter of expediency largely governed by local conditions.

Theoretically it is better that the state authorities should exercise a uniform control over the production and sale of milk in all communities. In practice, some of the large cities, notably New York, have found it necessary, in the absence of thoroughgoing control by the state authorities, to develop their own systems of country milk inspection. This is done in New York by requiring permits from the Board of Health for the sale of milk sold in the city and making free access to farms for inspection a condition of granting the permit. New York now maintains a large force of inspectors who periodically investigate conditions at the farms located in the seven different states from which milk is shipped to the metropolis. The control of the conditions under which milk is handled and sold within the city is a still more usual function of the local authorities and includes the regular inspection of stores and wagons, with frequent chemical and bacteriological tests, and the usual methods of enforcing sanitary requirements by resort to the courts if necessary.

I have thus briefly outlined what may be termed the orthodox methods of insuring the safety of a municipal milk supply, in order the more clearly and emphatically to state my belief that these methods are inadequate to the purpose. My object in this paper will be to show why this is so and what is to be done about it. I shall begin by stating my conclusion.

This subject has been considered with extraordinary care and with unusual facilities for investigation by my associates in the Department of Health, and we have reached the point in New York where we firmly believe, and have officially proclaimed to the public, that the only way absolutely to guarantee the safety of the city's general milk supply is to require pasteurization, under official control, of all except certain grades of high-priced milk. We have, therefore, in the exercise of the complete jurisdiction, both legislative and executive, which the law gives to the Board

¹A paper submitted for the annual meeting of the Medical Society of the State of Pennsylvania, Harrisburg, Penn., September 26-28, 1911.

of Health in matters affecting the health of the city, adopted a sanitary ordinance requiring that after January 1, 1912, all milk except certified milk and certain other special grades must be pasteurized under the rules and regulations of the department. To insure a more scientific application of our system of inspection we have also adopted a plan for the official grading of all the city's milk in three classes:

Grade A. Milk suitable for infant feeding.

Grade B. Milk suitable for adults to drink.

Grade C. Milk for cooking and manufacturing purposes.

The two features, pasteurization and the grading of the milk supply, are closely related in our new milk program, which I believe constitutes the most important advance recently made by any city in the direction of a better supervision of its milk supply. It will be helpful to discuss each of these two elements separately.

Strongly as I have come to believe in pasteurization as a general principle, it is of course true that its necessity varies with local conditions and is particularly called for in great cities because of the enormous extension of the area from which the milk supply is drawn, and the consequent lengthening of the period which must elapse from the time the milk is produced until it is placed before the consumer. A brief consideration of the magnitude of the problem in New York, and of the manner in which attempts at an adequate solution have led to the present conclusion, will indicate certain principles of general application under similar conditions.

The present system of surveillance of New York city's milk supply is, without doubt, more comprehensive and well developed than that of any other great city in the world. Since its beginning, about twenty-five years ago, it has been gradually developed and perfected in accordance with the increase of scientific knowledge and the extension of the facilities at the command of the department.

In a general way, the department undertakes the supervision of the health of persons handling milk, so far as infectious diseases are concerned, on 44,000 farms situated in seven states which ship milk to New York, as well as in 1,100 creameries in the country, in numerous receiving and bottling stations in the city, and in 12,000 stores in greater New York where milk and cream are sold. The department also exercises a supervision over the sanitary conditions all along the line from the farm to the consumer, and makes regular chemical and bacteriological examinations of the milk. In the early days attention was paid only to the physical conditions of watering and skimming. Later the chemical content of milk was standardized and the requirements enforced in this respect. With the development of bacteriology it gradually came to be understood that the bacterial content of milk

at the farm was an accurate scientific index of its cleanliness. Experimental studies in which the research laboratories of the Department of Health played a leading part showed conclusively that the number of bacteria in milk decreased in direct proportion to the care exercised in keeping the barn and cows clean and the milk properly cooled. As a result of this development, the system of milk inspection was greatly extended, until in 1906 inspection of dairies was begun, with five country inspectors. This number has since been increased to thirty-three, and as a result of the work of the department there has been a great improvement in the methods employed in the care of cows and in the collection and handling of milk on the farms where the city's milk is produced. Consequently, the average cleanliness of the milk supply has, without doubt, been considerably improved, and the value of this work, not only on account of its additional safeguards to the health of the city, but because of its contribution to the slow process of education and to the raising of the general standard of milk production throughout the country, cannot be doubted.

This system of surveillance has materially lessened the danger of infection of milk through the presence of cases of infectious disease, such as scarlet fever, typhoid fever, and diphtheria, among the employes on the farms and in the creameries. Within the last two years, however, the progress of preventive medicine and the very development of the closer supervision of the milk supply which has just been outlined have brought to light certain hitherto unknown facts which point unmistakably to the conclusion that, no matter how complete or well organized the system of dairy inspection, it will not be possible to render entirely safe the ordinary commercial milk which is produced and shipped to a city from so large a territory as is comprised in the New York milk shed. It was as a result of careful studies of certain typhoid fever outbreaks, which were suspected to have been caused by milk infection, that several distinct though circumscribed epidemics of this disease were directly traceable to infected milk. The studies themselves were made possible by the development of the present system of country inspection. With the careful comparison and analysis of all possible sources of infection, when an unusual number of cases occurred in one locality in the city, it was found possible to lay the blame upon the milk supplied by a particular dealer and then to follow back the trail of this milk to its sources in the country and thus finally to locate, with all reasonable certainty, the actual origin of the infection. The striking feature of these outbreaks was that they were not found to have originated from cases of active typhoid fever or any other cases of recent development, but were shown to have been due to the infection of the milk through chronic typhoid bacillus carriers, who had suffered from the disease years before and who, at the time, were perfectly well and could not ordinarily

have been considered a source of danger. The investigation had eliminated all other possible sources of typhoid fever contagion and fastened the suspicion upon these individuals. Bacteriological examinations which were then made showed that the intestinal discharges of these persons contained large numbers of typhoid bacilli and that the milk supply contaminated from this source was almost certainly the cause of the outbreak. In one instance it was shown that an extensive outbreak was the result, in all probability, of such infection of milk by a typhoid carrier who had suffered from the disease forty-six years ago and who had during all the intervening years doubtless been a continuous distributor of the disease. No such important outbreak, to our knowledge, has been previously studied and described by municipal health authorities.

The bearing of these investigations upon the theory and practice of the control of the municipal milk supply must be considered as revolutionizing. They show conclusively that no ordinary method of sanitary supervision can exclude infection by disease carriers. In the light of our knowledge of the transmission of disease in this manner, efficient surveillance would require the bacteriological examination of the intestinal discharges of all persons engaged in the milk traffic. This is manifestly impossible. In the case of New York city it would mean the repeated examination of specimens from probably not less than 300,000 persons and would include a systematic examination of every new individual who should become attached to the business of producing and handling milk.

These are the conditions. In my opinion and that of my associates, the only way in which the sanitary authorities can meet them is by requiring pasteurization at least of all milk which is not of special exempted grades. Milk which is intended only for cooking or baking should be pasteurized to avoid the danger of this grade of milk being misused.

On March 23, 1910, Dr. Hermann M. Biggs, general medical officer of the Department of Health, whose standing I do not need to dwell upon before this association, submitted to the Board of Health a convincing presentation of the foregoing facts. The board thereupon adopted a resolution advising that all milk used for drinking purposes be either properly pasteurized or boiled, unless it be of the grades technically known as certified, guaranteed, or inspected milk. By way of bringing this advice home to the people of the city, the department caused notices to be posted in all places where milk was sold, recommending the use of certified, guaranteed, or bottled pasteurized milk for infant feeding and the boiling or home pasteurizing of any other bottled milk or milk from cans. After this policy of warning had been continued nearly a year, the Board of Health decided that the situation called for more drastic action, and on January 31, 1911, a resolution was adopted providing for the compulsory pasteurization, beginning January 1, 1912, of

the entire milk supply of New York city except for milk of the special grades.

At the same time the board adopted the outlines of a plan of classification of the milk sold in the city. This I have long believed to be necessary if we are to combine efficient sanitary control with the maintenance of a reasonable price for milk. I have always been impressed with the necessity of dealing with milk to be consumed by infants as a separate problem. Since the requirements are so much more exacting for milk for infants, and since it has been well established that this grade of milk is much more expensive to produce and should command a higher price than can ordinarily be demanded for milk in general use, it would seem wise to separate the two problems. We enter here into the economic phase of the milk problem, only to find that it is closely bound up with the sanitary problem. Probably the most serious difficulty that has arisen in connection with the development of the close supervision by the city authorities over the production of milk has been that it has not usually been possible for the farmer to realize an extra compensation for his milk, to enable him more easily to bear the cost of the improved plant and additional labor of production. This matter of an increase in the price that a farmer must receive for his milk will become more and more urgent. Some dealers are, of their own accord, paying special prices, but this is by no means the universal practice. One of the principal reasons for the failure of the producer to realize a better price, after improving the sanitary condition of his plant, is the general unwillingness on the part of the public to appreciate this element of value and to pay an additional figure for a better milk. Any general advance in the price of milk, at the present time, however justified by the higher cost of production due to the demands of modern sanitation, would be regarded as the unjust extortion of a combination of dealers formed to raise the price. It is probable that when improvements are more universal and the relation of milk to the public health more generally understood the public will be willing to pay a fair price for wholesome milk, guaranteed to be of good quality. Some progress has already been made in this direction in the introduction of the certified, inspected, and scientifically pasteurized grades of milk, for which a higher price is readily obtained. While these special grades are, in general, safe for consumption, it is apparent that they go only a very little way toward solving the milk problem, since the total of milk of these grades constitutes only a small fraction of the total supply.

Some years ago a careful investigation was made of the different grades of milk sold in New York, from the certified milk of the Milk Commission of the Medical Societies, sold in bottles at from twelve cents to fifteen cents per quart, down to so-called loose milk, retailing at from four cents to seven cents a quart. With the exception of certified milk

and some other special grades, the supply was unsuited for infant feeding on account of high bacterial count; that is, it was not clean. Much of the supply arrived in the city at a temperature above 65 degrees F., and during the summer months would readily sour. The conditions under which it was produced subjected the supply to a more or less constant danger of infection from scarlet fever, diphtheria, tuberculosis, and typhoid fever. It was the pressing problem of infant mortality and the need of better milk for babies which caused most of the agitation and resulted in most of the improvements which have since been made.

A scientific solution of the infants' milk problem demands that the field be divided and our efforts to preserve the purity of the total supply redistributed in a more economical and therefore more efficient manner. It would be an unnecessary waste of effort to attempt to raise the entire supply of 2,000,000 quarts to the standard of milk suitable for infant feeding. Yet the tendency hitherto has been to work on this basis. There is a temptation for the dealer to be unwilling to admit that his so-called market milk is not a fit food for infants when, as a matter of fact, there is not a city in the world whose milk supply is suitable for such a purpose, and it seems very unlikely that it can ever be brought to such a standard. To insist upon such a standard for the entire supply would raise the price of milk to a point prohibitive to the ordinary consumer and would involve much wasted effort. Bacteriological investigation has shown that milk which contains large numbers of the ordinary bacteria of the dust but no pathogenic organisms may yet cause intestinal disturbances among infants, particularly when the resistance of the digestive tract is lowered by hot weather. Yet this same milk may be consumed without danger by persons of mature constitution. Then there is the large fraction of the total daily milk supply which is consumed in cooking and manufacturing. Time and money spent in painstaking inspection of milk destined for this purpose is a waste of valuable effort which should be devoted to babies' milk. It is therefore our problem and our effort to divide the stream of milk flowing each day into New York into branches corresponding to the uses to which each kind is to be put and then devote the appropriate and only the appropriate attention to each branch.

With these conditions in mind, we have provided for the classification in 1912 of all milk sold in the city into three official grades:

Grade A, sold in bottles only, is especially intended for infants and children. Three kinds of milk will be eligible to rank in this grade: (1) certified or guaranteed milk, produced under conditions of the highest cleanliness as controlled by inspections of the County Medical Societies and the Board of Health; (2) raw selected milk drawn from tuberculin-tested herds on farms complying with at least 75 per cent of the regulations of the Depart-

ment of Health regarding sanitary production, and having an average bacterial count of not over 60,000 per cubic centimeter; (3) selected pasteurized milk, which must be obtained from farms complying with at least 60 per cent of the department's requirements and subsequently pasteurized in strict accordance with the regulations of the department. These regulations prescribe the duration of the exposure to heat, the temperatures to which the milk must be subjected, and the manner in which it must be handled before the term "pasteurized" may be used with official sanction. For the purpose of grade A milk of this class the average bacterial count of milk must not be over 50,000 per c. c. when sold.

Grade B will be regarded as suitable and safe for adults to use as a beverage. It will include the following classes: (1) all milk complying with the provisions required by the department for grade A; (2) raw milk complying with the requirements for selected milk in grade A, but substituting a physical test of cattle for the tuberculin test; (3) milk which has been properly pasteurized under the department's regulations. Milk of grade B must be delivered in bottles or drawn from proper containers, but not dipped from cans or other open receptacles.

Grade C will include all other milk, not classified in grades A or B. The use of milk of the third grade will be restricted to cooking and manufacturing. Purely as an administrative measure, it will probably be necessary to insist upon the pasteurization of this milk for some time to come, since we have not a sufficiently large force of inspectors to insure that the milk intended to be used in this class would really be so used.

There are many important aspects of the milk problem and of the particular requirements which we are trying to bring about in New York by these new measures which I have had no opportunity even to touch upon in this paper. Within the limits of the discussion, I have felt obliged to confine myself to a statement of the main outlines of our problem and of the reasons for and the significance of the radical steps we are about to take. I believe that medical and sanitary authorities in general are coming to believe as we do in the necessity for the wider use of pasteurization in protecting the milk supply of large cities, and that the experience of New York in this respect is full of significance for other communities which receive and consume milk under similar conditions. The proper grading of the milk supply has appealed to me for many years as one of the most important factors in the solution of this problem; and with a special grade of infants' milk, officially established by the Board of Health and sold for such at a reasonable price, I firmly believe that a great advance will have been made in that splendid campaign for the reduction of infant mortality which is now receiving the earnest attention of sanitary authorities all over the world.

EXAMINATION OF EMPLOYEES FOR TUBERCULOSIS

THEODORE B. SACHS, M. D.
Chicago Tuberculosis Institute

Periodic examination of machinery is a part of the business policy of all well managed establishments. Serious damage or even total destruction results from neglect to make timely repair. Entailment of a small expense to-day means prevention of a larger expense or possibly of total loss to-morrow. The policy of periodic examination, intended to stop leaks, to repair slight damage, to prevent irreparable deterioration, is applicable at present to all "inanimate" machinery. "Human" machinery is just beginning to receive the gradually increasing proportion of attention due to it.

It is readily understood that knowledge of the physical condition of a worker is of great importance to the employer, as health is a factor in determining productive efficiency. The period of usefulness of employes is lengthened through a system of examinations designed for detection of breaks in their physical condition and a policy of extension of leaves of absence at a time when "repair" is possible. It is in the interest of every business man to take stock of the health of his employes, if for no other reason than for the determination of their working capacity and prevention of total disability, which results in the loss of tried and experienced men.

In the detection of no other disease does the economic gain to the employer from this procedure stand out as prominently as in pulmonary tuberculosis, with its gradual and at first imperceptible impairment of the productive capacity of the worker. The early detection of this disease in an employe is of great importance to himself, his co-workers, and his employer. The chance of ultimate "cure" or "arrest" as well as restoration of the working capacity gradually diminishes with the growth of the disease. The possibility of infecting others grows with the gradual transformation of a "closed" incipient lesion into an "open" tuberculosis, with its swarm of tubercle bacilli in the sputum. The interests of the employer are alike vitally affected by the gradual diminution of the productive capacity of a tuberculous employe and of those subsequently infected.

These considerations call for a system of medical examinations of employes in all working places as a measure of great importance to all concerned, the expense entailed in the maintenance of such examinations being far outbalanced by the benefits derived. It is highly desirable that all employes should be examined for traces of tuberculosis, and it is possible that with the present tendencies in our system of government the state may eventually make provision for this purpose. Until then, however, the interests of the employer necessitate the conduct of such examinations at his own expense.

To test every applicant for position for traces of tuberculosis would entail a considerable outlay of money, though in a number of manufacturing and commercial establishments a large percentage of employes are at present given a thorough medical examination before their admission to benevolent associations connected with their working places. In Chicago, numerous firms provide general medical service for attendance on employes falling sick during their term of employment. Special attention is given to tuberculosis in the shops of Sears Roebuck and Company, Montgomery Ward and Company, and the International Harvester Company, three firms well known for their welfare work among employes. Each of these firms has built and maintains a special cottage for its employes at the Edward Sanatorium, Naperville, Illinois.

The great prevalence of tuberculosis among working people makes desirable, however, special medical provision in large establishments for early detection of this disease. To round up every possible case of tuberculosis, without going to the extent of examination of every employe, the following method was proposed to the International Harvester Company, which employs about 20,000 workers in the city of Chicago.

A list of suspected cases is prepared by a special tuberculosis nurse who has the cooperation of the foremen in charge of various factories of the company. The list includes the following groups of cases:

First: Employes in whom the diagnosis of tuberculosis has previously been made;

Second: Employes in whom poor general condition in connection with other suspicious symptoms suggests the presence of the disease;

Third: Employes with histories of protracted cough and expectoration;

Fourth: Employes in whose families a case of tuberculosis exists or death from this disease has occurred.

With the compilation of the list of suspected cases, a special tuberculosis clinic is to be inaugurated for the benefit of the employes of the company. This plan was first submitted to the Executive Committee of the Chicago Tuberculosis Institute and on their approval adopted by the International Harvester Company. Doctor James A. Britton of this city and Miss Jane Flanagan, a tuberculosis nurse until recently on the staff of the Chicago Municipal Sanitarium, were placed by the International Harvester Company in charge of the proposed clinic. Beginning with the above mentioned groups of cases the system of examination for tuberculosis is to extend gradually to all suspicious cases.

With the inauguration of this first industrial tuberculosis clinic, the Chicago Tuberculosis Institute appointed a special Advisory Committee on Factories, consisting of Dr. Henry B. Favill, Mr. Sherman C. Kingsley, and Dr. Theodore B. Sachs. This committee

is to act in advisory relation to the clinic and has for its purpose the extension of similar provisions to other manufacturing and commercial establishments.

It is agreed that a case of tuberculosis in a working place should not remain unrecognized and uncontrolled. Knowledge of the actual conditions in reference to tuberculosis among their own workers is bound to enlist the active participation of employers of labor in the present great crusade against the white plague, and is destined to improve the entire situation.

DENTISTRY IN STATE INSTITUTIONS

ALICE WALRATH

The dentists are not to be outdone by the physicians and other professional men. The broad-minded dentist is devoting his time not only to those who seek him in his office, but also to scores and scores of his less fortunate fellow-beings. A few months ago the New York State Dental Society took upon itself to ascertain the dental conditions existing in the state charitable and penal institutions, and a committee of three, under the chairmanship of Dr. L. A. Timmerman, Fort Plain, was appointed to investigate the matter. Twenty-five institutions were consulted, the committee asking whether the institution had a staff dentist; how he was appointed; how much time he gave; what his compensation was; the class of dental work done; what equipment was furnished by the state; what percentage of inmates were able to pay for dental work, etc.

Replies to these questions, especially from the larger institutions, entered into details and contained suggestions showing careful thought. It was found that of these twenty-five institutions only eight had dentists on their staffs, and that there was no uniformity in the method of their appointment. Sometimes they were appointed by the superintendent of the institution, sometimes by a board of managers, while in three instances convicts were taken for the purpose. For the approximate 19,000 individuals in the twenty-five institutions it was estimated that less work was performed than five dentists would accomplish working eight hours a day and twenty-five days a month—that for an average of 3800 inmates there was only one dentist employed. For this service the state does not pay more than \$250 per month, and the class of work done consists principally of extracting, plastic filling, and cleaning. In a few institutions plate work is included, while if the inmate has a credit balance and is willing to pay for them he may have gold fillings and crown and bridge work.

The answers showed that the state provides a fully equipped dental office in only five of the institutions, while in twelve chairs and foot-engines are provided. Several have nothing more than extracting forceps. In reply to the question regarding the percentage of inmates able to pay for dental work, the answers varied greatly. On the whole, however,

it was found that but very few could afford it, as the great majority are without any financial resources whatever. Three of the institutions made no reply regarding the necessity of dental work, while the remaining twenty-two thought it a decided advantage.

The recommendations offered were interesting. One advocated the free services of dentists, while a few declared that they were satisfied with present conditions. Dr. William L. Russell, former superintendent of the Long Island State Hospital, and medical inspector for the State Commission in Lunacy, wrote: "A resident dentist should be employed in every state hospital in the state, and he should give his whole time to the work."

In his report to the State Commission in Lunacy, Dr. Russell said:

"The amount of dental work done is, however, I believe, less than it should be. The gums and teeth of the patients are frequently in bad condition, and the attention required to put them in good shape is very great. In some of the hospitals it is difficult to secure the services of a competent dentist, and at best the time for which he is engaged is too short for what is needed. In the largest hospitals there would no doubt be constant work for a resident dentist, who might be a salaried officer. At the other hospitals a salaried dentist might be employed who could attend to the work of two or more. The results in the improved health and comfort of the patients, and in the sanitary conditions, would more than repay the expense involved."

It is evident that much remains to be done in order to secure the comfort and improvement of those who inhabit these institutions. Is it not the duty of the state to give more serious thought to the welfare of these individuals? The inquiry made by the committee has certainly been of use in directing attention to this subject, and it is to be hoped that ere long the state will take decided measures to improve the dental conditions existing in its charitable and penal institutions.

JOTTINGS

A SANITARY UNIVERSITY

In an editorial headed, Wanted: A Sanitary University and a National Board of Health, *Domestic Engineering* points out our complete lack of provision for expert training for health officers and urges the need for facilities in the proposed federal department of health, which should be above all "a source of sanitary thinking, a directive agency of sanitary effort, a controller of sanitary activities. . . . At the present time the majority of our health boards are in the hands of bakers, tinkers, and candlestick-makers" and most of the sanitary officers "acquire their knowledge of sanitation after they get the job." In England the Royal Sanitary Institute has demonstrated its usefulness by setting the standard for sanitation and turning out experts, and the organized effort of plumbing and sanitary engineers in this country should be directed to-

ward obtaining a section in the bill for a federal department of health providing for a like national institution in this country.

PROSECUTIONS FOR SAFER FOOD

A vigorous campaign to improve the quality of the city's food supply has been started by the Health Department of the city of New York. On one of their most active days within the last fortnight thirty-three persons accused by the health inspectors of purveying unwholesome foods or drugs were arraigned in the Court of Special Sessions; nineteen of these defendants were found guilty, and assessed fines ranging from \$10 to \$500; of the others, two were found guilty and sentence suspended; ten cases were adjourned; one was discharged on a technicality, and one person was acquitted. Most of the convictions were for violations of the section in the sanitary code which forbids the sale or offering for sale of any meats, fish, eggs, birds, fowl, fruit, vegetables, or milk not sound, wholesome, and safe for human food. One conviction, carrying the inadequate fine of \$100, was obtained on the charge of selling "white whiskey" which contained about 40 per cent of wood alcohol.

FOOD FOR TUBERCULOSIS PATIENTS

Many traditions with regard to feeding tuberculosis patients and to food in general are given severe blows in a series of articles in the October number of the *Journal of Outdoor Life*. Dr. John R. Murlin, of the Cornell University Medical College, holds "that a consumptive will gain weight and do well on three pints of whole milk, eight ounces of cream, five ounces of milk sugar, six eggs, and two slices of buttered toast, as a ration for each twenty-

four hours. The entire diet with the exception of the bread and butter could be prepared in advance and served for a cost of about fifty cents per day. Dr. Murlin compares food to fuel in furnishing power for an engine. In selecting food we should eat enough to furnish energy for the day's work, but much more than this is not needed. He holds that the appetite is not a necessity for good digestion. "There is no fallacy of nutrition," he says, "greater than that which supposes that a food cannot be digested and utilized without appetite." Most of the food we eat, fully four-fifths, goes to supply energy for our everyday tasks, while less than one-fifth goes for building material.

Dr. David R. Lyman and Dr. Paul B. Johnson both agree that the ordinary person eats too much, and that the old notions about stuffing a tuberculosis patient at all times and seasons have been proved false. Dr. Lyman holds that eggs are not a necessary article of the consumptive's diet, and that a tuberculosis patient should eat anything that agrees with him, and that is nourishing. He thinks that a tuberculosis patient should eat only a little more than a person in ordinary good health.

Miss Cecilia Flick of the Henry Phipps Institute of Philadelphia also offers some sample diets which the ordinary family can prepare for even less than fifty cents a day.

GUIDE FOR HEALTH-SEEKERS

Health-seeker's Guide to the Southwest is the title of a booklet published by the Excelsior Publishing Company of Menrovia, Cal. The book is a directory for the health-seeker of the various advantages, climatic, economic, and otherwise, of the principal resorts of Colorado, Texas, New Mexico, Arizona, and California. The information is arranged by cities. Under each city is a brief description of the place, followed by a discussion of the prevailing temperature, winds, etc. The prices of board and rent, and also of the most common necessities, such as coal, meat, vegetables, etc., are given. Under each city are listed the principal sanatoria in that locality. The transportation facilities are also noted.

TRAINING SCHOOL FOR CONSUMPTIVES

A new department in connection with Hohenlychen, the famous sanatorium for children at Berlin, was opened on June 22 by the German empress. It is known as the Training School for girls, and is for the purpose of giving girls of fourteen years of age, who have reached the convalescent stage, a chance to learn some practical trade, such as needlework or hand-embroidery. The school is under direction of A. L. Bernheimer. A training school for boys on similar lines has been put into operation under the same roof. Mr. Bernheimer has just published in English an illustrated pamphlet, describing the work at Hohenlychen, which will be sent to anyone applying for it.

INDUSTRY

THE LABOR PRESS.

Reproduction of banner put together by the Department of Church and Labor of the Presbyterian church. The title pages of 161 papers and periodicals, published by the various labor organizations, appear in the original, which is nine feet square.

SOME METHODS IN SAFETY ENGINEERING¹

1—GUARDING TRANSMISSION MACHINERY

JOHN CALDER

GENERAL MANAGER REMINGTON TYPEWRITER WORKS, ILION, NEW YORK.

Though our industrial life is characterized by a steady extension of the factory system of production and an increased division of labor using mechanical aids, the accident list need not increase *pro rata*. The absence of safeguards, though not the most prolific cause of accidents in plants, closely concerns the mechanical engineer, who holds the possibilities

¹The first of three articles compiled from a paper presented by Mr. Calder before the American Society of Mechanical Engineers and printed in full in its *Journal*. The two succeeding articles deal with the dangers most frequently met with at the operating point.

largely in his own hands. In the eyes of the public and non-technical investigators it is of first importance. The safeguarding of some especially dangerous machines and processes is of course to some extent evolutionary; but some degree of finality is attainable in the simpler forms of safeguards about power-houses, transmission machinery, and dangerous details common to all machines, and most failures to prevent accidents from these are due to lack of consistency and thoroughness in applying the recognized remedies.

1 — Transmission Tube and Disc.

2 — Permanent Low Overhead Guarding.

3 — Detachable Low Overhead Guarding.

4 — Screen Belt-Guards.

5 — Rail Belt-Guards.

6 — Box Shaft-Guard.

Safeguards, where at all possible, should be constructed of metal to secure durability. Reinforced steel mesh-work is preferred by the author for all but the heaviest machinery. It is superior to guards of opaque material, since it permits easy inspection without detaching the safeguard and interferes as little as possible with lighting conditions. In steel mills, foundries, and heavy work plants of various descriptions, where the wear and tear of equipment is very great, nothing but strong castings or steel plate work should be used for the majority of the guards. It is the practice of the author to have all safeguards readily distinguished by painting the body of them vermilion and the reinforced edges black. This allows executives to detect at a glance in going through the shops a displaced or defective guard, such parts being often small in area, in inconspicuous places, and liable to be overlooked.

In many cases of injuries to operatives caused by the absence of a possible safeguard, it will be found that it has been removed or rendered ineffective by the employe for lack

of supervision in such matters, or that protection has never been provided. Safeguarding absent at one machine is sometimes actually afforded elsewhere under the same roof, and the accident is due to the operation of the principle that what is permitted to be everybody's or anybody's business is in daily life nobody's business. The safety engineering of no plant should be left to the haphazard initiative of a number of individuals.

Omitting details of the guarding of prime movers, the safety of the connecting links between the power-house or the shop motors and the individual machine tools and apparatus naturally calls first for the mechanical engineer's attention. Transmission machinery, whatever its situation in relation to the floor level, has its accident risk conditioned by the necessity of any workman's having to touch or approach it, while in motion, in the course of his duties.

The extensive use of multiplied motor drives, properly screened or at a safe elevation, has done away with many transmission belts, shafts, pulleys, collars, and couplings in

7—Safe and Unsafe Idle Belts.

8—Belt Perch.

9—Belt Shipping Pole.

10—Safe and Unsafe Transmission Details; Couplings, Collars, and Set Screws.

dangerous proximity to males and females at work in all of our more modern plants. The managers and mechanical engineers of many industries, however, have still to reckon daily with the accident risks of the older type of buildings and transmission arrangements; and the latter when not safeguarded are sometimes the cause of horrible fatalities and ought to be closely scrutinized in every detail.

Metal tube and disc guards for shafting, bearings, and pulleys requiring to be approached closely while in motion are shown in Fig. 1, while forms of protection for transmission in old plants with insufficient headroom are shown in Figs 2 and 3. Seven feet clear of every moving part is considered the least height from the floor level without guarding, and even then, where a horizontal belt drives across a frequented passage at this minimum elevation, it is well to have the lower side screened close to the belt to avoid injuries caused by "whipping" when the belt breaks.

Figs. 4, 5, and 6 show guards for belts and shafting driving through floors or at floor levels. Desirable and undesirable forms, respectively, of the shaft couplings, collars, and set-screws of transmission apparatus are

shown in Fig. 10, while in Fig 7 are illustrated the safe and unsafe positions for idle belts which sometimes depend from shafts and cause numerous accidents. Fig. 7 also shows the manner in which an unshipped belt, allowed to travel on the shaft, seizes the shaft by its own friction, aided possibly at times by engendered electrification. The slack side *a* by contact with the tight side *b* is carried into the bight *c* and the shaft rolls up the two sides together, usually breaking the belt, but in some cases of very light countershafting dislodging the latter and injuring the operatives beneath.

The use of the belt perch, Fig. 8, of which there are several forms, prevents the traveling of the belt when unshipped, and accident therefrom, and obviates its unnecessary wear and its possible destruction when falling into the narrow gap between a pulley and a bearing. Fig. 9 shows one of several forms of belt replacement pole which does away with any close approach by the machine operator. Special care should be taken by the designers to see that all belt shifting and machine starting and stopping gears are positive in their action. Many accidents have occurred at machines through inefficient or defective fast and loose pulley and belt arrangements suddenly starting a tool which was under examination or adjustment.

BEGINNINGS OF CHILD LABOR LEGISLATION¹

SOPHONISBA P. BRECKINRIDGE

In the comparative study of child labor legislation made by Dr. Otey for the Federal Bureau of Labor is found an important addition to the mass of evidence already at hand pointing to the fact that the problems of child-caring confronting the community today are problems of formulating and applying new standards, not problems of meeting essentially new conditions. The industrial revolution has changed the background against which the tragedy of child neglect takes its course; the factory light throws a more lurid glare upon wan and unchildlike faces; parental ignorance and selfishness find new scenes of activity; the question is complicated by the confusion with regard to the importance of temporary prosperity of an industry depending upon the labor of children as compared with the permanent well-being of the community. The essential factors, however, remain the same as in earlier periods of industrial life; and, in this careful and thorough presentation, the most striking fact which emerges is this: that the desire of parents to use their children to their own advantage has proven well-nigh as serious an obstacle in the way of intelligent child-caring as has the employer's unwillingness to be interfered with when his profits seem to result from infant toil.

The discussion covers the following topics:

1, The Employment of Children in the Colonies, Chapter I, where, as has formerly been shown by Edith Abbott,² the use of child labor was encouraged and advocated as preventive of idleness, vagabondage, and pauperism.

2, Public Opinion and Child Labor in the Nineteenth Century, under which is described the transformation of the belief that child labor is "righteous and beneficent" into the conviction that it is unrighteous and socially harmful.

3, An Historical Sketch of Children in relation to the cotton industry;

4, A Review of Child Labor Legislation, prior to 1860, in Massachusetts, Rhode Island, Connecticut, Vermont, New Hampshire, Maine, New York, New Jersey, Pennsylvania, Delaware, Maryland, and Ohio.

¹THE BEGINNINGS OF CHILD LABOR LEGISLATION IN CERTAIN STATES; A COMPARATIVE STUDY. Report on Condition of Women and Child Wage-Earners in the United States, in 19 Volumes, Vol. VI, 61st Congress, 2d Session, Senate Document No. 645. Prepared under the direction of Charles P. Neill. By Elizabeth Lewis Otey, Ph.D.

²WOMEN IN INDUSTRY, Appendix A.

5, The Child Labor Legislation in four selected Southern States, North and South Carolina, Georgia, and Alabama.

An interesting fact which emerges very clearly from this discussion is that in the movement in behalf of public education was found the first protective agency for the children of the poor and of the unintelligent and selfish. The public school may not have accomplished all that was expected; but the claim it has made for all children, the objections raised by it to demands upon the time and strength of children inconsistent with its own demands, have at times been almost the only appeal uttered against child exploitation. The "first murmur against the factory system for children arose not from consideration of their health, but from the interest in education, and indeed it was to be expected that the public school movement would not omit the factory children". (page 30)

The first official reference to the subject is found in 1818 in the governor's message in Rhode Island, where the evils of child factory labor were probably the greatest. In Massachusetts the first official investigation was made in 1825, and was an investigation, not into the evils of child labor, but "into the expediency of providing by day for the education of children employed in factories." The hours of work were "generally twelve or thirteen hours each day," leaving "little opportunity for daily instruction"; and in 1836 an act was secured in that state providing that no child under fifteen should labor in any manufacturing establishment unless it had attended school at least three months in the year, which resulted in 400 children in one manufacturing town who had never been to school being entered on the school rolls (page 76).

While it is impossible to review at length the legislation in the various states, it is most interesting to notice five aspects of the movement. The first is that already referred to, namely, the conspicuous place held by education in the effort to protect working children. This is true, however, only in the northern states. By the time such legislation was regarded as necessary in the South, the right of all children to childhood rather than the right of the state to an educated citizenship had been clearly enunciated and the claim for such protection therefore firmly established on that basis. The second is the relation of the child labor movement to be the general la-

bor movement, when it becomes apparent that the effort is rather to protect a laborer who happens to be a child than a recognition of the right to childhood; the third, the connection between the movement in behalf of children and that in behalf of women; the fourth, the persistent and universal opposition on the part of the employers of child workers, among whom those who have been responsible for the conduct of the cotton industry have been conspicuous; and the fifth, the early recognition of the ever present fact of parental ignorance and greed as a hindrance in the path of the reform, especially as an obstacle to the enforcement of such legislation as has been secured. Of special interest, of course, is the discussion of the efforts recently made in the southern states to secure protective legislation. How recent the movement is in the South and how weak it has been is illustrated by the fact that at a hearing in 1905 before a committee of the North Carolina Legislature, when it was proposed to forbid the employment of boys under twelve and girls under fourteen in factories, to prohibit night work for all children under fourteen, and to require boys under fourteen to be able to read and write, retaining the sixty-six hour week for those who were allowed to work, "only the southern secretary of the National Child Labor Committee . . . spoke for the bill," and the bill was the occasion of "a storm of protest." The law of that state still provides no means of enforcing the terms of the law, accepts the written statement of the parent as to the age of the children, and allows children between thirteen and eighteen years of age to work sixty-six hours a week at night, if the interest of the industry seems to demand it. South Carolina and Georgia, which prohibit the work of children under twelve in factories (mines and textile manufacturing in South Carolina), recognize as exceptions orphans, the children of widows, or of totally disabled parents—exceptions which are shown in Volume I of these federal studies to render the whole law in many cases nugatory, because in neither state is there anything like adequate inspection.

The comparison in tabular form of the legislation in the northern states prior to 1860 and the present legislation in the four selected southern states is extremely interesting. Massachusetts in 1860 prohibited the employment of children under twelve for

more than ten hours a day in manufacturing establishments, no inspection being provided. North Carolina in 1907 prohibited the work of children under thirteen in manufacturing, but provides no inspection, and permits children over thirteen to work sixty-six hours in a week by night if desired. It is encouraging, however, that such legislation as has been secured in North Carolina and the other southern states is urged and obtained in recognition of the claims of all children to freedom from excessive toil, and while the "widowed mother" feature still prevails, it may be that the revelations of conditions prevailing in these states will suffice to secure substantial protection in terms made real by effective factory inspection. The present volume is a most valuable addition to those in which the present conditions of women and child wage-earners are set forth.

FACTS WHICH CALL FOR ACTION

MARY BROWN SUMNER

The report on the first semi-annual reinspection of all the shops in the cloak, suit, and skirt industry which was made by the Joint Board of Sanitary Control in August finds the "cloak shops far from perfect, but as good as, and indeed better than, in other industries." As the report does not separate the re-inspected from the new shops, it is impossible to judge of improved conditions in the former group. The fear expressed by many that the standard set by the board would drive the industry out of the city appears to have been unfounded, as the inspectors found 1,738 shops as against 1,243 at the time of their original inspection last February, and these shops employed 45,199 persons as against 36,941, which gives about the same average number of persons to a shop.

Of these 45,199 persons the vast majority were found to be working in loft shops and of these more than half were above the sixth floor, sixty or more feet above the sidewalk. In these and all the 1,414 loft shops investigated, without exception, the following dangerous conditions were found: floors were divided and subdivided into many sections by flimsy wooden partitions; quantities of woolen and cotton goods as well as stacks of pine packing-boxes littered the floors and other parts of the shops. These are the fire dangers common to all loft shops. In respect to other fire dangers, sixty-three out of the total number of shops had no fire-escapes; 236 were imperfectly equipped with drop-ladders; 150 had obstructed escapes; twenty-five had locked doors; twelve had unsafe stair treads. On the side of preventive measures, only 359 had doors opening out; 128 had automatic sprin-

¹See THE SURVEY, May 6, 1911.

klers; and 135 chemical extinguishers; only fifteen had fire drill. The figures for the 1,243 shops investigated in February¹ show fourteen with no fire-escapes, 101 imperfectly equipped with drop-ladders, seventy-eight with obstructed escapes, twenty-three with locked doors.

At that time but seventy had doors opening out and but one had fire drill. A comparison of the two sets of figures shows some slight apparent improvement in respect to drill, doors opening out and doors left unlocked; no improvement whatever, in some respects, indeed, larger numbers with bad conditions, in respect to the other fire dangers.

Under the heading sanitary care and comforts the report shows that though lunches were eaten in 1,171 shops, few had any provision for this practice. Forty-three had no wash-basins and 285 no receptacles for rubbish, and 568 had defects in cleanliness in the workrooms. One thousand five hundred and twenty-nine had defects in water-closets, covering lack of cleanliness, lack of proper separation between men and women, and insufficient, in some cases accommodation to meet the needs. As far as these figures can be compared with those of February, they show perhaps slightly better conditions in respect to "cleaning-up," but no better conditions where structural changes are required.

The figures in regard to illumination and ventilation in the two investigations are presented in forms that are not comparable. The August report shows 1,086 shops illuminated by gas, 294 requiring artificial light all day. Six hundred and fifty-eight shops—over one-third, that is—are heated by stoves alone. In respect to ventilation the figures of shops badly ventilated are not given, but the report says:

"The testimony of our inspectors is unanimous to the fact that the air and heat in the shops during the last days in August, when the inspections were made, are unbearable, and that there was plenty of evidence of intense suffering on the part of the workers from insufficient air and from heat. With electric power in 1,308 shops, there is really no reason why some sort of ventilating devices should not be installed by the employers if they really wish for the welfare and efficiency of the workers."

Two paragraphs in the report are illuminating as to the intention of the Joint Sanitary Board with respect to getting action in the next six months which will make a more satisfactory showing at the next inspection. After enumerating a list of fire hazards which in their belief employers and owners of buildings could readily remedy, the report declares:

"There cannot be any excuse for the above enumerated defects. These defects can, may, and must be remedied. They will be remedied if the Joint Board of Sanitary Control continues to have the support it enjoys from the employers and from the workers. . . .

"Among the 1,738 shops inspected, twenty-

one were found to be located in cellars. A list of these has been given to the union, with positive orders to remove their men from these shops, which are dangerous to health."

INDUSTRIAL EDUCATION CONVENTION

The National Society for the Promotion of Industrial Education will hold its fifth annual meeting at Cincinnati, Ohio, November 2-4. One complete session of the convention will be devoted to consideration of the industrial training given in the schools of Cincinnati. This city has been a pioneer in the United States in developing co-operative plans. Dean Herman Schneider, of the College of Engineering, University of Cincinnati, is well known in this country as the originator, in 1906, of a part-time arrangement whereby regularly indentured apprentices in the shops of the city are enabled to take courses in the university designed to increase their effective understanding of work done in the shops. Other examples of co-operative industrial training are to be found in the high school and the continuation school maintained by the Board of Education of the city. The Ohio Mechanics Institute of Cincinnati, of which John L. Shearer is president, will open a new building before the date of the convention.

DEATH-PROOF, NOT FIRE-PROOF FACTORIES

The *Cement Age and Concrete Engineering* comes out for death-proof as opposed to fire-proof factory construction. "A furnace," says a recent editorial, "is fire-proof, and some of our most fire-proof buildings, when filled with combustible material and having large areas for a free sweep of the flame, and elevator and stairway shafts to furnish the drafts and vent, become most effective furnaces." A good design that allows of easy exit is the essential. Doors opening outward and made of an incombustible material, as well as the breaking up of large areas, that spread flame, into small areas separated by reinforced concrete partitions are suggested.

UNION LABEL CAMPAIGN IN NEW YORK

The labor unions of Greater New York have organized a local campaign to extend the union label. A central union label council has been formed, made up of representatives of all organizations having any form of label to designate their products. Under this council assembly district councils are to be organized, whose members are to carry on a systematic campaign of education among the working population of their districts. Part of the work will be done by personal appeals to individuals and part by illustrated public lectures. For the latter purpose the council asks the co-operation of any church or society willing to place a lecture hall at its disposal during the campaign, which will begin with the early fall. Peter T. Brady, 63 Park Row, is chairman of the council; Elizabeth Dulther, Women's Trade Union League, 43 East 22d street, is secretary.

CRIME AND ITS CURE

ISABEL C. BARROWS, Contributing Editor

THE CRIMINAL INSANE

OSCAR LEONARD

Though it became clear in England quite early in the eighteenth century that the insane criminal can not be placed on a par with the sane offender, special provisions for the demented criminal have been slow in coming. In fact, any article on the subject of what is being done in the way of special provisions for the insane criminal must deal rather with what is *not* being done in the various states of the union. Special provisions cost money, which must be obtained from the public. The public will not loosen the purse-strings until it is made to understand the need of such provisions. Unfortunately, in most of our states, the public is not aware of the needs of the criminal insane.

About a decade after the birth of the United States, England opened insane asylums for demented criminals. A little later Ireland and Scotland did the same. Almost a century later New York established the first institution in the United States for the criminal insane. Three years afterwards this example was followed in Canada. Ferri says that there is not one separate institution for the criminal insane in continental Europe today. In most cases the insane criminal is placed in a special ward connected with the prison. Occasionally such criminals are sent to insane asylums.

In the United States insane criminals are sometimes sent to insane asylums. Often they are sent to poor-farms! In connection with some penal institutions there are separate wards for the insane, generally known as the "dippy room." Connecticut consigns insane criminals to the state insane asylum "for such time as the court may direct." Dakota suspends judgment in case of the insane until he becomes sane. But the court has a right to commit such a criminal to the care of the sheriff if the safety of the community demands. Delaware allows the court to commit persons acquitted of crime on a plea of insanity to an almshouse or an insane asylum. The Court of General Sessions may order such a person released. Florida either commits such persons to jail, gives them to the care of friends if the latter give sufficient se-

curity, or sends them to an insane asylum. Missouri sends her demented criminals to insane asylums. For those who are deemed less dangerous and those who become slightly deranged while in prison, a "dippy room" is provided in the state penitentiary. New Hampshire commits those who plead insanity either to an asylum or to prison. New Jersey has no statute dealing with the criminal insane. In North Dakota "morbid propensity to commit prohibited acts" does not always form a defense for such acts. Where the defense of insanity is recognized the person may be sent to the state insane hospital. Wyoming disposes of insane criminals by giving them treatment "prescribed by the state board of charities."

The several manners of disposing of the insane criminal given here are quoted from the Proceedings of the National Prison Association for 1907. Certain states were singled out simply because the various methods employed in them illustrate the subject under consideration. As we have seen, the insane criminal may be sent to an ordinary insane asylum, the poor-house, the jail, placed in care of sheriffs, or assigned to "dippy rooms." Fortunately there are some states which care for the criminal insane in a modern up-to-date fashion. These states should serve as examples for their sister states.

Among the commonwealths that have special provisions for the criminal insane are New York, Massachusetts, Illinois, and Michigan. Pennsylvania and Ohio are now erecting suitable institutions for the insane criminal. New York is the pioneer, having opened its first hospital in 1859. That state has now two such hospitals. Matteawan cares for unconvicted cases sent there by courts. Dannemora looks after the convicted insane. The New York institutions are probably the most up-to-date, serving as a standard for similar institutions throughout the country. Massachusetts has made special provisions for this class of criminals since the early sixties. Michigan's institution for the criminal insane at Ionia dates back to 1883.

Dr. Robert W. Lambert, late medical superintendent of the New York State Hospital, in an article in *Penal and Reformatory Institutions*, edited by Professor Henderson, summarizes the classes of persons sent to such institutions as follows:

Persons who become insane while serving sentence.

Persons accused of crime and found insane previous to or after indictment.

Persons acquitted of crime on the ground of insanity.

Persons of previous criminal tendencies, adjudged lunatics under civil process.

Persons of homicidal tendencies resident in civil hospitals.

Persons who are adjudged lunatics while serving sentence and who are unrecovered on completion of such sentence.

Special institutions for such classes are absolutely needed in every state; for to send criminal insane to regular insane asylums is absurd, unjust, and mischievous. It is surely unjust to the non-criminal insane, as they have a right to be treated as sane respectable citizens would be. The insane asylum should not serve as a dumping ground, any more than an ordinary hospital should. It is mischievous because all kinds of sexual perversions are often part of criminal insanity. Such practices are easily passed on to those who would never know of them were it not for contact with criminal insane. Nor can the criminal insane receive the special treatment needed by them without special institutions. To send the criminal insane to the poor-farm is perhaps still worse than sending them to the ordinary insane asylum. To place them in the care of a sheriff does not solve any problem either for society or for the criminal insane.

In order to be truly helpful to the insane criminal and to do its full duty society should provide special institutions for them. These unfortunates need special care if they are to be nursed back to health and useful citizenship. If the convict becomes insane as a result of his new environment it is evident that he must be removed from prison environment and be placed in an institution. Melancholia, which according to Dr. O. R. Long (*Proceedings N. C. C. C.*, 1896, F. N.), is a rather common form of insanity among first offenders, surely can not be cured by any of antiquated methods prevalent in most of our states. Then, too, society has a certain responsibility toward these offenders. They enter the penal

institutions sane. They are imprisoned as a result of violating rules laid down by society. Society has taken it upon itself to inflict punishment. But it has no right whatsoever to drive them insane. If confining them in prisons brings on insanity, society must nurse them back to a normal state. But this can never be done by means of the "dippy room" or poor-house or sheriff's care.

Ferri in his *Criminal Sociology* favors two kinds of asylums for the criminal insane, in which discipline should differ. He believes there should be an institution for those who commit "serious and dangerous crimes, such as homicide, incendiarism, rape, and the like; and the other for slighter crimes, such as petty theft, violent language, outrages on public decency, and the like. For the latter the seclusion should be shorter than for the others."

H. M. Boies proposes in his *Science of Penology* a type of institution on "the general plan of hospitals for the insane, with prison security in addition." He says they ought to be distinct from the ordinary hospital for the insane as well as from prisons. At the head should be placed an alienist rather than an ordinary warden who perhaps owes his job to political influence.

Dr. Lamb gives the following five requisites for a successful separate institution for the class under consideration:

Buildings on the pavilion plan of hospital construction with from 10 to 15 per cent of single rooms, the balance being dormitories and day rooms.

Buildings to be separate and apart from any other institution and suitable for securing custody, and to have farm lands available for employment.

Administration to be wholly medical in its organization.

Entire cost of maintenance to be borne by the entire commonwealth and not by municipalities or counties.

The general standard of maintenance to be practically as among the civil insane of the same community, with all the liberties possible under a positive custody.

Dr. T. C. Fitzsimmons (*Proceedings N. C. C. C.* 1909, F. N.) makes some valuable suggestions with regard to the site best suited for an institution for the insane criminal. He lays stress on natural pure water, attractive scenery surrounding the institute, and porches with southern exposure.

The many states still without special institutions would do well to study carefully the

suggestions made by these thinkers. There is a great deal of pioneer work to be done by America in this respect. The Old World seems more capable than we to think and dream. We must be, and surely are, more capable of action and of carrying out such ideas and dreams as are worth while. Even as we were first to incorporate in Elmira the ideas of the modern school of criminology, so let us be in the foreground in the care of the unfortunate persons whose reason is clouded and who either do not fully comprehend what they are doing when they commit their offenses, or do so because they lack the balance necessary for perfect control of the will and of their impulses. After all, these persons are what society has made them. To society then falls the duty of caring for them adequately, scientifically and, above all, humanely. For they are part of us though they are stricken.

EARLY REFORM IN VIRGINIA

At the last meeting of the Unitarians at the Isles of Shoals, where for fourteen summers they have assembled for papers, discussion, and good fellowship, William Howell Reed was asked to give some reminiscences of his life in Richmond, Va., immediately after the war. The following is an extract from his paper:

"I remember a visit to the Virginia penitentiary with Frank B. Fay soon after the occupation of the city by our troops. Mr. Fay had at one time . . . made a study of the administration of the prison system of Massachusetts and he was interested to see how the old Virginia penitentiary was managed. . . . We were admitted and went through the dilapidated circular courtyard, with its tiers of galleries and cells surrounding it, rising story above story, all of them filled with men. There were more than 600 in all. We met the superintendent, an old man long in its service, a man apparently without a thought in his view beyond repression—fixed in his methods, bigoted in his conception of what a prison should be, an official who held a personal grip on every man in his cell. He was a keeper hard, stern, inflexible, ready to punish with the lash or other torture any infraction of the rules. The old whipping-post was there and it was used brutally. He took us about and showed us the great store-rooms, filled with lumber or rubbish, and all of them unused. This suggested to Mr. Fay their possible adaptation for shops for industries which might give employment to the men, with profit to the state; but this was inadmissible. The men could not be trusted and were to be held

down and punished until their terms expired. . . . Those engaged about the necessary work of the prison, wearing striped clothing, were cowed and broken. As if proud of his ingenuity, the keeper led the way to a room where he had worked out a new form of punishment that he had recently put into operation for the more obstinate men. It was a closet, or box, where a man might stand and be pinioned, with an arrangement above for the dropping of water upon his head, a form of torture which is said to have been used by the Inquisition.

"This capped the climax of the inspection and made a protest necessary. The state of Virginia was under martial law at this time and with General Schofield in command. We reported at headquarters what we had seen. I recall the force with which General Schofield struck the bell on his desk and called for one of his staff to whom he gave the order to take with him a file of soldiers to the penitentiary, to remove the whipping-post, and break up that box of torture; and it was done forthwith. Supervision was then given to the administration of the prison and a new superintendent was appointed and radical changes followed. . . . The selection of Mr. Wardwell as warden proved a good one. He was a good administrator, he was humane, and held enlightened ideas as to prison discipline. He cleared out the old lumber rooms, introduced a few easily installed manufacturing plants, and set the men to work. One of these great vacant rooms was reserved for a chapel and Sunday School and for occasional practice in singing. . . . New ambitions were gradually stirred in some of the prisoners, and during Mr. Wardwell's term of service great changes were wrought there.

"When the army was withdrawn and Virginia resumed her sway over her own people . . . the better prison system that had been instituted was continued."

PRISON DISCIPLINE

Madam Vera Figner, who for more than twenty years was a prisoner in the terrible Schlüsselburg fortress, has written a pamphlet about the cruelties practiced in Russian prisons. It is heart-sickening to read it. The horrors it relates are only matched in a similar pamphlet recently printed in this country depicting the barbarities practiced in some of our own prisons and convict camps. It is not strange that reading such terrible things should lead people of feeling to inveigh against any severe discipline in prison. If a kind-hearted, gentle person, whose whole soul may be filled with love, tries to talk to an ordinary prison warden on this subject, he is at once accused of "mawkish sentimentality," and the warden instead of being converted to milder methods is quite apt to wreak his

annoyance at the first chance on his prison victims.

Those who know nothing about the worst prisoners have absolutely no conception of their brutal and savage instincts. They cannot conceive of the dangers to which wardens and guards are subject in dealing with them, nor the temptations to return brutality with brutality. How gentle and sweet-tempered people would get on as keepers of prisons we shall never know, for wardens are not selected from that type. It might not be a wise experiment. At the same time it is surely wise to have strict laws governing prison discipline and making every form of "punishment" a matter of record.

A prison-shop keeper who has had thirty-four years' experience says:

"No matter how tough the convict may be he has more or less respect for the keeper who is impartial and unafraid, and a deep contempt for those who lack courage and who depend upon stool pigeons to run the shop and punish one convict on the unsupported statement of another convict."

After giving a few illustrations of his own dealings with the most violent convicts, he concludes:

"Although I was considered too severe a disciplinarian by the convicts (and some officers) I always had the best shop discipline, produced the most work with less fights and less punishments; and my reputation among the many convicts that have passed through my hands in the past thirty-four years is that of a square man who, while maintaining strict discipline, never was partial and endeavored to get them their rights under the rules; and *never was afraid*. But in these days of mawkish sentimentalism qualifications of that nature are out of harmony with the present penological conditions."

Are they? It must take tremendous courage to deal with the hardened and determined men who have committed crimes which have thrown them into prison. Those who are conducting prisons and reformatories under the graded system and the indeterminate law need quite as much courage, moral as well as physical, as any Newgate ever demanded. Strict discipline does not mean brutality. The appeal to higher motives is compatible with the exaction of obedience to prison rules and regulations. A wise business and industrial conduct of prison affairs, with a chance for the men to have some interest in what they are making or doing, is quite as likely to "produce the most work" as stringing men up by their thumbs, or lashing their backs.

For the comparatively few dangerous men who are not amenable to rational discipline a truly indeterminate sentence, or the British "preventive detention," in solitary cells, would seem to be the best treatment. Even in the state prisons, where the writer just quoted was constantly in danger, he says he was never assaulted, though often threatened. It is all a hard problem, especially for the theorist; but human nature has vast possibilities, and the brave and intelligent warden, endowed with a sense of justice, kind at heart, and determined to succeed, will work out a system of discipline that will be severe without being cruel; that will leave the prisoner better than it finds him. There are such wardens even now.

CHOOSING A PROBATION OFFICER

The civil service examination which the New York State Probation Commission, acting upon the invitation of the Syracuse Municipal Civil Service Commission, gave to candidates for the position of chief probation officer in the Syracuse Court of Special Sessions of that city is of wide significance in its form, in the sort of men who took it, and in the results.

A credit of 50 per cent was allowed for the written portion; 20 per cent for age, education, and experience; and 30 per cent for personality and character, judged by an oral interview and by outside inquiries.

Of the thirteen who took the examination a majority were college graduates, and of the five certified to the eligible list all were graduates but one—and he was a senior student. Three of the five are lawyers and one a rabbi; four have had experience in social work, three in boys' clubs, one as superintendent of a recreation center, one in a charity organization society.

Timothy J. Shea, the appointee, who stood first on the list, worked his way through Syracuse University and law school but found time to take the highest honors in oratory and to train successfully for the championship crew. He has been superintendent of the largest recreation center in Syracuse and has done boys' club work. As chief probation officer he will deal with both adult and juvenile offenders and supervise the work of a number of volunteer officers.

The questions for the written examination are worth printing in full:

1. State in your own language (a) the nature, objects and advantages of probation; (b) the classes of persons for whom probation is especially suitable.
2. What are the powers and duties of probation officers?
3. Assume that a thirteen-year-old boy, convicted of playing baseball on private grounds, is transferred by the court to

- your probationary care, after being on probation for one month under a volunteer probation officer who reported to the court that the boy failed to report to him promptly as he required, and who made other criticisms of his conduct; assume that the boy lives in a three-room apartment in a congested district; that his father, a painter who shows some signs of lead poisoning, is fretful and has lately been drinking to excess; that the father occasionally sends the boy to a neighboring saloon for beer; that the mother, who has two other children, is a good housekeeper and fond of her children; that the boy is bright in school, peddles papers, is a leader among his boy companions, but is inclined to be impudent. State what steps you would take after receiving the boy on probation, and how long you would wish to keep the boy on probation.
4. Enumerate and discuss some of the chief causes of (a) truancy; (b) petty thieving among boys; (c) public intoxication among men; (d) failure of husbands to support their families.
 5. (a) What are the purposes of the preliminary investigations made by probation officers before defendants are placed on probation or their cases are otherwise disposed of by the court? (b) Assume that in investigating the case of a young man, convicted of stealing and pawning an overcoat which belonged to a commercial traveller, you receive a report from an anonymous source that the defendant has been arrested before, and you also receive a telephone call from a well-known citizen who states that he has known him very favorably for several years; assume further, that the defendant has a comfortable home and good parents; that he had been unemployed for about one month; that he has been engaged to be married for two years; that he has indications of tuberculosis. After assuming any supplementary facts you may desire, state what inquiries you would make; and whether in your judgment the young man should be placed on probation, and if not, what disposition by the court you would consider desirable. Give the reasons for your conclusion.
 6. (a) By whom are probation officers appointed? (b) What qualifications should probation officers possess? (c) Discuss the advantages and disadvantages of using volunteer probation officers.
 7. (a) Why should probation officers keep records and make reports? (b) State the principal facts which their records and reports should show; (c) what records, accounts, statistics, and information should be kept by the chief probation officer which other probation officers are not expected to keep?
 8. Assume that a fourteen-year-old girl, living in a lodging house where her mother is employed as a cook, is convicted of stealing a mask on Hallowe'en Day; that the father, who died last year, left the mother \$1,000 insurance; that the girl is large of her age and goes a great deal with a girl sixteen years old; that she has frequent headaches, especially after reading; that she is fond of music; and that her mother declares her to be untruthful. State (a) whether in your judgment the girl should be placed on probation and the reasons for your answer; (b) if she were to be placed on probation, what sort of a person would make the best probation officer; and (c) what probationary treatment you would suggest.
 9. Assume that an unmarried foreigner, twenty-seven years of age, who has lived in the United States less than one year and who speaks very little English, is convicted of peddling without a license and being abusive to a policeman and is placed under your probationary care for not less than six months; that in his native country he was a gardener and florist; that he has been unemployed much of the time lately, and has borrowed money from one of the two fellow-countrymen with whom he lives in a single room; that a few hours after being placed on probation he strikes a boy for ridiculing his appearance. State what you would aim to accomplish, and what means you would use.
 10. Were you to be appointed chief probation officer, how would you expect to develop and strengthen the probation work in Syracuse?

JOTTINGS

PREVENTIVE DETENTION

In 1908 the English Parliament passed a law known as the Prevention of Crime Act. This was really to meet the problem of the habitual criminal, the greatest of all problems of modern crime, but it has not been very well understood. Preventive detention can follow only upon a sentence of at least three years' penal servitude. During detention prisoners are to be within locked cells or under close supervision, and hard work is to be enforced. "If there were neglect or relaxation in the supervision," says the home secretary, "it would inevitably lead to escape, or mutiny, or vice." The professional criminal will have a harder lot than heretofore. Prisoners will be in three grades—ordinary, special, and disciplinary.

After every six months passed in the ordinary grade with exemplary conduct, a prisoner who has shown zeal and industry in the work assigned to him may be awarded a certificate of industry and good conduct. Four of these certificates will entitle him to promotion to the special grade. With each certificate a pris-

oner will receive a good-conduct stripe carrying privileges or a small money payment.

If a prisoner misbehaves he may be thrust down into the disciplinary grade. Prisoners will receive gratuities for the trade at which they work, and may spend their money on small luxuries at a canteen, or may send it to their families, or may save it. Those who have got three certificates may have a garden allotment, and may sell the produce for the use of the prison at market rates. Prisoners in the ordinary and special grades will be allowed to talk at meals and in the evenings, and have "additional relaxations of a literary and social character", according to the number of their certificates.

"The whole scheme," says the *Spectator*, "leaves untouched the criminal who is most of all a charge upon one's pity—the person without a moral sense, who is not insane enough for Broadmoor, but who preys upon society the moment he is released from prison."

SWISS GUARDIAN CLASSES

Several cities in Switzerland have adopted active measures to prevent juvenile delinquency by the formation of guardian classes to look after children whose parents cannot properly watch over the little boys and girls out of school hours. One of the most efficient of these, Basel, is particularly energetic in this work, with the result that the children of that city have a reputation for good conduct and that the proportion of juvenile arrests is very small for a city of 130,000.

The guardian classes of Basel are organized by the city, which furnishes the teachers, the materials for games and employments, and a luncheon for the children. They are open at intervals from eight in the morning until six in the evening. About a hundred teachers, or directors, are employed. The object is to keep the children busy and happy outside of the regular school hours. Besides games they learn to sew, to knit, to net, to embroider, to sing, and to work with cardboard. They play out-door games and in summer swim, row, and take tramps; and in winter they skate and coast. About thirty-five children are in a class. Last year there were more than two thousand children in these classes.

In addition there is a Playground Society, which last year arranged games in which 8586 children took part, directed by 110 teachers. The city appropriates 3,000 francs (\$600) towards the expenses of these games. A third active society has evening gatherings for children, with singing, reading, magic-lantern pictures, etc. A thousand meet each evening and have a very good time together. These gatherings are not intended primarily to keep children from the street, but they have that effect. Of course kindergartens abound, more than 4,000 little ones attending them. There are evening schools for manual training with 1,600 pupils, whose zeal, application, and good conduct merit praise.

These methods are not all new, for one

society has just celebrated, in a quiet way, its twenty-fifth anniversary. That is a society for keeping the boys off the streets between five and seven in the evening. They are gathered into seven large halls, from five to seven times a week for three months in the winter. They play games and sing, but the chief attraction is that the director tells a long story to the assembly every evening. There were more than 24,000 boys who heard these stories last winter. These are things an intelligent community is doing to prevent juvenile crime, rather than cure it.

TEXAS AND HER CONVICTS

The chairman of the Board of Texas Prison Commissioners, B. E. Cabell, is responsible for the following statements in the *Dallas News*:

"At this time the state has between 600 and 700 men at Huntsville and Rusk within the walls, and about 1,100 on her own state farms. About 1,000 are on share farms, where the state supplies the labor and gets part of the crop.

"At the beginning of the year about 800 convicts were being worked on farms and railroads. Within the last thirty days the railroad contracts have expired and have not been renewed. Some of the men were moved within the walls and others sent to the farms owned by the state. The present commissioners are in thorough harmony with Governor Colquitt, who made it known that he wanted the contract and share farm system abolished as soon as practicable and that all the convicts should be worked on state account. To this end the prison commissioners gave notice to all whose contracts expired with the end of this year that the contracts would not be renewed. This will leave very few men on share farms and none on contracts at the end of this year.

"The state has about 10,000 acres of land beside the 17,000 now in cultivation. This 10,000 acres will be put in cultivation for the year 1912. It is the intention of the prison commission (and has already been done) to put the farms and farm buildings in first-class condition, to make the buildings comfortable and healthful, to have good sanitation, and wholesome conditions and all reasonable arrangements for the comfort of the convicts."

REFORM SCHOOL FOR BOYS

The State of South Carolina sends its bad boys to a reformatory established two years ago at Florence. There are at present sixty-one boys there. Of these nine have step-fathers, twelve have step-mothers, both the fathers and mothers of four are dead, eighteen have no mothers, while two never had any home or father or mother that they remember. The knowledge that the lack of parental training and care had brought so many children into crime life has brought about the passage of a new law providing that if a child is abandoned or being brought up in immoral or vicious surroundings, or without any ade-

quate care or support, it shall be the duty of the judge of probate to commit the child to the care and rearing of the rescue orphanage which was recently started under a charter from the state.

CONVICTS BUILD PRISON

The Topeka, Kan., *Capital* shows how much construction work can be done by convict labor. Lieut. Col. T. H. Slavens, the officer in charge, is building a prison of more than two and a half million dollars in value, though but \$643,000 has been appropriated for it by Congress. The convict workmen, who make the concrete blocks, lay the masonry, build the smoke-stack, etc., are under the charge of foremen from outside. It will require another year to complete it. It will have cell capacity for more than two thousand men.

CONVICTS IN THE WOODS

During the past summer Ontario has had large prison camps in various places. The *Montreal Star*, speaking of the one at Porcupine, says:

"Seventy men have been serving out their sentences in the woods of northern Ontario to the mutual advantage of themselves and the province. In their road-making, they do not compete with other labor to its disadvantage, and they make it possible for the government to open up new country at a minimum cost. The conventional features of penitentiary life, the convict garb, the enforced silence, the uniform monotony of days, are done away with and the cure of honest work in healthy surroundings is allowed to work itself out without the handicap of morbid associations. There is no mawkish sentimentality in making a man who has broken the laws work out his punishment by cutting down trees and filling in morasses on the far frontiers of the province; but there is less of indignity and more possibility of developing self-respect."

VERMONT STATE PRISON

The state of Vermont has a governor interested in prison reform, and his efforts at improving the status of prisoners has been made easier because the legislature has passed a law authorizing all sheriffs to set their prisoners to work "either inside or outside the jails." Concerning the experiment of working them outside, Morrison I. Swift says in the *Atlantic Monthly*:

"During the four years, out of 800 prisoners treated upon the new plan, only two attempted to escape, both of whom were recaptured and sentenced to long terms in the house of correction for betraying the trust reposed in them. With such a record as this the sheriff no longer feels perturbed if his entire corps of prisoners is scattered in every direction during the day, and he is perfectly assured that at night they will reappear at the jail.

"During the whole period their labor earned above \$6,000, of which a total exceeding \$2,600 was kept by themselves. As a rule the men have carefully saved their money, limiting per-

mitted purchases for themselves to send it home to those dependent on them."

REFORMATORY IS NEEDED

Commissioner F. E. Wade, of the New York State Prison Commission, reporting on the penitentiaries, says:

"A state reformatory for misdemeanants, where boys between the ages of sixteen and twenty-one can be committed on an indeterminate sentence and receive instruction in trades and letters, is the most necessary and urgent prison reform under discussion. These boys can now be committed only to penitentiaries and jails, except in the city of New York, and the penitentiary and jail associations and treatment confirm them in criminal habits."

The commissioner suggests that efforts be concentrated on:

First, securing the enactment of the bill prepared by the State Commission of Prisons providing for a state reformatory for male misdemeanants between the ages of sixteen and twenty-one.

Second, securing the enactment of the bills prepared by the State Commission of Prisons permitting the Superintendent of Prisons to market the product of penitentiaries.

Third, some organized action to induce county authorities to establish and extend sufficient industries in the penitentiaries to give employment to all the inmates.

THE PARDONING POWER

When one reads of the wholesale and indiscriminate—and undiscriminating—pardons of which several governors have recently been guilty, it is refreshing to read the words of Gov. J. F. Shafroth of Colorado, addressed to the International Good Roads Congress:

"It is my belief that there should be no pardoning power excepting under critical exigencies. The prevention of crime lies in the certainty of its punishment, and when persons convicted appreciate the extent of the pardoning power, they say, 'Oh, well, we will be pardoned out, so what's the use of being convicted?'"

"The only way in which a person convicted of an offense or crime should be allowed freedom is through good behavior and earning his or her release by hard and consistent work. Give them this work. Show them that they are human, stop their brooding, make it worth while for them to be free, and show them that the lowliest will be recognized with the highbrow offender.

"We should have federal and state laws compelling all persons convicted of offenses or crime to earn their liberty by work, and the convict should receive one-third of his earnings, not for himself alone, but for his family's support and to give him a start when he is liberated."

With the genuine indeterminate sentence, good parole laws, and good parole and probation officers, there would be no scope for the pardoning power, and the governors might be relieved of this responsibility.

SOCIAL AGENCIES

CHILDREN IN RURAL DISTRICTS

J. J. KELSO

General Superintendent of Neglected and Dependent Children for the Government of Ontario

In past years the great bulk of philanthropic effort has been confined to cities. There organization is much simpler and financial support is more readily obtained. Social conditions are evident to all, and where there is distress or poverty, relief is promptly extended. If there is vice or wrong-doing the public eye is equally certain to discover it. In the country, where people are scattered, there is little public opinion and little effective organization to relieve the individual complainant from personal responsibility. Then, too, the generously disposed usually send their gifts to popular city charities.

This means that an important social work is left undone, and too often vice flourishes and degenerate children grow up to be a burden and a menace to the community. Few people realize how serious this problem is, or what an expensive and vexatious addition this means to the dependent and criminal population.

I once made the statement in a public meeting of social workers that many tramps, vagrants, and other undesirable characters are born in the country and afterwards gravitate to the city. This did not accord with the general view, as the majority believed that nearly all criminals and vicious persons are the products of the city slum; but I still believe that a large share of unfortunate characters come from the Ishmaelite class in the country. When the neglected child of the rural district reaches the age of fourteen or fifteen he almost invariably commits some offence that brings him under the censure of the law, and then he either voluntarily or by compulsion disappears from the neighborhood, drifting to larger cities, or tramping about from place to place without home or occupation. Few people realize how many cases, both of boys and of girls, there are of this kind, because so little attention has been paid to the subject.

Without doubt the worst cases of immorality, incest, cruelty, and neglect of children

in my experience have been found in the country. In the cities and large towns there is a strong Christian sentiment and greater social activity. People are better educated in right living, and any serious lapses from the right path are quickly reported and the necessary corrective measures applied. In the rural districts there is little public sentiment of that sort, no united social activity; but, on the other hand, there is the toleration that is often inspired by fear of personal harm. Undesirable characters in the neighborhood are sometimes well known throughout a large area, but no one can be found to lay an information for fear of injury to his person, stock, or property.

The school attendance law is rarely enforced in rural districts. Not only is there lack of effort to get children to attend, but many cases occur where neglected children have been encouraged by the school teacher to stay away. Such cases have come within my experience. Children from a neglected home, if they should happen to turn up at the school untidy and verminous, do not receive a welcome. Other children taunt them, and the teacher, for the sake of the better class of children, tells them to stay at home until they are cleaned up, which practically means banishment. Neglected children frequently use bad language and so are a menace to respectable children. For these conditions the children themselves are not responsible; and yet, unfortunately, they bear all the reproach, and any incentive they might have to a better life is crushed out by the treatment they receive.

In the country it is rare that any definite steps are taken to lift them out of their evil environment. In most rural districts there is great ignorance of the law, and the village or rural constable is usually a man-of-all-work who has taken on this extra duty to add a little to his income. Clergymen and church-workers have never had opportunity to study social reform work, and are sometimes as innocent as babes as to the real evils

that exist in the world. A rural clergyman, long engaged in the ministry, wrote me concerning a notoriously bad woman in his neighborhood, bad because she was feeble-minded, saying: "I am afraid Miss—is not very respectable, for she has had four or five children, although she has never been married." Others have approached grave social dangers and moral pests in the community with the same timid and hesitating method of introduction.

On another occasion a clergyman wrote me that there was a vile resort in his district, and that all the respectable farmers would drive a mile or two out of their way to avoid seeing and hearing the evil-doing that went on there on Sundays, when the wild youth of the neighborhood would gather to carouse.

"Instead of allowing the farmers to drive around this place," I remarked, "why not call a meeting of a few of your influential men and insist on their driving through it?"

"But what can we do?" he asked in astonishment.

When it was explained that the parties could be arrested for disorderly conduct and for keeping an improper resort, etc., he eagerly agreed to have action taken; and as a result of a conference and legal advice, the place was raided, several inmates sent to public institutions or to friends in other districts, and the hovel pulled down so that it could not be used for wrong purposes again.

Among the children growing up in poor families in rural districts there are often physical defects in infants and young people that remain unattended to, and the children grow up with imperfections that could easily

NEGLECTED PEOPLE DEGENERATE.

have been prevented had there been proper medical and surgical care. Feeble-minded children also are found in these families, and when no steps are taken to place them under custodial care they are led astray at an early age, often marry some worthless degenerate, and perpetuate an undesirable class.

All these things point to the strong necessity for better organization, greater vigilance, and more practical measures in eliminating from our rural districts the ignorance, crime, and degeneracy that now exist. Many of these families need sympathetic encouragement. They have been given a bad name, are shunned by the rest of the community, the children grow up recognizing that every man's hand is against them, and so naturally develop all the badness that is expected from them.

The establishment of travelling social secretaries, who could organize social work in towns and villages, create the right kind of public sentiment, and deal radically with extreme cases, would be a step in the right direction. I have often thought that if instead of appointing constables for purely detective and punitive work we could have social up-building and preventive work as their main duty the results would be much more satisfactory. Above all, more attention should be given to education in rural districts; for if children

SIX CHILDREN LIVED HERE.

October 21, 1911.

THE TENEMENT CHILD'S COUNTRY COUSINS.

can be kept steadily under the beneficial influence of the school-room during the formative period of their lives, their prospects for future usefulness and happiness are materially increased.

There is a great lack of rational amusement and recreation in the country. Every small town or village should have a social center building and a good playground. These features, with a competent director, and with club rooms and hall for concerts, dances, etc., would exercise a healthy, pleasure-giving influence that would offset to some extent the deplorable exodus to the cities. If municipal councils and philanthropists would take up this project they would be doing the highest kind of service for the community.

Wealthy and influential city charities should exercise some oversight over the nearby rural districts. Some charities actually draw a line around the city and refuse to touch any case, no matter how urgent, that happens to be outside that line. This is a narrow and short-sighted policy, as it is really the duty and privilege of all charities receiving money from the public to take cognizance of the needs of the surrounding territory. One often hears the excuse, "We have

received our funds from the city, and what right have we to spend any of them in the county?" It is doubtless true that county and town councils have been extremely parsimonious in making grants for social or charitable work; but at least there should be constant educational work carried on until the necessary funds are secured to cover the much-needed rural work.

It would be a mistake to say that we have found the solution to these problems in Ontario, for there are many districts where much remains to be done; but it is at least true that some effort has been made to cope with the need. Our Children's Aid system, which covers the entire province, and is a uniform and co-operative plan, is in itself unique. Outside of many individual workers and correspondents there are between sixty and seventy Children's Aid Societies actively engaged in work for the protection of children, with all the social uplift that such work implies. Further, this united work centers in a head office in the Government Building at Toronto to which the people everywhere in the province are not only invited, but urged, to report any cases of child neglect, so that proper steps may be taken to bring about improvement. In addition to the many societies and committees and correspondents, there are, in various sections of the province, inspectors of Children's Aid Societies who, as representatives of the central office, are prepared at any time to go anywhere when instructed to make these special investigations. In addition to this there is a special officer, attached to the head office, who is constantly on the road enquiring into the cases that are reported to the superintendent. In this way many families are warned and encouraged to put themselves in the way of timely assistance; immoral and vicious conditions are done away with; children are removed to a new environment, when that is obviously the best thing to do; and at all places touched the agent or inspector endeavors to interest influential residents in child-protection work. Literature and letters requesting co-operation in the great work of lifting the social status of the people are sent out daily from the central office, and every possible effort is made to create new conditions of moral wholesomeness and material prosperity where there was formerly degradation, poverty, and despair.

October 21, 1911.

THE WORK WITH THE CHILDREN IN THE LIBRARIES OF GREATER NEW YORK¹

MARY W. PLUMMER

DIRECTOR PRATT INSTITUTE LIBRARY SCHOOL, BROOKLYN

Children's libraries until recently have been in the position of the man whose story is told in William Allingham's *Journal*. Having died, he presented himself before St. Peter, who was doubtless busily employed in separating the sheep from the goats, and who asked perfunctorily, "What are you, a Protestant?" "No, Your Honor." "A Catholic?" "No, Your Honor. I'm nothing at all, Your Honor." "Oh," indifferently, "then you can go where you like." Educators have glanced at libraries and decided that they were not educational institutions; social reformers have not considered them factors in social work. So they have gone where they liked.

A glance at the history of the library's work for children may not be amiss. In 1890, the

¹An abstract of a paper read before the Child Welfare Conference.

older people using the public library of Brookline, Mass., complained that there were so many children underfoot that the elders could not read in quiet. So the librarian set aside a room in the basement for the children, under the charge of the janitor. Without intention it was a scientific move, for in order to study anything you have first to segregate it from other things. The expedient was noted in professional library journals and before long Minneapolis had done the same thing. In 1894 Cambridge, Mass., and Denver, in 1895 Boston, New Haven, Omaha, Seattle, San Francisco, and in 1896 Pratt Institute of Brooklyn followed suit. The era of children's rooms and special attention to children had begun, and hardly a new library was built—even of the smallest size—that did not provide a room or a corner for "the little tots,"

A CHILDREN'S HOUR FOR STORY-TELLING.

as the more sentimentally-inclined wanted to call them.

It was thought at first that with the books open to the children all that was necessary had been done. Librarians did not realize how much they had to learn about children. That was fifteen years ago.

In the Pratt Institute children's library college boys and girls are now coming back occasionally, revisiting the scenes of their long-past youth, and those in charge like to think that when these visitors indulge in reminiscences in years to come, the children's room will bulk large in the scenes of their childhood.

The neighborhood of Pratt Institute has been one of more or less floating population, but it is on the edge of a district where people own their own homes. So the library has had a variety of children: some for whom a fine of two cents a day was prohibitive; some who used the library with more or less condescension. Each year, owing to the new children who move into the neighborhood, there has to be a course of training in the use of public property, in consideration of the rights of others, in quiet manners, in honesty and fairness, in respect for the books, in knowledge of the books.

Until 1906 the New York Public Library had an age-limit for children who might draw books, none under twelve being allowed to do so. The library, like many others, proceeded on an assumption, which it has taken long years to kill, that all children have real homes, that these homes all have books in them, and that the father and mother are intelligent, reading people who will see to the child's needs in a literary direction. If they do not, then the teacher in the public school will see to them.

Brooklyn dropped the age-limit clause in 1901, and, with the appointment of supervisors of work with children, organized work with children began there in 1903, in Manhattan, Richmond, and the Bronx in 1906, and in Queens in 1908. It meant setting aside certain assistants to form the grade of children's librarians, with the end in view of remaining in that service, as the position was not in the direct line of promotion. Trained and experienced children's librarians from the library schools and from other libraries, and general assistants who seemed likely to succeed in work with children, were drawn into the field. At present there are almost as many as there are branches, and every Carnegie branch has a separate room for children, as a matter of course.

In the districts occupied by foreigners, where thousands of small Americans-in-the-making crowd the libraries, these children's librarians are truly a civic force, visiting homes, always with some good excuse, to get the help of the parents; visiting the schools to win the assistance of the teacher; welcoming overtures of priest and rabbi to be admitted to the circle, the only password to which is genuine interest in children.

Since the opening of the children's rooms, in certain districts, at least, the needs of the children using them have more and more become evident. They wanted not only books to carry home, but in many cases some place besides home in which to read or to study their lessons. One has only to visit one or two of the tenement flats from which the majority of the children come to realize how unsuited they are to such occupations as reading or study. Small rooms, often full of noisy children, where the household duties are continually carried on, without good light or good air, frequently too hot or too cold for health or comfort, where the child is constantly interrupted and made to change his place to get out of the way of the housework—nothing but the absorbing curiosity and interest and imagination of a child could survive such trials and drawbacks. The children's department of the library provides a large reading room with plenty of daylight or clear artificial light at night, good ventilation, elbow-room at the tables except at rush times, chairs and tables of suitable size, no rigid rules for silence but a sort of vitalized silence nevertheless, and always someone ready to show how to use dictionaries, encyclopedias, indexes, and card-catalogues, so that help with studies is available. Is not this educational?

The public library has its organized connection with the public schools, naturally, in addition to unorganized work with individual teachers and children. Though the public schools have their own libraries, these are supplemented by travelling libraries in the case of Manhattan, Richmond, the Bronx, and Brooklyn, and the libraries stand ready at any time to do whatever work is demanded for or with the schools.

There are various things which libraries have to combat, but which are bound to grow less in neighborhoods where the children's library has much to do with the children. One cause of these difficulties is the ignorance of parents regarding the power of books. A book is a book to some of these simple people who are anxious for their children to read and write and raise themselves above the parental level; and if their child is engaged in reading he is necessarily acquiring knowledge and power. That there are bad books, demoralizing in one way or another, books that weaken moral fiber, these fathers and mothers do not know and cannot understand. In most of such books there is something—often an obscure something—that attracts. The children's librarian has to find out what the children like in them and seek among her books for something equally attractive with a different influence.

Another difficulty is the indifference of the educated parent—educated in the formal sense of the word. The father absorbed in business, the mother in social life, and both in sport of one kind or another, are abso-

lutely unaware, apparently, of what their children read or whether they read at all.

A growing rival of the library is the moving-picture show. Some librarians have thought to counteract this influence by having educational moving pictures at the library, with references to the books that treat of similar subjects. But the root of the difficulty seems to be deeper down than the character of the things shown.

Aside from the physical effect on the eyes and consequently on the brain, the vogue of these pictures is either symptomatic of a deep-seated defect or abnormality in the constant spectator, or it is the cause of it. For some time children's librarians have observed children—no small number—who do not read but pretend to look at pictures, and who, instead of really looking at pictures, simply turn aimlessly one leaf after another, scarcely glancing at the pages, and lay the book by to take up another to go through it in the same way. Attention seems to be attracted only to things moving—the stationary object has no chance of being regarded by these children. Concentration of attention seems a lost art. What does it mean? Is it like the rage for speed, a sort of narcotic, inhibiting mental action in part while it stimulates the nerves? What is to blame for it? The economic condition of the parent, which requires him to do work requiring no thought, to which, in fact, thought would be detrimental? The conditions of education which require children to go through a given mill and allow small time for the encouragement of individual observation and reflection?

Children's librarians think that in the right books at the right time the old ideals of industry and application, of patience with slow and steady progress, can be saved and made useful, if only the child be taken hold of and separated from the rival influences that make for submersion.

In 1910, 4,326,553 books were lent to children in the five boroughs. Consider that children come voluntarily to these libraries and choose their own books, that the collections are well selected, and you cannot fail to see what a tremendous educative and civilizing agency the public library, rightly administered, has come to be. Among these readers are the thinkers, the scholars, the men of action, the lawgivers, the publicists (men and women), the fathers and mothers and teachers of the next generation.

HEARING TALES FROM BOOKS ABOUT ANIMALS.

As many as twenty-five nationalities are reported as using some of the branch libraries; and as these children are getting from the books they borrow American history and biography, subtle suggestions of good breeding and etiquette, and a knowledge of the upper levels of life to which all in a free country have a right to aspire, it must be admitted that the children's library is a pervasive ingredient in the melting-pot. The ignorant foreigner, as we call him, often knows vaguely his country's history, yet when he comes here he finds himself despised because he cannot speak or read our language; he is tempted to regard himself, his country, and all that belongs to it as of little worth. The libraries try to check this waning of self-respect and of consciousness of worth in the children, at least, by reminding them of their race's titles to respect and admiration and by trying to prove to them that the new patriotism may include the old.

The libraries all make use of story-telling and of the picture-bulletins, for they have discovered the value of suggestion. They are gradually making their contributions to child-psychology by experimenting to gain certain ends and watching the effect. The story in itself, if well selected and well told, is a simple, inexpensive means of enjoyment with a universal and everlasting appeal, and through it the children's librarian leads to her books, which are at hand when story-tellers are not and which are without the limitations of story-telling.

As for the picture-bulletin, its uses may be informational, inspiring, or strictly suggestive. Carefully made, with due regard to artistic principles, reserved for sufficiently great subjects and great occasions, it has the virtue of

condensation, and of showing the various phases of a subject at a glance, with the clearness and the instantaneous grip on the mind of all good graphic explanation, and it, too, leads to the book; for, though the bulletin itself may not have much text, it is not a bulletin unless it contains a list of references to sources in which the reader can find more on its subject.

Co-operation with other agencies is often brought about by mutual attraction. In Brooklyn the supervisor is in close touch with several clubs of mothers, discussing with them the importance of right reading for their children at home and of the purchase of the right books as gifts. In Manhattan co-operation with the schools brings about the visits of teachers and their classes in a body to the library. Queens sends story-tellers to

at least one playground and addresses one public school mothers' club. Of the travelling libraries for children sent to various places I have already spoken.

It is not my intention to magnify the office of the children's librarian, but to magnify once more the office of the book. There is testimony from the beginning of recorded history of the importance of thoughts and ideas. "As he thinketh, so is he," said Solomon, and all the ages since have subscribed to the saying. The printed word is probably more powerful still in spreading thought and hence in making real men and women than any other agency; and it is the thought that becomes an assumption, the thought that goes into the making of the *boy* or *girl*, that is really most influential of all, for, we are told, "implicit assumptions rule the world."

MOVING PICTURES IN THE PLAYGROUNDS

E. M. BEST

ASSISTANT SUPERVISOR OF PLAYGROUNDS, WINNIPEG, MANITOBA

The value of motion-pictures for educational purposes has been frequently pointed out. Last year several cities reported that they had given moving-picture entertainments in their recreation centres, with good results. It has remained for the city of Winnipeg, however, to take the first step in using motion pictures as a medium for a definite program of popular education.

In less than twenty-five years Winnipeg has grown from a crude outpost of civilization into a splendid, modern city. Park and school sites are purchased years before they are needed. As a result of this policy the city has nearly forty splendid modern school buildings and nearly everyone of them has a full city block for a playground. Small parks are scattered all over the city and two big recreation parks are in process of making.

Three years ago, the city fathers took over the newly started playground system and provided funds sufficient to equip and maintain five playgrounds during the summer months. This year the city council unanimously voted \$12,000 for thirteen playgrounds. As the school grounds are available and are of ample size, the commission is able to devote the yearly appropriation entirely to apparatus and supervision. Each summer a definite program of games, athletics, gymnastics, folk dancing, and swimming is carried through. This year several special features were arranged, such as: an exhibition of playground activities on Civic Holiday at the new City Park; a Tooth-Brush Day, as part of a campaign on dental hygiene; an inter-playground competition or play-fest in which nearly two thousand competed; and, finally, a series of moving-picture entertainments.

These moving-picture entertainments were one of the most successful features and fully demonstrated their value as a means of reaching the people. The programs were put on out doors every night for over two weeks. Each playground was visited in turn and the children were urged to bring their parents. No admission fee was charged and the attendance was both large and enthusiastic.

The films were carefully selected and the vital points in each were clinched by the use of slides. The use of slides also made it possible to advertise the purpose and ideals of the playgrounds, and to stimulate the feelings of social ownership and civic pride. In addition to the pictures a musical program by gramophone was arranged.

One of the motion-picture exchanges made a very favorable rate for the use of the films, screen, and machine, and also supplied the operator for the series. The machine was mounted on a truck and placed about 100 feet away from the school building. A heavy stage cable connected the machine to the switch-board in the basement. The eighteen-foot screen was hung from the second story windows of the school, and in less than half an hour the performance was ready to begin.

As soon as it was dark enough, the director had the smaller children sit on the ground in a semicircle about thirty feet back from the building. In a short speech he welcomed the parents to the play-ground and made such special announcements as were necessary, and then the performance began. First there were a few slides telling about the playgrounds, such as:

"This playground is conducted by the City Playground Commission. They conduct thirteen playgrounds during July and August."

"These playgrounds are free. They aim to make strong bodies, keen minds, and good citizens."

Then came the first film, entitled, *The Man Who Learned*. This is an impressive story of the danger from a dirty dairy. The slides following were intended to convey similar lessons; as, "Cleanliness is next to Godliness, but it takes some folks a long time to get wise." The next film, *The Red Cross Seal*, dealt with the problem of tuberculosis, and was followed by slides such as, "Fresh air and sunlight are the best safeguards against disease. Keep your windows open day and night."

Then followed a comedy film called *Tam and Jock*, which told of the troubles of two young Scotch farmers when they joined the Gordon Highlanders. This film raised a perfect storm of laughter every time it was shown. After this came slides giving some playground ideals:

"Don't be a grouser—play the game."

"The school buildings and grounds belong to you. Protect your property against injury."

"Trained directors on each ground teach games, athletics, gymnastics, folk dances, and fair play in everything."

Last of all was a double film on the fly question. The first half was the well-known *Fly Pest*, which gives the life cycle of a fly and how it carries contagion. The second half was the humorous film *Swat the Fly*, giving the adventures of Mr. McSwat in his individual campaign against flies. The program closed with cheers for the ground and the singing of *God Save The King*.

The pictures were quite plain fifty yards away and not once was there a break-down of any kind. The order was excellent, and although a policeman was always present, there was no need to call upon him for service. The slides were generally spelled out by the children and frequently interpreted by them to foreign-born parents, and all of the moving pictures, both humorous and serious, were appreciated.

The expense of this plan of public education was small, and the commission was delighted with the success of the innovation. A much more extensive program is being planned for next year and no doubt many cities will follow the example of Winnipeg.

A SCHOOL-YARD CROWD.

JOTTINGS

SOCIAL CENTERS POPULAR

Harrisburg, Penn., is in the throes of a campaign for social centers. At a meeting of the Bureau of Education and Professions of the Board of Trade on September 18, a resolution was drawn asking the school board for the use of the auditorium of the Technical High School for one such center, and for the appointment of a committee to establish others. The whole city seems to be eager for the innovation. The plan is to establish in the building of the technical high school a recreation place which will be opened several evenings each week.

VILLAGE PUBLIC SPIRIT

At Croton-on-Hudson there was recently a good illustration of the way in which small places may contribute to reforms. Heretofore the district nurse in the community has drawn little financial support from the village. Fortunately several city families have moved out there, bringing with them the spirit of community of interest and of aid. So when it was necessary to raise an extra hundred dollars, instead of following the usual method of a social affair at a dollar admission, the villagers themselves were induced to give the entertainment, with tickets at twenty-five cents. The Italian and Hungarian villagers danced their national dances and sang their own songs, and the children of Americans danced old English dances. More than one hundred and fifty dollars was raised; but better than that was the spirit of village self-aid which was developed.

PERSONALS

They drop out, the old fighters, one by one, and it grows lonesome in the gap they leave, till we pull ourselves together, close up ranks, and catch our step again. John Bancroft Devins left a wide gap. He was so many-sided. His sympathies were so broad, and withal in his method he was always sane.

JOHN BANCROFT DEVINS.
Sept. 26, 1856—Aug. 26, 1911.

Our paths crossed first when we were reporters together on the *Tribune*, in the old days. He was a good man on "a story," as by and by he proved a good man at the desk, for he was faithful in all he did, unselfish ever. Already then he was busy with the little "fresh-air" whose lives he followed from the dark tenements into God's out-of-doors and back to their homes of poverty, because his interest was not merely the reporter's, but that of the lover of men. It was natural that when he went to preach it should be among his friends on the East Side. He did more than preach to them; he was their pastor and friend. I saw him at his work there, for we never parted company from the beginning. When he died we were fellow-members of the Citizens' Committee that is battling for a people's park on the seashore. He knew what that meant to the crowded tenements, and he joined as a matter of course.

"What can I do?" he wrote, and every step after that he followed with watchful interest.

On the East Side he was an organizer of the people for good works. Always he was a staunch lieutenant of Mrs. Lowell, which of itself tells where he stood and for what things. He sat in the first Small Parks Committee, and the lines it laid down we have followed since. From its meetings in the City Hall he went to his labors in the *Tribune* office for the fresh-air children. Often he went with them on their journeys and they loved the kindly man. It seemed as if nothing could tire him out. When engrossing editorial work on the *Observer* came to him, he kept his grip on his little friends. Editing, preaching, traveling in later years, he remained ever the plain,

homelike man who labored up the many flights of stairs in the East Side tenements to his "poor people" and knew their every need and want. Whether he directed the cleaning of alleys and whitewashing of tenement cellars as a means of keeping the poor from starving in the hard winter of 1893-4, or sat in some board of wealthy philanthropists who looked to him to find wise ways of helping where help was needed, he was the same sane, great-hearted man.

He was not far gone in the fifties when his work ended, and to us it seems a waste of useful years yet to come. But we know that in God's providence there is no waste. And is there anyone who in his soul really believes that John Bancroft Devins's work is ended with his earth-life? JACOB A. RIIS.

Paul Kennaday has been appointed secretary of the New York state branch of the Association for Labor Legislation. Mr. Kennaday brings unique equipment into this field of work. A lawyer by profession, he gained intimate acquaintance with tenement and labor conditions as a resident and member of the Board of Directors of Greenwich House for five years. One year after its organization, Mr. Kennaday became secretary of the Tuberculosis Committee of the New York Charity Organization Society, and in the three years following organized the framework of its campaign of education and prevention—a pioneer among the various city, state, and national associations which have come into being since. With Wilson in Boston, Hatch in Washington, Easton in Minnesota, and Wing in Chicago, Kennaday has been one of the few laymen who have mastered the technique of this medical-social propaganda, balancing and giving wider application to the work of the members of the medical profession who have thrown themselves into it. He organized a joint committee on tuberculosis with the New York Central Federated Union and carried on consistent educational work among the different trades in which there is high death rate from the white plague. In 1908 Mr. Kennaday made special studies of the progressive labor legislation and social statesmanship of the Australian commonwealths, and wrote a series of articles for the *Outlook* on these subjects.

It is therefore with a grasp of labor conditions and legislation here and abroad, acquaintance with leaders in the labor movement and with the law, and with the technique of social propaganda at his command, that Mr. Kennaday enters his new work. His predecessor was Crystal Eastman, whose signal service to the association was to act as secretary and executive officer of the New York State Employers' Liability Commission in its work of investigation and in getting out its notable reports on prevention of accidents, the control of unemployment, and workmen's compensation. A large work in popular education and legislation is now ready to the hands of

the association, rendered more urgent in some of its phases by the adverse decision of the New York State Court of Appeals with respect to the pioneer compensation law secured by the commission.

Last spring Miss Eastman was married to Wallace Benedict, of Milwaukee, and in September was admitted to the Wisconsin bar.

Charles W. Birtwell, whose acceptance of the office of executive head of the new American Federation for Sex Hygiene was reported in *THE SURVEY* last week, has for twenty-six years been a leader in the child-saving work of Boston and the United States. Graduating from Harvard in 1885, he chose philanthropic work at a time when university men were few in that profession, and went directly into the service of the Boston Children's Aid Society.

The key-note of his work was struck early in his connection with the society. In the first published reports to the directors he said:

"The pains taken have been abundantly repaid in seeing cases for which nothing or the wrong thing was likely to be done taken in hand by the very societies that were best equipped to afford the needed relief. . . . It has always been borne in mind that the sundering of family ties—the separation of a child from a father or mother, or the scattering of brothers and sisters—is a serious matter, requiring for its justification grave reasons and evident advantage."

Speaking of the newly established Bureau of Information a year later, he said:

"The aim will be in each instance to suit the action to the real need, heeding the teachings of experience; still, to study the conditions with a freedom from assumptions and a directness and freshness of view as complete as if the case in hand stood absolutely alone."

"In these three passages," writes one of his New England associates, "may be found the fundamental principles of action which have characterized the work of the Boston Children's Aid Society for the last quarter of a century: the utilization of every agency which can be enlisted in the service of childhood; the unceasing emphasis upon the home as the hopeful center toward which social endeavor should be pointed; the insistence upon individual personal consideration of every problem; and in the multitudinous variety of intricate questions arising day by day, year after year, a remarkable directness and freshness of view. In going from the Children's Aid Society to take up the work of the American Federation for Sex Hygiene, Mr. Birtwell feels that he is only passing into a field which touches all along the line the one he is leaving. He carries with him into his new work the best wishes of many whom he has stimulated and inspired by his faith and fervor."

In 1891 Mr. Birtwell visited England and France to study charities and industrial education. He was one of the two editors of the *Care of Dependent, Neglected, and Wayward Children*, a report of the Second Section of the International Congress of Char-

ities, Correction, and Philanthropy which met in Chicago in 1893. In 1896-97 he was appointed a member of the Advisory Board on Public Institutions of the city of Boston. He has served upon the boards of directors of the Massachusetts Prison Association, the New England Watch and Ward Society, the

CHAS. W. BIRTWELL.

South End House and the North End Union, and has been an active member of the Massachusetts and National Conference of Charities and Correction.

The State Board of Education engaged Mr. Birtwell in 1895 to assist in an investigation of school attendance and truancy, and to draft needed legislation on truancy, truant schools, and allied subjects; the results of his work appeared in a report published in 1897, of which he was one of the two authors.

Mr. Birtwell was president of the Monday Evening Club—a club of paid officers of social organizations of Boston and vicinity—from 1893 to 1895. The club was organized at his suggestion in 1888, and he was its first secretary. Its usefulness has prompted the organization of similar clubs in many of the larger cities of the country.

From 1894 until 1904 he was executive director of what is now known as the Social Service Committee of Harvard University, formed for the purpose of guiding and stimulating student volunteer charity work. He is a lecturer at the New York School of Philanthropy, and at the Boston School for Social Workers.

At the last meeting of the National Conference of Charities and Correction, held in Boston in June, a Section on Sex Hygiene was created for the conference a year hence in Cleveland, with Mr. Birtwell as chairman.

J. Prentice Murphy, successor to Mr. Birtwell as general secretary of the Boston Children's Aid Society, comes from Philadelphia, where he has been connected with the Children's Bureau since the winter of 1907. He has been its superintendent for the past three years. While at the University of Pennsyl-

vania, where he specialized in political science, history, economics, and sociology, he was a special investigator for the Pennsylvania Child Labor Committee, a club director in the university settlement, and an agent for the Pennsylvania Society to Protect Children from Cruelty. In the summer and fall of

J. PRENTICE MURPHY.

1907 he assisted in a special investigation of the labor of women and children in the canning factories of New York, and during part of that time was a resident and club worker at the East Side Settlement House in New York city.

In connection with his work in the Children's Bureau, Mr. Murphy organized a round table conference between the colored and white institution directors and workers which has proved a very important factor in raising methods and standards of child care in Philadelphia. He was a member of the executive committee of the Mayor's Conference for Summer Care for Mothers and Children, and also of the Milk Committee. He has been a lecturer in the Philadelphia School for the Training of Social Workers and in the Deaconesses' Training School.

No fewer than four changes in personnel have just taken place in Brooklyn settlements. Dr. Jane E. Robbins becomes headworker at Little Italy Settlement, Alice E. Robbins becomes assistant headworker of the United Neighborhood Guild, and Alice Spink becomes headworker at Friendly House with Bessie Dunlap as assistant.

Dr. Robbins is one of the pioneers of the settlement movement; it was as an early headworker of the College Settlement that she first impressed it with her personality. But it has been the distinction of her neighborhood work that she has purposefully left one field for another where new ground was to be broken and difficult situations mastered. To-day as a consequence she has spheres of friendship in the upper East Side, in Baltimore, and in Brooklyn, as well as along Rivington street. One of the foremost members of the society for the Protection of Italian Immigrants, a fluent speaker of their tongue, and a rare discoverer of the cultural values which the Latins bring to America, a summer's trip to Italy during

which she has studied certain phases of the immigration movement makes her coming to "Little Italy" like a new visit from a long-time friend. Dr. Robbins closed a three years' secretaryship of the Public Education Association to re-enter the field of neighborhood work.

The United Neighborhood Guild, of which Alice Robbins becomes assistant headworker, comprises Asacog House, Italian Settlement House, and Maxwell House. Earlier a Greenwich House resident in New York, Miss Robbins served for six years as headworker of Lawrence House, Baltimore, building up the work from small beginnings. This she relinquished to assist Mr. Woods and Mr. Kennedy of South End House in their study of American settlements, visiting the settlements of nearly all of the large cities of the country.

Miss Spink, who is a graduate of Wellesley and of the New York School of Philanthropy, has for four years been assistant headworker at Greenwich House. While there she made an extensive study of artificial flower manufacture in Greenwich village and acted as member of the local school board. Previous to her residence at Greenwich House, where she had charge of the summer work, Miss Dunlap was connected with the Doe Ye Nexte Thyngs society, which maintains a settlement house on Leroy street, New York. Mabel Foster, Bryn Mawr 1907, becomes Mrs. Simkhovitch's assistant at Greenwich House, to succeed Miss Spink.

Francis H. McLean, who was elected secretary of the new National Association of So-

FRANCIS H. McLEAN.

cities for Organizing Charity, has been identified with charity organization work since his college days. Graduating from the University of California in 1892, Mr. McLean spent several years in graduate work in Columbia and Johns Hopkins Universities, and in 1897-8 was fellow in sociology at the University of Pennsylvania. For the next two years he served

as assistant secretary of the Brooklyn Bureau of Charities. In 1900 came a call to Montreal, Canada, where he organized a charity organization society, and spent two years as its general secretary. From 1902 to 1905 he filled the position of general district secretary of the Chicago Bureau of Charities and in the succeeding two years that of superintendent of the Brooklyn Bureau of Charities. At the time of the San Francisco disaster in 1906, Mr. McLean was one of the experienced relief workers to respond to the emergency, and served as superintendent of the rehabilitation committee in the management of the San Francisco relief and Red Cross funds.

During the four years of his service as field secretary of the Charity Organization Department of the Russell Sage Foundation (in its initial year this work was carried on under Charities Publication Committee), Mr. McLean's work, widely placed as it had been, became definitely national.

Primarily his time was spent in advising and organizing charity organization societies throughout the country; over fifty have been organized since October, 1907. Throughout a broad definition has been given to this work; he has conceived of it as educating the social sense of the community, liberating those forces which make for an equitable standard of social justice, and giving right direction and cohesiveness to humanitarian sympathies.

His plan of campaign, when a "needy city" called for aid, has never been of the one-day popular meeting, then go, type. On this head it is perhaps most illuminating to read what an associate wrote of his daily work:

"When we consider that in nearly every instance the cities which he has visited have been induced to employ a trained secretary and have often trebled their original budget at Mr. McLean's earnest solicitation, it is evident that he has been making a most substantial addition to the effectively organized social forces of this country. . . . In one place he has gone out of his way to help in establishing a juvenile court, in another he has undertaken to start a child labor committee. In short, Mr. McLean is one of the best of a new type of social surveyor, in that his view is comprehensive and that he is also quick to see beneath the surface and make full allowance for the defects in any effort that is single-minded and devoted."

Frederick S. Hall succeeds Mr. McLean as associate director of the Charity Organization Department of the Russell Sage Foundation, with training as statistician, public official, and social worker. After his graduation from Wesleyan University (1893), and after taking his Ph. D. degree at the School of Political Science of Columbia University (1899), he spent three years in the United States Census Bureau. While there he prepared a bulletin on the localization of industries in the United States. For two years he served under Lawrence Veiller as assistant

secretary of the New York City Club. A year followed as head resident of Newark, N. J. Neighborhood House. His two years (1902-4) as secretary of the New York Child Labor Committee were complemented by three frontier years (1908-1911) as secretary of the Pennsylvania Child Labor Committee. His

FREDERICK S. HALL.

legislative work has been constructive. He has been exceptionally successful in securing the co-operation of public school authorities in his kindred work. An effective organizer, with a broad grasp of the social uses and significance of statistics, and a quick mastery of office detail, he brings distinctive equipment to his new field of work.

The division of labor between the Charity Organization Department and the National Association was outlined in *THE SURVEY* for October 14.

Maurice Willows, Mr. McLean's associate, has been identified with Y. M. C. A. work and with children's societies. During the Spanish-American War he acted as provincial secretary for the field department of the army Y. M. C. A. Later he spent two years in similar service in Alabama, Mississippi, and Louisiana. Going to the Birmingham Boys' Club as executive officer, he assisted in the establishment of a Children's Aid Society and a juvenile court. His six years in Birmingham have been at a time when the social forces of the south are awakening. In 1910 he was one of the organizers of the first Alabama State Conference of Charities and Correction, and its general secretary. He is vice-president of the National Conference for the Education of Backward, Truant, and Delinquent Children.

The news coming several weeks ago from Detroit, Mich., that Judge Frederick Bloman had died, fell upon an ignorant and at first unresponsive public. Who was Judge Freder-

ick Bloman? Three days later thousands knew his life story.

Frederick Bloman, thirteen years old, illiterate, red-headed, and undersized, a rescued waif and an ex-incorrigible, was judge of the Citizens' Court of the Ford Republic for boys at Detroit. Four years ago he was consorting with hoboes and begging food for them. He was a dirty, swearing, tobacco-chewing imp, with no recollection of a home or a mother, and with no respect for any living thing. Yet at his death a judge of Michigan's Supreme Court travelled one hundred miles to attend the funeral, the Probate Court of Wayne County adjourned over two days in his honor, leaders of bar and bench held a meeting to pronounce his eulogies, and men and women of distinction gathered round his bier in the nave of St. Paul's Cathedral.

Ford Republic, the superintendent of which is Homer T. Lane, is a home for wayward boys. It is greatly similar in its principles of punishment to the better known George Junior Republic. For a time after Fred Bloman was brought there the habits of his former life made him one of the most unmanageable boys in the republic. He had been taken by the police from a band of gypsies and is said to have been one of the most foul-mouthed youngsters whom the authorities had ever discovered.

His reformation while at the republic was gradual but sure. A strong sense of humor brought him ultimate popularity and after three years' residence the boys elected him judge of their Citizen's Court for a term of six months. After two re-elections he died in office.

On the bench young Bloman displayed ingenuity, tact, and ability in handling his fellow-citizens. A lad charged with "punching another in the kitchen" defended himself by saying he had punched the other, not in the kitchen, but in the stomach. Instantly the judge retorted that his stomach was his kitchen because he kept his "chuck" there. Later he declared that he would put a stop to the "punching in the kitchen" and "kicking in the basement" that had been going on recently. While trying an alleged thief, Fred once asked the accused, "Then you're willing to be known as a crook?"

The defendant made no objection and Fred ruled: "Well, you are a crook."

Later he was brought before the supreme court for applying the word crook to the accused. In defending himself Fred evolved a definition that has since become classic in the republic: "A crook is a fellow who is willing to be called a crook."

Heart-disease caused his death. In his speech in the probate court one of the attorneys said: "He was one of the most efficient aides this court ever had in its juvenile work."

Emma W. Lee, for fifteen years with the Associated Charities of Boston, has been appointed assistant to Dr. Kirk, General Secretary of United Charities of Rochester.

A wide open schoolhouse prevents a wide open town

Many a man and boy hangs around the saloons at night for sheer lack of something more interesting to do—and a place to do it.

Meet this social need by opening the schoolhouse evenings, for lectures, games, debates, athletics, clubs.

The "wider use" plan for the schoolhouse has succeeded in many communities; why not in yours?

The school people are willing, but someone has to help start it—tip the scales of public interest their way.

There's a book tells just how to do it, where it has been done, what it costs; a practical, illustrated handbook:

WIDER USE OF THE SCHOOL PLANT,
by Clarence Arthur Perry.

One of the Russell Sage Foundation Publications, now in its second edition.

Now is the time to start something, with the long, idle winter evenings just ahead.

The book sent postpaid, by return mail, for \$1.25.

THE PITH OF IT

The creation of a Federal Children's Bureau, the entire prohibition of family work in tenement houses, the elimination of child-workers from the canneries of New York, 6-day, 8-hour legislation applied to continuous industries—these are some of the planks in Theodore Roosevelt's legislative platform; the things he is going to work for as a citizen as put forward at a Carnegie Hall meeting in New York last week.—p. 1069.

The conservation of Yankees!—Joseph Lee puts the toast.—P. 1087.

Dust, babies, and disease—two New York experimenters think they have found the medium through which infantile paralysis spreads.—P. 1081.

Last summer the New York legislature passed bills which may put the state factory department, in staff and organization, on a level with that of England. The law called for the appointment of eight supervisory inspectors. During the dog days, with the connivance of the State Civil Service Board, the politicians all but raided the roost in a way which would have subverted the whole system. An eleventh hour fight to block the spoils is on.—P. 1083.

The women teachers in New York public schools, after a campaign lasting years, have secured "equal pay" legislation.

Postmaster General Hitchcock and the assistant attorney general who is advising him have had a second thought. On October 14 they rescinded their order barring the Chicago Vice Commission report from the mails. But they particularly limited their permission to "the remaining copies of the present edition"—the 1,800 which were actually held up. The question arises: Will they get a third thought if there should be an eighteen hundred and first copy?

It took a seven years' fight for Charles B. Stover, then a private citizen, to get Seward Park cleared and opened by the municipality. It was not till after Jacob Riis's long "battle with the slum," that the buildings at Mulberry Bend were razed and a park laid out. Stover in the early stages, and Riis in the successful fight waged all summer, have been the leading figures in the 7 years' campaign for Rock-away Beach just ended—P. 1076.

The spirit which made thousands in drenching rain parade a city's streets last spring, mourning the loss by fire of 145 factory workers, is again at work in the New York Factory Investigating Committee, now holding its hearings.—P. 1077.

The Michigan State Board of Health has authorized an investigation of industrial conditions, thus following the lead of the Illinois Occupational Diseases Commission. The plan is one in which Gov. Osborn has especially interested himself.

With the consolidation of three bodies committed to constructive social work among Negroes, a new epoch opens in the effective consideration of this phase of the American city problem.—P. 1080.

SOCIAL FORCES

BY THE EDITOR

THE INVISIBLE RELIEF FUND

Society is a growing, self supporting organism. It has within it, as between family and family, neighbor and neighbor, master and employe, endless links of sympathy and self support. Poverty is not an absolute, but a relative term. Naturally the members of one class help one another; the poor help the poor. There is thus a large invisible fund available and constantly used by those who, by their proximity to one another, know best how to help. The philanthropist is an alien to this life around him. Moved by a sense of contrast between his own lot, as he understands it, and the lot of those about him, whom he but little understands, he concludes that he should relieve them. But his gift, unless it be given in such a way as to promote this self support, instead of weakening it, is really injurious. In the first place, by his interference he puts a check on the charitable resources of another class and lessens their social energy. What he gives they do not give, though they might do so. But next, he does more harm than this. He stimulates expectation, so that by a false arithmetic his gift of a few shillings seems to those who receive it and to those who hear of it a possible source of help in any difficulty. To them it represents a large command of means; and where one has received what, though it be little, is yet, relative to wage, a large sum to be acquired without labor, many will seek more, and with that object will waste their time and be put off their work, or even be tempted to lie and cheat. So social energy is diverted from its proper use. Alms thus given weakens social ties, diminishes the natural relief funds of mutual help, and beggars a neighbor instead of benefiting him.

The new Encyclopedia Britannica in the course of its article on charity and charities sums up, in the paragraph quoted above, the conception of Dr. Chalmers on which the parochial system of St. John's, Glasgow, was founded—a system which, as the article puts it, is "consistent with the best traditions of the Scottish church"; has been "tested by experience"; and has been a main factor on the economic side in the later development of the theory of charitable relief. It is a conception which although not sufficient to account in full for the modern philanthropy is yet one of its essential elements. Let us analyze it with reference to modern urban conditions. The first and most important consideration is that it is addressed to a local neighborhood and is designed to keep alive there the natural, spontaneous springs of neighborliness and mutual assistance. The appeal is not so much to philanthropists to keep their hands off—although that is implied. The appeal is to the self respect of the poor and their neighbors not to seek or accept aid from strangers. The parish is to look out for itself, without endowments, without public relief, without private relief funds, without church alms. Reliance is to be had upon the large invisible fund to be supplied as the need arises by neighbors, relatives, employers—by those who are united to the afflicted in natural links of sympathy and support. If outsiders are asked not to interfere this is because of the frailty of human nature, the tendency to accept "wind falls," and the consequent danger of drying up these really larger but less obtrusive springs of benevolence which lie in natural personal relations. The idea is therefore positive and constructive. Its message is democratic and social. For every person to whom it says Refrain, it seeks out scores to whom it says, Be alert to give, to help your neighbor. You workingman, retail dealer, farmer, or housewife—whoever you may be that stands as nearest friend, as

next of kin or as next door neighbor to a family in which there is a sick child, to a widow who cannot quite make both ends meet—Bestir yourself and see that the one has a nurse and nourishment, that the other has shelter and food. Be ashamed that either should ever be tempted to seek aid from a philanthropist or from a charitable society, or from an overseer of the poor. It is your poor who are thus in danger of losing their natural independence, Quick! to the rescue!

The second large fact about poverty, as we find it in American cities, is that there is not enough of it to warrant discouragement. Broken into natural localized portions it is manageable. Not widespread degeneracy and inadequate resources, but remediable hardships and removable obstacles to self dependence, furnish our problem. Poverty here is an accident. We encounter it, but we refuse to accept it as inevitable. The third large fact is that here as elsewhere, as yet, in spite of a few generous Foundations and many well conceived schemes of preventive philanthropy, the main burden of what poverty exists is borne by the poor and not by the rich. If neighborly assistance were to disappear for a month it would be a far more serious thing than if all the relief agencies were to close their doors for that length of time.

What then? Is there no legitimate place for the gifts of the rich? Is there no justification for the established relief agency? Is there no need for organized charity? The munificent gifts of the rich are indeed needed and in still larger amounts, but they are needed mainly to change adverse conditions caused by the very forces, industrial, economic, and social, on which frequently their own greater incomes depend. "There is no form of philanthropic activity," as Professor Seager says in his Briefer Course in Economics, "which is more certain to benefit mankind than that designed to improve the conditions under which the mass of men work and live." Such expenditures, sensibly directed, will not dry up the springs of neighborly assistance but will increase the capacity for self help and for mutual neighborly assistance. Relief agencies are increasingly applying their resources under the guidance of the principle that relief is only an instrument—one among many, but often an indispensable instrument—in helping to self dependence.

Organized charity, as now understood and practiced by enlightened social workers in America, is directed persistently towards the conservation and development of the large invisible fund to which Dr. Chalmers refers. No doubt individuals make stupid mistakes, as doctors, teachers, judges, and bankers make mistakes in their several fields; but the idea of organized charity is right, and it is consistent with Dr. Chalmers' conception that the main reliance of society in the relief of individual distress must be upon the family, the neighbor, the ones with whom the afflicted stands already in some natural relation. Modern philanthropy calls for the expenditure of large sums, whatever sums are necessary to eliminate repression and exploitation; and realizes also that it is not large expenditure alone, but concerted social action of many kinds that is necessary to bring this about. On the other hand, it appreciates the delicacy and difficulty of the task of ministering to the needs of the poor, and sits, an eager and humble disciple at the feet of those who like St. Bernard and St. Francis, like Ozanam and Chalmers, like Edward Denison and Josephine Shaw Lowell, have caught some glimpses of the meaning of the infinite love which is charity.

THE COMMON WELFARE

CONSERVATION AND CHILDHOOD

Giving up the latter half of his address to the part which the courts in America play in the matter of social legislation, and paying vigorous respects to those "mischievous judicial decisions" which have blocked the will of the people to improve conditions, Theodore Roosevelt spoke last week at Carnegie Hall, New York. The meeting was a joint one arranged by the Civic Forum and the Child Welfare League, and in the course of his address to crowded galleries Mr. Roosevelt outlined several constructive lines of legislation to which he urged the people of New York state and the nation to address themselves. His subject was the Conservation of Womanhood and Childhood, and he put its force and meaning in these words:

We have begun to realize that we are guilty of crime against our children if we hand them over a wasted heritage. But after all, the most important type of conservation is the conservation of the manhood and womanhood of the country; and vitally important though it is to leave our children a proper heritage, the one thing of supreme importance is that we shall leave the right type of children, children of such character and living their lives under such conditions that they shall be fit to enjoy and make use of their heritage. It would be a dreadful calamity to continue to waste and destroy the resources of the nation as until a few years ago we were wasting and destroying them, as we still in certain respects continue to waste and destroy them. But it would be an even worse calamity, because irremediable, if we wasted and destroyed the manhood and womanhood of the nation. And the only way permanently to conserve the manhood and womanhood is to conserve the childhood.

First among the measures Mr. Roosevelt advocated he put the creation by Congress of a Children's Bureau in the Department of Commerce and Labor to gather, classify, and distribute for popular use in the states and territories accurate information on all subjects relating to the welfare of children. Of this he said:

During the five years the bill has been before Congress no valid argument has been presented against it. The chief reason for the failure of the bill thus far has been that it is solely in the interest of the conservation of human resources, and does not directly touch any material interest. It is therefore devoid of features which would win the advocacy of any selfish interest; and the persons who desire to continue to exploit the labor of children are naturally against it. It is a scandal to the American nation that our national government has proved so supine in doing what it can to promote the welfare of the children of the country.

Turning to New York state and especially Manhattan, Mr. Roosevelt came out flat-footedly that the state should "put a stop to manufacturing in tenements." New York leads in the amount of manufacturing carried on in tenement houses: The labor law contains no provisions to prevent the employment of children nor to restrict the working hours of minors or women in tenements. It provides merely that work on specified articles (forty-one in number) given out by manufacturers or contractors may not be carried on in a tenement living room unless the owner of the house has first obtained a license from the department of labor. To obtain such a license certain sanitary requirements must be satisfied. No one knows the actual extent of home work in New York city, as the inadequate force of inspectors of the State Labor Department cannot cover completely all the tenements where work may be carried on. The incomplete figures from the labor records show over twelve thousand tenements licensed for home work.

Mr. Roosevelt advocated a commission of inquiry. He said:

Actual experience has shown that under present conditions home work is a serious menace both to the workers and to the public. A home workshop is neither a home nor factory. The institution of the home from earliest times has surrounded itself with peculiar rights and traditions. To make it a "factory annex" is an invasion of the home which should not be tolerated. The home workshop is a factory without a closing hour.

All day the adults labor, with an occasional brief recess to look after the baby or attend to the most pressing household duties. After school and into the evening (sometimes until late) children of five years of age and upwards assist the grown-ups, in order to increase as much as possible the daily earnings. In many instances children of school age remain away from school entirely to work in the home. Home work and congestion, bad ventilation, and dark rooms go hand in hand. To permit women and little children to live and work in wretchedly lighted, badly ventilated rooms, polluted by overcrowding, both from the materials for work and from the workers, so that the air is contaminated, furnishes new recruits to the ranks of tuberculosis victims. Home work promotes truancy. School principals testify that the "system" constantly encourages the children to become "regular irregulars" in their attendance, and often chronic truants.

Since 1894 the state has attempted to control tenement-house manufacture by a system of regulation. Burdened by numerous other duties the labor department can now detail regularly for New York city only four inspectors, and periodically but twenty, to visit twelve thousand licensed tenements—known centers of home industry. In addition thousands of houses—no one knows how many—in which work may be going on without a license also need attention. Work on any one of a specified list of forty-one different articles can only be carried on legally in a licensed tenement. Present-day industry has overflowed into the houses to such an extent that over sixty other articles not mentioned in the law are now being made in tenement homes. For these no license is required, and work may go on under indescribably bad conditions, the output to find its way through channels of trade to the public. In short, the actual methods and possibilities of tenement house labor practically nullify the existing laws by rendering them impossible of enforcement.

The fact that the welfare of the workers is seriously menaced, that home life is broken up and that the public health is endangered through use of tenement-made articles makes imperative some action looking towards a remedy. Moreover, tenement house labor introduces unskilled and unsupervised work, including that of very young children, into competition with skilled labor in the shops, thus tending to reduce the proper wages of labor, and enabling unscrupulous employers to avoid the expense of shops and the necessity of submitting to supervision by encouraging piece-work in the tenement houses. Organized labor has a legitimate interest in this matter aside from the general interest. The first step should be legislative inquiry into this whole subject, such an inquiry as state Senator Wainwright's committee made concerning workmen's compensation.

The reasons for suggesting the appointment of a commission rather than the presentation of a bill are:

First, the information at present at hand,

while amply sufficient to show absolute need of immediate relief, is not as complete as is desirable for the purpose of laying a basis for the formulation of public opinion or of securing the enactment of the wisest provisions.

Second, only through the operation of such an official commission would it be possible to present to the courts, which later will be called upon to construe the provisions of any enactments, a collective body of evidence showing the reasons which moved the legislature to the adoption of the specific enactment, whatever form it may finally take. In this manner only, therefore, a wise and enforceable provision of law with regard to the evils dealt with can be assured.

Third, the Court of Appeals of this state held in the case *re Jacobs* that a statute forbidding manufacture of tobacco in tenement homes is contrary to the constitution, because not shown clearly to be a health measure. If we cannot secure, as we ought to, a flat reversal of this mischievous decision, then it would be well to obtain through a commission such convincing and comprehensive data as would exclude doubt of the immediate connection between work in tenements and injury to the health of the workers.

LEGISLATION NEEDED AS TO CONTINUOUS WORK

In equally trenchant words the speaker came out for the organization of working women; outlined the generous settlement made by mine owners and railroads after the Cherry disaster, roundly condemned the child labor permitted in western New York canneries, and the lobbying of the canners in defeating prohibitive legislation; backed up the bill for a fifty-four-hour week for women's work, which will be re-introduced next January by the State Federation of Labor; and called public attention, as the newspapers have in large part failed to do, to the effort to exempt the new supervising inspectorships in the Bureau of Factory Inspection from the civil service.

"It's mighty little use," he put it, "to have labor laws, if we let them be enforced primarily to give jobs to politicians."

To an extent, Mr. Roosevelt went outside his text to urge legislation regulating the hours of men in continuous industries. His point was that fatherhood no less than motherhood and childhood must be considered, that indeed, all three must be considered together, for the fundamental question is that of the family; and

women and children suffer if the men "are killed or crippled or labor under conditions which inevitably tend to brutalize and degrade them." He said:

The development of modern large-scale production has brought about a very rapid increase in the number of workmen employed in industries which are operated without stopping twenty-four hours every day for seven days a week. These continuous industries are new phenomena; just as factories with dangerous machinery were new phenomena. There must be new legislation, and new and enlightened methods of judicial interpretation of law, to meet the new conditions. To quote the counsel of the Factory Commission: "It has become increasingly clear that it is the duty of the state to safeguard the worker, not only against the occasional accidents, but the daily incidents of industry, not only against the accidents which are extraordinary, but against the incidents which are the ordinary occurrences of industrial life." In just the same way it has become the duty of the state to safeguard the worker against the "daily incidents" of a trade which takes the shape of inhuman toil.

With respect to this necessarily continuous seven-day work our old Sunday laws, dating back to an earlier generation, have broken down. Relief to the workers can be afforded only by increasing the labor force—one-seventh if necessary—to let part of the force off each day in the week and in that way giving every man one day of rest in seven. Legislation is needed to bring this about in this country, just as it has been brought about in France. And such legislation would be sustained by the courts unless they scuttled the logic on which the Sunday laws now on the statute books have been sustained; that is, as an exercise of the police power in protecting men from continuous toil. The supreme courts of practically every state in the union have gone on record as upholding Sunday laws, and in 1884 the United States Supreme Court expressed its approval of them "not from any right of the government to legislate for the promotion of religious observances, but from its right to protect all persons from the physical and moral debasement which come from uninterrupted labor." The priests and ministers and physicians of every mill town in America where the seven-day week governs could testify to how it undermines the comfort of their people, their happiness, and their health. At the present time, the progressive men in one big industry where it has been at its worst—steel—are tackling this seven-day schedule, and it looks as if they were going to be able to down it. The American Iron and Steel Institute has passed resolutions to that effect. So has the Federal Council of Churches of Christ in America, representing churches with a membership of thirty millions. It is high time we had six-day statutes and they were enforced.

In a continuous industry—whether it is a cement works or a trolley car, or a power

plant or a blast furnace, makes no difference—there are only two ways in which you can split up the twenty-four hours. There must be either two shifts of men each working twelve hours or three shifts each working eight. You can't compromise on nine or ten. You must choose between twelve or eight, and, with these two choices, surely the decision must be for the eight-hour day.

The workmen who put in the longest hours are classified by the New York State Bureau of Factory Inspection in a group labelled "sixty-three hours and over." That group includes roughly everybody above the ten-hour men—men who work anywhere from sixty-three to 119 hours per week. The report of this bureau for 1909 showed that out of 5059 workmen employed in the most important steel center in New York state, 4584 fell in this class. The majority of these men worked twelve hours a day either six or seven days a week. The same report shows that out of 12,991 workmen in paper and pulp mills in this state, 5650 worked over sixty-three hours a week. Out of 9543 employed in water, light, and power plants 2652 worked more than sixty-three hours per week. In all over 36,000 employes in the entire state worked a daily schedule of from ten to thirteen hours and over.

The effect of a twelve-hour day is paralyzing from the standpoint of the man's personal welfare, of his usefulness to his family, and of his usefulness as a citizen.

OHIO AND HER SOCIAL NEEDS

A state program was put forward by Rufus A. Longman of Cincinnati at the Ohio State conference of Charities and Correction this month in Toledo. President Longman urged additional institutions for special classes (inebriates, feeble-minded children, and the like), and the more thorough elimination of these classes from the general population, where they are a source of danger to themselves and others. The distinction of his address lay in his proposal to create a staff of visitors or parole officers for the purpose of extending the work of institutions for the insane outside of their walls in a system of after-care suggestive of the social service work which is being developed as an adjunct of general hospital administration in American cities. His recommendations included:

A law to compel fathers who fail to support their families to work on the public roads, their wages of \$1.50 per day to be applied to the support of their families; provision for special officers, somewhat in the nature of parole officers, employed by the

state, to look after the needs and make special arrangements for the after-care of the insane, subsequent to their discharge from the hospital; an institution for the treatment of inebriates; a state farm for vagrants and habitual beggars; provision for the proper care of the scores of feeble-minded children on our streets; and a law compelling every institution that cares for children to have a board of trustees.

What Mr. Longman said of the dull and troublesome boy applied in a general way in his consideration of the other classes taken up. He said:

In our physical ills, if our trouble be only one of the common ailments, we can safely entrust it to any well trained practitioner; but if our case be uncommon and the disease most threatening in its nature, we seek the most skilled specialist and pay him almost any price for his services. So in our social body we must not trust the weak, erring, and incorrigible to unskilled and untrained hands.

Social responsibility for prevention with respect to one group—the blind—was summed in a way applicable to other states by Dr. Louis Strickler, president of the Hamilton County Blind Relief Commission, Cincinnati. He said:

Twenty per cent of blindness is caused by infectious diseases. It is a matter of common observation that children, as a rule, do not contract these diseases until they start to school or until a brother or sister brings contagion home. The simplest and most effective way to prevent epidemics is school inspection, yet this is often opposed and resented by ignorant and prejudiced parents; nevertheless it ought to be regularly carried out in every school district of the state. Incompetent opticians, also, are responsible for much of the prevalent blindness; many of these opticians are men of little or no education and use only a grain of science and a ton of jugglery. . . . Syphilis is a prolific source of blindness, 25 per cent of it being attributable to this disease. The methods of controlling this disease have thus far been unavailing, but it is hoped that by education and instruction in sex hygiene, exemplified by the study of biology, knowledge can be imparted to every child without shocking its moral sensibility. . . . 14 per cent of blindness is due to accidents; and accidents are largely preventable. The use of defective materials in tools and the lack of proper guards in the machinery of factories are responsible for many accidents that issue in the loss or the impairment of eye-sight."

This, the twenty-first Ohio conference, brought six hundred and fifty delegates together, the largest number in the history of the body. In the words of a delegate, the conference drew the

scattered units of Ohio's social forces together and sent them back to their respective communities with added vital force and enthusiasm. Various current phases of social work were emphasized.

BUSINESS MEN AND CHARITIES

Edgar S. Adams, of the Cleveland Chamber of Commerce, saw in the endorsement of private charities by commercial bodies

the strengthening of the endorsed charity institution; the weeding out of superfluous and unworthy claimants; the prevention of fraud under the name and guise of charity; a bar to the establishment of new institutions where not needed; the increase of interest among business men, who are the greatest supporters; and the promotion of co-operation through the charity clearing-house.

This catalog of goods is so inclusive as to bespeak, in the minds of some social workers, the need at some later conference for a discussion of the effect upon the spirit and content of social work of "the business man in charity." What will be the affect in the course of a decade, they ask, of such dominance over the humanitarian agencies of a city by a local body of merchants and manufacturers? They point to the fact that the fresh enthusiasm of the 90's over the "business man in politics" has suffered considerable abatement. Both the constructive and negative aspects of the endorsement committee of chambers of commerce, in the cities where they are doing effective work, are being watched with interest.

Albion Fellows Bacon of Evansville, Indiana, brought the Ohio delegates face to face with the need for such a widespread state campaign on housing reform as that which she has instigated in the adjoining commonwealth. "The thing that holds back the housing problem is the ignorance of those who ought to help," she argued. "What we need is more publicity. People ought to know what is going on in their midst." She applied her gospel not only to the city but to the small town. J. M. Hanson of Youngstown set the complete destruction of slum districts as the goal to work for. Edward T. De-

vine of the New York Charity Organization Society developed a social worker's program centering in the significance of the social worker, the death rate, the fatigue test, and the character test in their vital relationship to conservation movements; all of these, he declared, are in harmony with the utmost development of our resources and opportunities.

Another current phase of charitable work was brought up by Alexander Jolinson, general secretary of the National Conference of Charities and Correction, who spoke on the Inadequacy of Relief, pointing out in the course of his address that, with the progress of the times and with the broadening application of scientific knowledge and the humanitarian sentiments, it is possible for the older leaders in charitable work to learn from the younger. His point was that material relief if doled out in niggardly fashion contributes to the making of paupers; the fear of giving unwisely, he held, should not hinder giving enough to relieve distress and to put the recipient in the way of permanent self-help.

PUBLIC OUT-DOOR RELIEF DISCUSSED

There was more extended discussion of the subject of public out-door relief—a subject which has been quiescent for a decade or more—at the New York Conference, held at Watertown, October 17-19. The proposition discussed was not to do away with such out-door relief throughout New York state, where it still exists, but to restore it in New York city, where it was abolished over thirty years ago. The chief paper was by Robert W. Heberd, secretary of the New York State Board of Charities, who contended that private out door relief was inadequate, especially in the case of widows, and that such relief was a proper function of government. Mr. Heberd said that from his experience as commissioner of charities for New York city he could hardly bring himself to recommend a return to the old system of public out-door relief, but he recommended that in suitable cases the private relief societies should have means

placed at their disposal from the public treasury under some plan whereby "the private societies would supply the machinery of distribution, rendering unnecessary the duplication effort, and keeping out all political consideration."

The discussion was opened by Frederic Almy of the Buffalo C. O. S., who declared himself opposed to any subsidies to private charities, no matter whether the money is disbursed by the charity itself or by the city on its recommendation, "because such subsidies lead to sectarian appeals, to lobbying, and to a scrambling at the public trough for patronage. These evils exist with subsidies to private institutions and would be more flagrant with the more easily abused out-door relief."

Public out-door relief exists in Buffalo, said Mr. Almy, and where it is inadequate, Charity Organization Society aid is sometimes given in the same family, but as a rule the more helpable families and more difficult families are referred to the Charity Organization Society, leaving the more chronic, unalterable ones to the city, as in London. Mr. Almy said that he is opposed to public out-door relief because it is never accompanied by an adequate staff to safeguard the relief and make it effective for good. He said that mere relief, apart from salaries, is more niggardly and inadequate for individual families with public charity than with private charity; and that public out-door relief went bare, without a plan, without a friend, and has nowhere developed the case committee, the constructive plan, and the volunteer visitor, which make charity flexible and personal. Where personality rather than control is of the essence, private charity is better than public. If private charity lacks the energy to find adequate relief it will lack the wisdom to use it.

Edward T. Devine denied that relief is a public function. He said the question is not whether private charity would like to have more money to spend, but whether public out-door relief would be beneficial. Public out-door relief would require at least a million dollars a year in New York city, and he firmly believed,

from ample experience in Berlin, in Paris, and in this country, that with it there would be more neglected poverty and distress than without it.

Mary Breed of the Albany Charity Organization Society said that her experience when in Boston was that with public out door relief politics would sometimes interfere with good constructive plans. Miss Florence Kelley spoke of the many widows whose children are now in asylums because both public and private out door relief are inadequate.

May Vida Clark, of the New York State Charities Aid, thought Mr. Heberd had hit the nail on the head in suggesting more cooperation between public and private relief, especially in small cities. Frank E. Wade of Buffalo, of the State Prison Commission, believed that the support of widows and children was a public function. He said he was optimistic enough to believe that with effort good citizens can reform public abuses.

CALL ON THE STATE FOR NEEDED ACTION

One of the strongest impressions made upon the mind of an observer at this twelfth New York State conference was the repeated insistent, and earnest call upon the state for action regarding conditions in which the conference was vitally interested and which only legislative enactment could remedy. This call was heard from the president's address at the opening session, through the papers on vagrancy, on child labor, on housing, on defective delinquents, to the report of the chairman on public institutions on the last day. Without favorable action on the part of the state, progress along the lines indicated was felt to be impossible. Dr. Max Landsberg of Rochester, president of the conference, received the progress made since 1900 in the understanding of charitable and correctional problems. He pointed out that the volume of problems, however, is constantly increasing, and that the growth in the number of offenders in institutions is out of proportion to the growth in population. To combat this danger, Dr. Landsberg recommended

the abolition of the county jail, state care of misdemeanants, a reformatory institution for boys between sixteen and twenty-one years of age who are guilty of misdemeanors, the establishment of a farm colony for vagrants, the completion of the New York Training School for Boys and of Letchworth Village, and the enlargement of the Training School for Girls at Hudson.

A plea for more liberal appropriations followed a depiction of the evil results of insufficient accommodation for the insane and for the feeble-minded, and of the beneficial results of carrying out the provisions of the permissive inebriety bill and of following an aggressive campaign for good housing and against tuberculosis. Dr. Landsberg closed his address by calling attention to the necessity of state supervision of private charities.

A memorial to William Pryor Letchworth, president of the first conference, written by Dr. Stephen Smith, was read by William R. Stewart of New York.

At the meeting of the Committee on the Care and Relief of the Poor in their Homes, Anna B. Pratt of Elmira, chairman, gave a graphic description of the evils arising from passing on wanderers from one town to another, and an account of the attempt to check this custom by use of a telegraphic code in investigation and by the cooperation of charitable societies throughout the country. The size of the tramp army, however, which she placed at 500,000, makes some other method necessary, if vagrancy is to be diminished and finally abolished. Three countries in Europe she said, have eliminated the tramp, the most remarkable remedy being the forced and free labor colonies of Switzerland. Twenty farm colonies may be needed to eliminate tramps in New York alone. Miss Pratt touched upon the evil of the half-charitable lodging-houses in connection with tramps and urged state lodging-houses.

The boy vagrant, it was pointed out, is one of the most serious phases of the tramp problem; therefore, the necessity for the school to compete successfully with the lure of the road is evident. The connection between study and the work of the world was taken up by Prof. A. D. Dean of Albany in a paper on

State Responsibility in Vocational Guidance and Vocational Education. Professor Dean indicated the threefold service of vocational guidance—personal, in relation to the child; social, in the investigation of industries with study of their relation to opportunity, health, and morals; and educational, to the community. One of the aims is to broaden the choice of work and safeguard the transition from school to work. Occupations for children are often deadening or temporary—fitting for nothing for the adult. The follow-up work with the employed children may result in compulsory part-time and continuation schools. Public opinion may be influenced toward the fixing of a higher compulsory school age based upon efficiency rather than years. Vocational guidance will help mold school life as preparation for working life and will make employment more educational. A proposed plan of the New York Department of Education is to have the school system begin to separate at the end of the sixth grade into three branches. After the elementary period, there will be a greater differentiation into (a) high school system, (b) business schools, and (c) industrial, agricultural, and home-making schools. State effort should cooperate with local effort for effective education.

Two forms of child labor in New York state, home manufacture in tenements and work in canneries were considered by the committee on this subject. Mrs. Florence Kelley, chairman, emphasized the impossibility of having effective inspection of the 1300 houses licensed for home manufacturing. Therefore the number of children working cannot be known nor the number of hours they work nor the conditions under which they work. Mrs. Kelley urged the appointment of a commission to investigate the subject of tenement house work, so that there will be a body of knowledge regarding the relation of the work to public health and to the health of children.

George A. Hall of the New York Child Labor Committee told of the evil effects on home and school life, and the danger to health through the

spread of disease. The possibility of doing work at home has increased the congestion of population and of traffic. Declaring that there are seventy-seven factories with 40,000 workers, in one block, he insisted that state regulation has proved inadequate and unsatisfactory. Prohibition of manufacture in living rooms seems the ultimate solution, he thought. In 1882, the law against the manufacture of cigars in tenements was declared unconstitutional because it was not clearly shown to be a health measure. The need now is for a mass of evidence.

The difficulties met with in the administration of the law and the need of more complete registration of births were pointed out by Pauline Goldmark of the New York Bureau of Social Research.

SEX INSTRUCTION AMONG MOTHERS

The necessity for earlier sex education and a "program for mothers," were emphasized by the Committee on Public Health, of which Dr. George W. Goler, Rochester was chairman. In outlining a program of sex education Dr. Ira S. Wile of New York stated that sex problems have two fundamental causes—temptation and will. This paper provoked the liveliest discussion of the conference. Society presents temptation, said Dr. Wile, through social evils and these evils can be remedied only by society. The will is individual. The development of the will of the child is largely within the power of the parents. The two influences at work on the character of the child are the home and companionships. Dr. Wile therefore advocated that the sex instruction be begun in the home at the time of the child's first questions, and that an intellectual morality be established. Otherwise the child will obtain piece-meal information elsewhere and the confidential relationship between mother and child will break. Dr. Wile noted three age periods—the age of mythology, of chivalry, and of civic awakening; each period needs its special kind of instruction.

That the intimate relation of the obstetrician to the prospective mother can

and should be made the means of her education in anatomy, physiology, and hygiene, was the view of Dr. Paul T. Harper, of Albany. Dr. Harper described the need of regulation of the practices of midwives.

A program for remedying the housing evils which every city has was suggested by John Ihlder of New York, showing existing conditions to public-spirited citizens, a social investigation for assembling facts, and then the passage and enforcement of proper legislation might be appropriate steps, said Mr. Ihlder, in such a program. Three features of law enforcement were declared by John J. Murphy, New York tenement house commissioner to be the education of the public, prosecutions, and the vacating of dangerous houses. To the ignorance and apathy of the public Edmund J. Butler of New York ascribed the existence of privy vaults and their attendant evils. The need for housing laws was declared to extend to second and third class cities.

A committee of the Prison Association of New York has recently been formed to study the defective delinquent and to secure legislation for their proper custodial care. Feeble-minded criminals said Dr. Charles Bernstein of Rome, do not belong in a reformatory institution for normal boys and are a hinderance to the work for the brighter boys. As present laws do not permit the transference of defective delinquents to custodial asylums; they are ultimately returned to the community, where they usually fall again into crime.

Urging that children should be kept in real homes—not make-shifts maintained on charitable pittances, with children necessarily neglected by working mothers, nor homes that menace health—Dr. Ludwig Bernstein of New York, chairman of the Committee on Children, declared that commitment and placing out should nevertheless be regulated by the age of the child, by its health, former environment, and education. In this connection the large opportunity for molding character enjoyed by the "cottage mother" was pointed out by Dr. Charles H. Johnson of Albany.

Peculiar physical, mental, and temperamental traits are necessary for efficiency in that work, he thought. Efficiency, he said, was the ability to get results.

SEASIDE PARK AND HOSPITAL SECURED

Another "Seven Years' War" is ended. Last week the New York Board of Estimate and Apportionment voted to condemn the 250-acre site on Rockaway Beach, and this will now be made into a seaside park for the city. The Association for Improving the Condition of the Poor will immediately carry into effect the purposes of the funds raised for an enlarged hospital for crippled children, the first of several health institutions planned for the tract in addition to its use as a recreation beach. It is hoped that condemnation proceedings may be completed so as to allow this work to be begun before snow flies. The board acquired also the Dreamland site of seven acres at Coney Island, and this, too, will be made into a park.

For the Rockaway Beach property \$1,225,000 will be paid, and for the Dreamland tract \$1,000,000. It was stated at the meeting of the board that these sums are only a portion of about \$5,000,000 which is to be spent by New York City in the near future for seaside parks.

The purchase of the Rockaway Beach property for a city park has been urged for seven years. In June, 1904, Charles B. Stover pointed out¹ that this was the only remaining site which the city could turn into a large ocean park. Combating the argument that the place was inaccessible to New Yorkers, he thus early staked the moral claim of the city to the wonderful beach front.

The project has been alternately revived and lost sight of for several years.² The Dreamland fire at Coney Island last summer seemed a suitable moment to revive the plan, and the Parks and Playground Association took it up. A special Committee on Seaside Parks, representing numerous civic bodies, was

¹See *Charities* for June 4, 1904.

²See *THE SURVEY* for Aug. 12, 1911.

created, with Jacob A. Riis as chairman. This committee has been laboring all summer to put the matter through, Mr. Riis putting the fire into it with which he attacked Mulberry Bend years ago.

The citizens' committee lost two of its members by death during its sessions, the Very Rev. William J. White, of Brooklyn, and the Rev. Dr. John B. Devins. In taking leave of his associates on the committee last week, Chairman Riis expressed the hope that the securing of this park and hospital will be "the beginning of a benefaction which will extend its chain of hospitals in the coming years down the whole Atlantic coast, as has already been done in France and England." He said also:

We should not forget, in the rejoicing over victory, Charles B. Stover, who years ago laid the foundation deep for the success of today, and the city officials who have been most helpful from the beginning: Borough President George A. McAneny, Comptroller William A. Prendergast, President of the Board of Aldermen John Purroy Mitchel, and Vice-president Francis P. Bent, President of the Borough of Queens Maurice E. Connolly. They all deserve the gratitude of the people.

ON FIRE AND OTHER FACTORY HAZARDS

The Factory Investigation Commission, created by act of the New York legislature last July, has held its first hearings. The commission had its origin in the need for new fire legislation which was brought out so tragically at the Washington Place factory fire last winter; but its scope includes all "existing peril to life and health of operators." The legislative members of the commission include the democratic leaders—of the two houses of Congress—Senator Robert F. Wagner, chairman, who is chairman of the commission, and Assemblyman Alfred E. Smith—also Senator Charles E. Hamilton, Assemblymen Cyrus W. Phillips, and Edward D. Jackson. The four members appointed by the governor are Mary E. Drier, of the Women's Trade Union League, Samuel Gompers, Simon Brentano, a member of the Fifth Avenue association, and Robert E. Dowling, a real estate agent. At the opening session Abram I. Elkus, attorney for the commission, outlined

the commission's aims, scope and plan of work.

The investigation of fire conditions is under the direction of H. F. J. Porter, who with three assistants will make a study of representative buildings in the factory districts of New York city, with Fourteenth street as a center. The investigation of sanitation, including occupational diseases, will be in charge of Dr. George M. Price of the Joint Board of Sanitary Control of the Cloak-makers' Union.

Dr. Price's investigations will cover the printing trades, tobacco, chemicals, four food industries (ice cream, candy, pickling, and baking), and the work of women in the manufacture of paper boxes, human hair goods, artificial flowers, and feathers. Seven inspectors will be employed, two of them physicians. One hundred bakeries will be visited at the night shift, and from twenty-five to fifty factories in each of the other trades will be covered. The inquiry will be limited to sanitation and ventilation. With Dr. Price's report on these industries will be included the result of an investigation of sanitation carried on under the direction of Pauline Goldmark of the Bureau of Social Research, a report by John B. Andrews on lead, phosphorus, and mercury poisoning in New York state, and material on sanitary conditions in the garment trades gathered by the state Department of Labor and the Joint Board of Sanitary Control of the cloak- and suit-makers' Union.

FACTS BROUGHT OUT AT PUBLIC HEARINGS

These investigations by experts and the deliberative sessions on their results will undoubtedly, as in the case of the Illinois Commission on Occupational Diseases, be the most important part of the work of the commission. Popular interest is being attracted and some interesting testimony will be offered at the public hearings. Much of the first three days' testimony was a repetition of facts already familiar through the coroner's inquest after the Washington place fire. The public officials were more clear-cut,

*See THE SURVEY, October 7, 1911.

however, and definite in their recommendations for lessening the hazard to life from fire. From the fire department former fire-chief Edward Croker and the present chief, John Kenlon, testified, the latter reporting on an investigation of fire conditions he had caused to be made in the last two months, which brought to light 1,032 violations of building code regulations, 607 violations of charter provisions in regard to extinguishers and alarms, 401 violations of fire regulations of the Department of Labor, twenty-nine of the tenement house law, and twelve of the sanitary code—altogether 2081 violations, none of which the fire department was given the power to correct. Mr. Kenlon's first recommendation was that such power be given his department, with the right to hale violators to court. As fire preventives he recommended automatic sprinklers in all manufacturing buildings without exception, fire towers for low buildings and fire walls for high, the absolute barring of wooden partitions, and the strictest possible enforcement of regulations against dirt and rubbish.

Mr. Kenlon stated that there are between two and three hundred buildings in New York at the present time whose fire conditions are like those which existed in the Asch building. In support of his statement he offered to put a list of addresses in the hands of the commission.

The recommendations of Rudolf Miller, superintendent of buildings, differed in some respects from those of Chief Kenlon. He was in agreement in urging the necessity of giving the fire department inspecting power so that it could force the remedying of violations, but he believed the best way to achieve the latter was to give the Building Department power of summarily vacating the offending building. The chief handicaps of his bureau are, he stated, the necessity of bringing suit in case the owner does not remedy a violation, the distribution of responsibility among many departments, the inadequate number of inspectors, and the lack of power to reinspect buildings except on complaint. As an illustration of the cumbersome process of enforcing the remedying defects he said that

the bureau now had 2500 fire-escape cases on hand. Many of these are on complaints sent in since the Asch fire, some, however, are cases that have hung fire for many months, some even for years. His chief structural recommendations were balanced stair ladders where outside fire-escapes are necessary, but, as infinitely preferable to such means of exit, a system of inside smoke-proof staircases proportioned to the number of persons in a building, with fire walls bisecting high buildings.

He urged the strict limitation of the number of occupants permitted in a building in the same way that we to-day regulate the weight that may be put on a given floor. He advocated a certificate of occupancy. Deputy Inspector H. L. Schnur, who represented the Department of Labor, recommended the weeding out of old and inefficient inspectors from that department, voluntary reports from high-grade establishments which would release the time of the staff to concentrate on bad and indifferent factories. Among others who testified before the commission was Leonora O'Reilly, organizer of the Women's Trade Union League, who described and showed photographs to illustrate fire and sanitary conditions in several paper-box factories she had recently visited. One of these buildings had formerly been occupied by a firm of cloak-makers, whom the Joint Board of Sanitary Contract forced to move from their dangerous quarters by the simple and effective method of the strike.

HOEY - SULLIVAN BILL BECOMES LAW

At the opening of the hearings no bill to remedy fire conditions in New York city had as yet become law. On October 19 the Hoey-Sullivan bill was signed by the governor. This bill empowers the fire commissioner to order the remedying of violations or inadequacies in means of exit and to order vacation of buildings in which imminent peril to life exists through such violation or inadequacy, though the owner is given the right to appeal against such an order to a board of survey. The bill also establishes a Bureau of Fire Prevention.

These changes are, as Fire Commissioner Joseph Johnson is quoted as saying, revolutionary in sound but worth little unless public opinion is brought to bear to secure an adequate appropriation from the Board of Estimate and Apportionment. Advocates of the reform point out that the postal forwarded to Albany by the secretary of the commission on the lack of authority in departments to correct the dangerous conditions shown by Fire Chief Kenlon's report hastened the signing of the new bill. The fact that the commissioner is to resume its sittings in New York in a few weeks may have a like effect on the appropriation.

The Commission will present a report to the legislature on February 12, and will then ask for an extension of time to carry on more intensive investigations. For, while those who are following its hearings appreciate the results thus attributed to the publicity it has given imperative needs, the responsibility of the commission itself reaches deeper into making fundamental and constructive investigations as a basis for permanent action.

CANADIAN CONFERENCE MARKS NEW ADVANCES

"Though the history of her civilization stretches back three hundred years, swaddling-clothes still wrap her social problems"—this is characterization by a delegate to the twelfth annual Canadian Conference of Charities and Correction which met this fall in Hamilton, Ont. To his mind a new, wider, more national interest in social work is manifesting itself. For the first time delegates came from the east and west of Ontario. It was a dominant note of the conference that Canada, with a population of eight millions, still largely rural, and with its industrial development just beginning, has the opportunity to avoid the blunders of countries where industry is older and city life more complex. Yet facts were brought out showing that this opportunity is being missed; that the problems are outgrowing their swaddling-clothes; that bad housing, over-crowding, high death rates from preventable diseases, deser-

tion, and non-support are appearing in Canadian cities, and that only a start has been made in effective remedial effort or preventive legislation. Institutional care has been largely developed, but agencies for prevention are few. An encouraging sign was the presence at the conference of a number of city officials, especially those connected with the police and charitable departments. There was response to the address of James F. Jackson, superintendent of charities and correction of Cleveland, O., when he said that in the cities social and economic questions come to the front and come hard. This was at a Sunday afternoon meeting given up to a discussion of the closer co-operation of the churches with charitable agencies. The point was carried further by Samuel Arnold, secretary of the Associated Charities of Toronto, Ont. The increasing perplexities of the immigration problem in Canadian cities were revealed by Edith Elwood of Evangelia settlement, Toronto, to whose mind there will be need for active neighborhood work in every city in the Dominion in the next few years.

Not only city problems but questions of law and administration dealing with the social responsibilities of the provincial governments were emphasized. The decision to hold the next conference in Montreal at the time of the Child Welfare Exhibit there was significant in this connection. Ontario has taken a position of leadership hitherto in securing cooperation among the social and charitable agencies. The mid-western Canadians have been the pioneers in their collective assault on public opinion. For the first time the conference will be held outside of Ontario, and it is hoped by this move to enlist the cooperation of the sister province of Quebec.

The discussions of feeble-mindedness and wife-desertion illustrated the active trend of opinion with respect to provincial and dominion legislation. Out of the former discussion sprang a resolution which declared that many of the inmates of Canadian jails, prisons, hospitals, houses of refuge, and charitable institutions are abnormal, and that many backward children in the public schools need

special education. The resolution, which was carried unanimously, called for the appointment of a commission of five or more persons—to represent the conference, the Ontario government, and the general public—to frame a definite plan to deal with the whole question. In the opinion of J. P. Downey, superintendent of the Hospital for Feeble-minded at Orillia, there are 6,000 feeble-minded persons in Ontario who should be cared for in institutions where the sexes could be segregated.

Staff Inspector Kennedy of the morality department of the Toronto police gave as the four chief causes of wife-desertion drink, gambling, double living, and the interference of friends. "Cures" applied by the morality department he described as one week in prison to sober and think, then supervision for a time, and weekly collections of money for the family's support. Immediate need for revision of the criminal code on this subject was pointed out by J. Howard Falk of Winnipeg. Punishment should be made adequate, he declared, the marriage tie should be recognized legally as binding the husband to provide for his wife and offspring, unless adultery has been proved against the wife, and the authorities should be enabled to follow up deserters who leave their province.

J. J. Kelso, of Toronto, broached the problem of the pensioning of mothers in its bearing on the wife desertion problem. He thought that many parents shirk their responsibility towards the family because the law too easily allows children to be placed in institutions. He held that "instead of forcing the mother to go out to work for the support of her children she should be paid to remain at home and take care of them when she showed a disposition to do so. It would not cost half so much as it does now to maintain them in orphanages and reformatories." A committee of which Mr. Kelso is chairman was appointed to consider legislation dealing with this matter.

CONSOLIDATION OF NEGRO AGENCIES

A new stage in constructive social work among negroes may result from

a re-organization of agencies affected last week. Three organizations—the Committee for Improving the Industrial Conditions of Negroes in New York, the National League for the Protection of Colored Women, and the Committee on Urban Conditions Among Negroes—have consolidated and formed the National League on Urban Conditions Among Negroes. The membership of the new league consists of equal representation from the membership of the three organizations.

The objects of the league are:

To carry on constructive and preventive social work among Negroes, for improving their social and economic conditions in urban centers; to bring about co-ordination and co-operation between existing agencies working in the interests of Negroes, and to develop other agencies where necessary; to secure and train Negro social workers; to make such studies in cities as may be required for the carrying out of the objects of the league.

The officers are:

Prof. E. R. A. Seligman, chairman; Dr. Wm. L. Bulkeley, Mrs. Wm. H. Baldwin, Jr., and Jacob W. Mack, vice-chairman; Edward E. Pratt, secretary; A. S. Frissell, treasurer; L. Hollingsworth Wood, assistant treasurer.

The executive committee consists of the officers and:

Paul D. Cravath, Prof. Felix Adler, and Frances A. Kellor, from the Committee on Urban Conditions Among Negroes; Dr. E. P. Roberts, Mrs. E. B. Leaf, and Mrs. Haley Fiske, from the National League for the Protection of Colored Women; the Rev. Wm. H. Brooks, Abraham Lefkowitz, and the Rev. S. H. Bishop, from the Committee for Improving the Industrial Conditions of Negroes in New York.

Prof. George E. Haynes, of Fisk University, Nashville, is director of the new league, and E. K. Jones is field secretary in New York. Branches of the national league are being organized in Baltimore, Memphis, St. Louis, Nashville, and Louisville, and others will be started soon. These committees will carry on work similar to that done in New York by the Committee on Urban Conditions Among Negroes which was organized largely through the efforts of Mrs. Wm. H. Baldwin, Jr. During the present year this committee had made a preliminary survey of the Harlem district, conducted the work of a Central Bureau of Negro Fresh Air Agencies,

supervised all of the fresh-air work among Negroes in New York during the last summer, and maintained a camp for colored boys at Manorville, L. I. The National League for the Protection of Colored Women, which established stations in Philadelphia, Memphis, Baltimore, New York, and Norfolk, has kept a list of reliable employment agencies, maintained amusement clubs for women, and carried on probation work. The Committee for Improving the Industrial Conditions of Negroes in New York has had as specific objects the promotion of education, the development of employment agencies for artisans, and the co-ordination of social work among the Negro districts of the city. It has been successful in securing the extension of public night schools for industrial training.

The plans of the new league include surveys of all the districts inhabited by the 70,000 Negroes of Greater New York, the organization of a chain of colored boys' clubs throughout the city, and the holding, on Dec. 4, of a city conference of Negro Social Workers,—the first ever held.

DUST, BABIES, AND DISEASE

The details of a series of experiments into the manner of the spread of infantile paralysis, conducted by Dr. Marcus Neusteadter of New York city and Dr. William C. Thro of Cornell Medical College, were described before a recent meeting of the New York Academy of Medicine. Specialists present commended the experiments as an epochal advance in the medical knowledge of the disease. Six monkeys had been used, and the results obtained were declared to indicate, first, that the disease is eminently an infantile ailment and prevails principally among the very youngest children, those who play on the floor; second, that the disease is one which occurs mostly in the dry season; third, that the character of the neighborhood and living premises in which it is found does not play a material part in its spread—that, in fact, it may occur anywhere; fourth, that children in the same family may be attacked one after the

other and that in a given house children may be attacked in different families in fairly quick succession and along the lines of neighborly communication; and, fifth, that the upper air-passages appear to be the channels of the infection.

During March the two experimenters collected the sweepings, of from three to six months' standing, from rooms where nineteen different cases of infantile paralysis had occurred. These were dried for several days, then sifted, macerated in a normal salt solution, and filtered through paper and a Berkfeld filter. This solution, after it had been kept on ice for six days, was injected under the outer lining of the monkey's brain. An injection into the spine of the monkey was made a few days later from the nasal discharges of nineteen human patients. There were no noticeable results from either injection. Similarly the second and third monkeys received injections, except that the dust extracts were from sweepings of six weeks' and two weeks' standing, respectively. The autopsies again revealed no satisfactory evidences of infantile paralysis.

The sweepings of a case of one week's standing, after being shaken constantly for six hours with one hundred cubic centimeters normal salt solution evaporated to a consistency of five-sixths, were injected into the brain of the fourth monkey. This animal gave evidences of the disease, but recovered. A fifth monkey received into its spinal canal five cubic centimeters of sterile water in which had been macerated sweepings from a room where a four-year-old child had been stricken and had been paralyzed in two days. The monkey seven days afterward showed positive evidences of the disease. Then the fourth monkey, which had given results of no value from sweepings, and a sixth animal, were injected with a culture from the fifth. Both became violently ill and showed positive signs of infantile paralysis. From these results the physicians drew conclusions pointing to the belief that room dust is a medium through which the virus of infantile paralysis spreads.

Dr. Rosenbluth, after observing 117 cases of the disease at Beth Israel and Mount Sinai hospitals, and taking pains

to learn the original diagnosis of each case, found that in 65 per cent of the cases the diagnosis had characterized the disease as of the upper air-passages, and in 35 per cent as of the intestinal tract.

EDITORIAL GRIST

MEDICAL CHARITIES IN JAPAN

ALLEN K. FAUST

The Emperor of Japan some months ago issued a very important rescript which, freely translated, reads as follows:

In consequence of present-day conditions, it is necessary to enhance our people's welfare. Economic changes are slowly taking place. At such a time the mind of man is prone to go astray. The government ought most carefully to consider this and make strenuous endeavors to advance industries and to further education, so that healthy progress may result. If there are dependent ones among our people, who for the lack of medical attention are allowed to die before they have reached their natural limit of life, such have our deepest concern and sympathy. We hope, therefore, by means of free dispensaries and free medical treatment, to open a way for their relief. To this end, we contribute from the Privy Purse an amount of money (1,500,000 yen) as a foundation. Follow out our wishes by investing it securely and applying it effectively, so that for a long time it may be the source of help to many people.

Upon the announcement of this imperial munificence a movement was at once started for soliciting additional subscriptions from Japanese men of wealth. Prime Minister Katsura invited many rich men to his home and appealed to them for contributions. An association was organized called Saiseikwai (Life-restoring Association), to devise plans for carrying out the emperor's instructions. Prince Fushimi has been appointed director-general of the association and Prime Minister Katsura is its president. The result of this work has been that about 20,000,000 yen have been subscribed, with a possibility of the final amount reaching 30,000,000 yen. The details of the plans have not yet been made public, but it has been suggested that tickets for

free medical treatment be issued to the sick among the very poor, and that special consideration be given to the sufferers from tuberculosis, syphilitic diseases, trachoma, and the like.

The strong family system of Japan has been an immense asset to the country, whether considered economically or as a means of social control. Public opinion in this connection has been so powerful that poor relatives could hardly be neglected with impunity. But the introduction of ideas from the West without corresponding social institutions and the great economic pressure under which a large part of the population is patiently living have made the former family charity totally inadequate. Those in authority are keenly conscious of this situation, and the Life-restoring Association is an opportune product of the needs of the new times. According to some Japanese papers, it is also believed that the present movement for a larger philanthropy will go far to prevent any further cropping out of anarchistic tendencies.

There is pressing need in Japan for the new philanthropy in behalf of the sick among the "submerged tenth." The country is far advanced in the science of medicine, but the beneficent influence of the healing art has not yet been socialized, has not yet permeated down to the lower strata of society.

Tuberculosis is in Japan, as everywhere, the most destructive of the enemies of society. According to the latest official statistics, published in August of this year, 133,000 persons are annually sacrificed to the tubercle bacillus. This is an average of about twenty-seven persons to every 10,000. The whole number of patients is of course many times more than the number of deaths. Up to the beginning of the present movement, practically nothing had been done, in a public way, for the relief of the dire distress caused by the great white plague. Japan is, therefore, to be congratulated upon the forward step which she has now taken. There are also good reasons to believe that the government will not allow this movement to cease until an adequate solution of the problem shall have been found.

Sendai, Japan, August 24, 1911.

LABOR LEGISLATION IN NEW YORK

PAUL KENNADAY

New York Association for Labor Legislation

Between the chief court of the state on the one hand, and the chief executive of the state on the other, Labor Legislation in New York has had about as much chance for progress in the past year as the poor camel when he found himself looking into the eye of the needle. The Court of Appeals has held fast to an interpretation of the law from which there is no escape except through the laborious process of constitutional amendment, if New York is to have even such a circumscribed Workmen's Compensation Act as that proposed by the recent Wainwright Commission. However, the people of New York were given their day in court and now their remedy is at least in sight; if still long deferred.

It remained for the governor, ably seconded by the majority of the Civil Service Commission, when every consideration of right public service called for deliberation and publicity, to put in the way of labor an obstacle well fitted, if not well devised, to halt its progress for many years to come. Practically reorganizing the Department of Labor and enlarging the inspectorial force from sixty to eighty-five men and women, providing for a division of the State into seven industrial districts over each of which was to be placed a supervising inspector with large power and incalculable opportunity for good or evil to the great mass of industrial workers of the state, the Phillips law seemed a triumph of legislation. But in the dog-days of July, up at Albany, the State Civil Service Commission quietly took the starch out of this new law. On July 25, it received a communication from the Commissioner of Labor asking to have placed in the exempt class the eight supervising inspectors whom the Wainwright Commission had specifically recommended should be under civil service control. Two days later it received and without more ado adopted the commissioner's request when submitted in a phraseology in conformity with

the rules and regulations of the commission. Then and there Messrs Kraft, Burton, and Ludvigh, under oath to enforce the law that appointment to the public service wherever practicable shall be by competitive examination, concluded upon the mere reading of this stereotyped request to put these inspectors in the exempt class, to open wide the door of political influence, and to slam fast the door of promotion in the faces of inspectors tried out in the ranks and proven worthy. Without previous notice to the public, without opportunity to be heard given to those known to be interested, without inquiry or knowledge of the facts, without argument advanced, with no single witness before it, the State Civil Service Commission recommended the exemption of these supervisors. The governor so ordered and all was ready for the office-seekers.

Then appeared an eager throng, some out-and-out Job hunters, others good and "practical" men, the kind "who know all about machinery even though they can not pass a college examination." The clamor of those so anxious to serve their fellow men at \$2,500 per year grew, and as it grew first gave the warning of what had been accomplished in the quiet of the summer days. The Consumers League, the Civil Service Reform Association, the Child Labor Committee, and such like "pestiferous fellows" took alarm, the commission upon request held another Albany hearing somewhat more heated this than that of July—charges were made and indignantly denied that the former meeting had been in effect a secret one and the curtain went down with Commissioner Williams holding the center of the stage, and declaring that upon assurance of written notification from the commission of a public hearing in the City of New York on October 31 he would postpone until after that date the appointments which the commissioners and the governor had authorized him to make.

The last act in this sorry farce takes place next week; the scene shifts to the rooms of the Municipal Civil Service Commission; all the actors crowd upon the stage, each to say his say

with the chorus watching angrily to see whether these public servants will give judgment in favor of those needing more efficient administration of the labor laws, in favor of the over-worked man, the under-aged child, the under-paid woman, —the lady or the tiger.

THE PAROLE OF LIFE' PRISONERS

GEORGE W. WICKERSHAM

Attorney General of the United States

Considerable thought and discussion has been devoted to the question whether or not the benefits of the parole law should be extended to life prisoners. The committee of the National Prison Association having this subject under consideration at its last annual meeting advocated, within limits, the extension of the parole law to life prisoners who, according to expert judgment, are safe to be at large, whose offense was born of an overmastering impulse, and whose previous record was not vicious. The statutes in some of the states make life prisoners eligible to parole when they shall actually served a long term of years; such as thirty-five years less good time allowances in Minnesota; twenty-five years in Montana, Nebraska, Ohio, and Utah; fifteen years in Louisiana and Virginia; ten years in Texas and seven years in California. Under the federal statutes, a prisoner sentenced to thirty years' imprisonment for rape; to twenty-one years' imprisonment for assault with intent to rape; one sentenced to twenty-one years' imprisonment for kidnapping or to ten years' imprisonment for manslaughter, are all alike eligible to parol. Probably no greater moral dereliction is involved in the commission of the crime of murder in the second degree, for which a life sentence is imposed, if as much, as in the crime of rape; and if the law-making power considers reformation, conditional liberation, and reinstatement to a normal position in society possible in the case of one who has been convicted of the terrible crime of rape, which may be punished

by a term of imprisonment so long as to be practically equivalent to a life term, it is difficult to say on what principle the same possibility and hope of reformation, liberation, and forgiveness should not be extended to one guilty of murder under circumstances not punishable by death. While there is life there should be hope. It may be far off, delayed, a dim, distant possibility, but it would seem that that hope should be held out as a possible attainment to the meanest wretch who is allowed to live. The justice of man should aim at the perfection of divine justice; and though finite wisdom, not knowing the hearts of men, may not always deal justly with offenders, yet it should not "Shut the gates of mercy" against the meanest of God's creatures.

TREND

That the third scientific study of elimination and retardation in our schools to be made in four years has just come from the government printing office at Washington, D. C., attests the wide interest felt today in the efficiency of our public systems of education. In adding another study to the former two the government has, as it were, "had another say." The first was a monograph by Prof. Edward L. Thorndike, of Columbia University, entitled the Elimination of Pupils from School, published as Bulletin No. 4 (1907) by the Bureau of Education. A spirited discussion of this work was succeeded by the publication by the Russell Sage Foundation of Laggards in our Schools, a study of Retardation and Elimination in City School Systems, prepared by Dr. Leonard P. Ayres. The third in the field is published as Bulletin No. 5 (1911) of the Bureau of Education, and is called Age and Grade Census of Schools and Colleges, a study of Retardation and Elimination. It is prepared by Prof. George D. Strayer, of Teachers' College, Columbia University. Prof. Thorndike used reports from twenty-three cities, Dr. Ayres from fifty-eight, and Prof. Strayer from 318. One conclusion reached by Prof. Strayer is as follows:

"The study of the problem of elimination and retardation has brought us face to face with the necessity for changing our curriculum. It is manifestly unfair to provide a rigid curriculum which leads straight to the college or the university. Our schools are beginning to take account of the facts of individual differences in interests and in abilities. We shall have to modify our curriculum still further. During the first six years we may

¹From the Attorney-General's address last week before the American Prison Congress in Omaha.

possibly be satisfied to accept a minimum of achievement from those who are less capable along the lines of traditional school work. Beyond the sixth grade we are already beginning to have a differentiation of courses of study which will enable the child who is to work in the fields of industry or commerce to secure from the school some adequate preparation for his lifework. We are beginning to have, and shall have probably in still greater measure, special schools and special classes for those who are unusually deficient either mentally or physically. It is not less significant that special classes for unusually capable children are beginning to be established. The ideal of education in a democracy will be realized when it is possible for each child to work to the maximum of his capacity and to secure during those years devoted to school activity that training which will best fit him for his life's work."

A defect in school records is pointed out by former Commissioner E. E. Brown in his letter of transmittal:

"It should be added that in our statistical studies of school attendance we shall continue to be in the twilight, though not altogether in the dark, until a practicable method can be devised for keeping a separate record throughout his school course of each individual pupil, whether he remain in one school or follow the widespread American custom of migration."

Other interesting studies have been issued this year by the Bureau of Education. Agencies For The Improvement of Teachers in Service, by Prof. William Carl Ruediger, of Teachers' College, George Washington University, is the title of bulletin No. 3. Besides a mass of material suggested by its name this monograph contains sections on Measuring Teachers' Efficiency, Participation of Teachers in the Determination of Educational Policies, etc.

Bulletins 10 and 11 of the same Bureau are, respectively, a bibliography of education for 1909-10, and a bibliography of child study for the years 1908-1909.

* * *

The *Atlantic Monthly* and *McClure's*, for October, contain matter of the keenest human interest. In *Within the Pale* a Russian Jewess (Mary Antin) begins her story of her own life. The first chapter is preliminary. It gives the environment in Russia of this people set apart for continual espionage and periodic persecution, and the race customs within the *Pale*, where fear of persecution has dulled romance, and young people are brought together for marriage without choice, to bring into the world such brave stoics, and withal idealists, as Mary Antin promises to be.

The story in *McClure's*—*Tragedies*, by Estelle Sturgis—is the story of a young girl's part in the hand-to-mouth life of a mechanic's family. "Grief," says the girl, "is a month of sobs and tears; sorrow is a dear memory buried away and taken out at times to caress and cry over; a tragedy is a hurt that leaves

a scar on the soul." The girl's tragedies are three—when she loses the last dollar that lies between the family and hunger; when the unaccountable shame of begging that goes with real poverty prevents her from asking a willing neighbor for the fruit her sick mother needs, and when she learns something about her mother's early life that revolutionizes her whole idea of her. These are the three scars in her life, told with strong and simple pathos, that "last until death, and pale and burn under strong emotion."

* * *

A hint to the N. Y. Interborough—which needs the hint sadly—comes in the report from the American consul in London of the efforts being made to purify the impure and stifling air of the "tube" by pumping daily 80,000,000 cubic feet of ozonized air through its tunnels. This, it is estimated, will give 900 cubic feet of air per person per hour, which is 600 feet in excess of the ordinary allowance per person in buildings. Plants are to be erected at each station. Only one is as yet in use. Its operation is thus described: "The air is drawn from outside through a filter screen, which removes dust and dirt and impure gases. A part of the air is then highly ozonized by being passed over highly electrified plates, the proportion of ozone in the whole being one part in 10,000,000. The air is driven by fans to the level of the bottom of the station, and two-thirds of it is distributed over the platform by ducts, with outlets at a height of seven feet above the platform. The remainder is driven into the tunnel. The size of the pumping plant is such that it can be installed in a chamber ten feet by eight feet by four feet, and there are two miles of duct work."

* * *

Convinced that the growing demand for information concerning the results of vocational school experiments calls for a new educational publication, the Manual Arts Press, Peoria, Ill., began the publication in September of a bi-monthly periodical, *Vocational Education*. The first issue contains an article on Vocational Training and its Future, by Edmund J. James, president of the University of Illinois, and other signed articles on the Cleveland industrial school and the Illinois state reformatory school. The editorial-staff is made up of experts in technical training. The editor in Chief is Charles A. Bennett, of the Bradley Polytechnic Institute, Peoria. Among those on the advisory board are Charles R. Richards, director of Cooper Union, and Meyer Bloomfield, director of the Boston Vocation Bureau. According to present plans the periodical will contain articles written not in popular style but for specialists in the subject, giving practical and suggestive data about types of vocational schools and on courses of instruction. The magazine also contains news items, book reviews, and an editorial department. The subscription price is \$1.50 a year.

* * *

The *Delineator* for November begins a delightful series of interpretations of the boy

by Carl Werner. In the Hunt for the Man in the Five-year-old, Mr. Werner, who has, says the editor's note, the originality and sweetness to remain a boy at heart through life, analyzes discursively and picturesquely those characteristics which to him mean that the end of babyhood comes at five, and with it the waning of the mother's and the beginning of the father's domination—provided through lack of time and interest the father does not lose his opportunity.

* * *

In *McClure's* for October J. Adams Puffer, director of Beacon Vocation Bureau, analyzes a later stage of the boy's development, the gang age, from ten to sixteen. The gang-boy admires the leader; so does Mr. Puffer, and for the same reasons. As result of his study of thirty-one leaders and thirty-seven easily led boys in the Lyman School, Boston, he pictures the leaders as starting in at school in grades ahead of their age and forging ahead through school at a rate even out of proportion to their original start. The characteristics of the leader are strongly hereditary but not incapable of being developed by training. Mr. Puffer holds that there is an intermediate group of boys between the actual leaders and the naturally led in whom the gang—the proper kind of gang, that is—can develop qualities of physical vigor, mental capacity, reasoning, strength of will, shrewdness, generosity, courage.

* * *

The first issue of the *Revue Internationale du Chomage*, a periodical started by the International Association against Unemployment, with Max Lazard as editor-in-chief, is devoted to the subject of unemployment insurance. The opening editorial outlines the program of the magazine, which will cover the subjects of the organizations of industry and the special elements that affect the unemployment problem in each particular branch of industry; the statistics of unemployment; the relation of population to unemployment; the movement of industries, crises, slack seasons, and other factors that produce unemployment; legislation on the subject; and preventive and palliative institutions. On these subjects the magazine will aim to bring together in available form the facts and conclusions deduced from investigation and from practical experimentation. The review is to be published quarterly by the association (L'Association Internationale pour la Lutte contre le Clomage) at 34 Rue de Babylone, Paris.

* * *

The *Universalist Leader*, a weekly publication in the religious field, made of its issue of September 23 a social service number. There are articles by Mrs. Florence Kelley, Orrin C. Cocks, Prof. Walter Rauschenbusch, Rabbi Stephen S. Wise, Rev. John Haynes Holmes, and others.

* * *

That a city of 70,000 people should publish a Who's Who in its civic work is unusual enough, but that it should find 218

names properly belonging in such a list is even more striking. Yet that is what has just been done by Hoboken, N. J. This list is one feature in a charities directory of the city published by the Robert L. Stevens Fund for Municipal Research. The directory, which is the outgrowth of a civic renaissance that has been accomplishing things recently in Hoboken, was published to "make accessible for ready reference a minimum of facts about the various churches, charitable, civic, and educational organizations in Hoboken; to serve as a means of bringing more closely into efficient cooperation those persons who are working for the welfare of Hoboken; to increase the sympathetic support of uplift work; and to help workers and donors to discover needs not yet met and fields of effort not yet filled or entered. . . ."

In a booklet of sixty pages written in a picturesque and readable style by Mrs. Raymond Robins, the Women's Trade Union League of Chicago has issued the report of its Strike Committee on the garment workers' strike, which lasted from October, 1910, to February, 1911. The detail of the long weeks of suffering, of the many disinterested efforts at settlement, and of the well-organized relief work, are familiar to readers of *THE SURVEY*. The present report covers it all and forms an invaluable reference for all interested. (Price ten cents. Women's Trade Union League, 331 South LaSalle street, Chicago.)

* * *

A useful and comprehensive handbook of its activities has been issued by the Y. W. C. A. The work of the national board is divided into eight departments, method, foreign, conventions and conferences, secretarial, publication office, field work and finance. The department of method is further divided into three committees, on student associations, city associations and association extension.

"In the three years since the national organization was formed," says the Handbook, "the membership has increased from 146,259 to 216,360; thirty-nine city, three mill village and three county associations have been organized; fifty-two new buildings representing a cost of \$3,000,000 have been erected. Thirty-five thousand dollars has been contributed for a building in Calcutta, India, and two additional summer conferences have been opened, with capacity for entertaining four thousand women and girls. The National Board is experimenting in what have been hitherto untouched fields; for example, the department store, schools of art, music and drama, Indian schools, graduate nurses, rural committees and mining towns."

* * *

The Rhode Island Bureau of Industrial Statistics has recently published its second bulletin dealing with philanthropic agencies located in the cities of the state. This bulletin, which was prepared by Carol Aronovici, director of the Rhode Island Bureau of Social Research, describes the work of all important social agen-

cies in the state and is intended as a guide for those who are or might become contributors towards the work of the various welfare agencies.

In discussing the welfare work of the cities the writer emphasizes three important points, namely: the multiplicity of relief agencies and the duplication of effort in the same territory; the difficulty encountered in securing accurate data concerning efficiency of work, service rendered, and expenditures incurred, even in cases where the city or state contributes toward the support of such agencies; and the unwaranted increase in the number of day nurseries, which makes possible the employment of women to an extent that should make them subject to public supervision and control.

* * *

The report of the New York State Insurance Department on its investigation of the Metropolitan Life Insurance Company brings out the new social features of the company's work. Among these features, on the side of the policy-holders, is the distribution of literature in regard to the prevention of tuberculosis, which was begun after the study of the death claims of 1909 showed that 18 per cent of the deaths were due to this single cause. A recent development in tuberculosis work is the starting of building operations on a sanitarium at Mt. McGregor, New York, which is to be used ultimately not only for employes, but for policy-holders.

The system of visiting nurses started at the same time is now in practice throughout New York and Massachusetts, and in twenty-eight cities in other states. It is estimated that it can be extended to the whole field for not more than \$500,000.

For the company's office employes a welfare system is in existence covering cheap lunch room, library, gymnasium, savings bank, a sick fund, and a bonus system for long service.

* * *

Publication No. 13 of the American Association for Labor Legislation, which is Volume I, No. 2, of the *American Labor Legislation Review*, is a comparative analysis of laws in the various states for comfort, health, and safety in factories. This is the fourth of the series of such analyses of labor laws published by the association. The other three covered the Administration of Labor Laws (Publication No. 6), Woman's Work (No. 7), and Child Labor (No. 8).

* * *

The Vancouver special number of the *Single Tax Review* is a exposition of the workings of the experiment in land taxation, begun fifteen years ago in the Capital of British Columbia, which has now developed into a full-fledged single tax. Luther S. Dickey writes of the general development of Vancouver, and the mayor, the building inspector, and other citizens take up special aspects of the subject. The articles have copious illustrations showing the industrial development of the city.

* * *

Jacob A. Riis puts organized charity in the role of a modern St. George in the October *Scribner's*. Poverty is the dragon and in the spread of the charity organization movement throughout the country Mr. Riis finds his saint's growth to manhood. He takes New York city, however, as his theme and tells of the psychological change that has taken place since, in 1824, the secretary of state of the commonwealth recommended three methods of caring for the poor: "One to farm them out to contractors; another, to relieve them at their homes; and a third, to sell them at auction." Mr. Riis's treatment of the material is admirably calculated to rouse interest in those who hitherto have been indifferent.

COMMUNICATIONS

CONSERVATION OF YANKEES

TO THE EDITOR:

I cannot sympathize with the argument for the extermination of the Yankee put forward in *THE SURVEY*, October 7.

The writer has stated the correct principle, namely, that "One of the first problems of the conservation of the agricultural industry is the maintenance of a wholesome, happy rural population. Upon the character of the rural people—their intelligence, morality, ideals, and material well-being—more than on any other one factor depends the general welfare of the nation as a whole. A second but less important problem is the conservation and efficient utilization of natural resources."

He goes on to say that "the foreigner with his family is able to out-compete the industrious American, with a smaller family, a higher standard of living, and a stronger desire for the 'appurtenances of leisure.' The ultimate settlement of rural New England by foreign farmers—Italian, Slavic, Hebrew, perhaps Teuton—seems inevitable. Gradually they are dotting the rural districts with their farms, slipping quietly but surely into the homes vacated by native New England farmers." And he concludes that whereas the movement has up to the present time been sporadic, the time has now come when our federal and state institutions of agriculture should take the matter up and make this substitution of races go on in a more definite, systematic, and intelligent manner.

I cannot feel that the conclusion follows from the premises. The ousting of old New England stock from the land means its ousting from this planet, as city populations hardly reproduce themselves. Is that an end toward which we ought to strive? Has the old stock so proved its uselessness that we should bend our energies to hasten its extinction? Personally I cannot see anything in the history of Naples and the Sicilies, or in the long tragedy of the mixture of Jew and Slav tried out in Poland and Russia for now these two thousand years, which should lead us to feel that the substitution of these races will necessarily be an improvement.

The old stock was selected from the very best that England had to offer at that time. "God had sifted three kingdoms to find the wheat for this planting." Have the steamship companies sifted Austria, South Italy, and Russia with equal care and with as high a motive? Have those countries proved themselves better places to seek for the seed of successful democracy than Puritan England was?

For my part I cannot grow enthusiastic over proposals that we should spend money and energy for the sake of sterilizing the old Yankee stock and substituting therefor the proposed mixture of the hitherto unsuccessful members of the unsuccessful races or racial combinations of the Old World.

Boston.

JOSEPH LEE.

different from that of others, because the people who came here first came from the villages of Beirut and Mt. Lebanon. The people from Damascus, who have come more of late, are not inclined to ask aid, and seem to be of a higher type. I do not have many applications for charity for them now, because the experience has been such that the giving societies have been very slow to aid the Syrians, and the child helping societies almost invariably of late years refuse to take the children. It is quite true that the Syrians are generous to each other. I agree with Mrs. Houghton in that respect.

Boston.

JOTTINGS

SYRIANS IN BOSTON

TO THE EDITOR:

I relate my very different experience with the Syrians, in reply to the points in Mrs. Houghton's articles, especially in the one of September 2.

In her first article she characterized the prejudice against the Syrians in Boston as founded on small knowledge. The feeling against the Syrians in Boston comes entirely from experience. When we first dealt with them they were treated by every charitable society exactly as other people, but we found them extremely untrustworthy and unreliable. Few employers in Boston have found them satisfactory, and they have taken great pains to cheat the charitable societies, which accounts for the feeling existing here. She speaks of our knowing only the women of the family. I have had to deal with many men, but I have found their knowledge of English very small. Those who called here have generally had to bring interpreters. We have here many married women who peddle. Some of them have left their husbands in Syria, and some of them, in the testimony of their own educated countrymen, are of immoral character. None of the people in Boston consider them remarkable linguists. They are slow and take little pains in learning, although I believe they are beginning to improve. We have also found in them a great desire for dollars, which of course is natural. They always wanted an easy place with big pay, which no one wished to give them. Many Syrians have applied to me for charity, both directly and because they asked aid of other people to whom they went as peddlers, and to whom they said they were destitute.

Most of the Syrian people worked only as peddlers when they came to Boston. It is only now that they have started some factories in which women work. The streets where the Syrians live in Boston are the dirtiest that are in my district, instead of the cleanest, as Mrs. Houghton says, and those who have visited their homes do not consider that they live well, as compared with other nationalities. Possibly my experience may be

Business and Public Welfare.—The annual meeting of the New York Academy of Political Science which is to be held at Columbia University November 10 and 11 will be devoted to the discussion of Business and the Public Welfare. The topic of the first session, which will be held on the afternoon of November 10, in conjunction with the New York Association for Labor Legislation, will be the improvement of labor legislation, which will be treated in its various aspects by P. Tecumseh Sherman, Miles Menander Dawson, and Henry R. Seager, whose speeches will be followed by discussion by many who have made a special study of this subject.

At the anniversary dinner on the evening of the same day the subject will be the relation of government to business. Judge Elbert H. Gary, and Attorney-General George W. Wickersham will be guests of honor, and the speakers will be Hon. Albert B. Cummins, John Hays Hammond, George W. Perkins, and Robert Mather, chairman of the board of directors of the Westinghouse Electric and Manufacturing Company.

The discussion on the morning of November 11 will be on social efficiency in business. Professor Irving Lisher of Yale will speak on industrial hygiene and Raynal C. Bolling, assistant solicitor of the United States Steel Company, on Occupational Standards. In the discussion which will follow these addresses, many who are at present engaged in the work of raising occupational standards in special industries will take part.

Frank Tucker, vice-president of the Provident Loan Society, will preside at the final session, which is to be on financial facilities for wage-earners. William E. Harmon and Arthur H. Ham will read papers, the former on investments on the installment plan, the latter on remedial loans. Discussion on both papers and on other aspects of these questions will follow.

Tickets and programs for the first, third, and fourth sessions of the academy may be obtained by members and their friends by application to Emma S. Lake, assistant to the president, Columbia University.

Pennsylvania Conference.—In Pittsburgh, burgh, Nov. 14-16, will be held the third annual Pennsylvania Conference of Charities and Correction. The Rev. R. M. Little, president of the conference, will address the opening session Tuesday evening. Three vital subjects will be discussed on Wednesday: Courts and the Child, Wm. D. Crocker of Williamsport, chairman; Public Health, Dr. Samuel B. Dixon, of Harrisburg, chairman; Inebriety, Irvin F. Lehman, of Pittsburgh, chairman. Orlando F. Lewis, of New York city is also among the speakers.

Thursday the topics will be: State Supervision of Charities, Prof. Carl Kelsey of Philadelphia, chairman; Prevention of Blindness and the Employment of the Adult Blind, O. H. Burritt, of Philadelphia, chairman; The Church and Social Work, Bishop Rogers Israel of Erie, chairman. General discussions will follow the main papers.

The officers of the conference this year are: president, the Rev. R. M. Little, Pittsburgh; vice-presidents, Hon. Frank D. McClain, Lancaster, Hon. Vance C. McCormick, Harrisburg, James McB. Robb, Oakdale; secretary, Miss Agnes V. Knowlton, Pittsburgh; assistant secretaries, Allen T. Burns, Pittsburgh, Mrs. Emma Spear, Morganza, Mrs. Mary J. Van Hook, Harrisburg; social secretary, Miss May L. Allen, Pittsburgh; treasurer, E. D. Solenberger, Philadelphia. The officers of the conference have secured headquarters at 528 Fulton Building, Pittsburgh.

First Troubles of An Immigrant—Wladyslaw Perkowski came to the Pittsburgh Y. M. C. A. in a taxi-cab, with the following address:

Pittsburgh, Pa., Panewna
Stait 16 habereia. 47
Franciszek Pisczatowski

The immigration secretary, H. A. McConnaughey, took the Pole, with his wooden trunk and bundle, into the building and began to study the address. What followed is described in a leaflet got out by the Industrial Department of the International Committee.

"*Panewna* was Panama and so to Panama alley they went in the drizzling rain, but found no foreigners in the alley. They consulted a German store-keeper, who looked at the address and said, '*Panewna* may be *Penn. ave.* Sure, and its street 16; so away the secretary and his charge went in that direction.

"They found 16th Street but what of *habereia 47*? Mr. McConnaughey walked the street and studied the names of the alleys: that's it *Mulberry Alley*. The policeman was now interested, but assured the secretary, there's no 47 there; the numbers don't go that high. The secretary went from door to door and with the help of a store-keeper found 47—and also Franciszek Pisczatowski. The meeting of friends long separated was joyful. They kissed and embraced, and the crowd that gathered all smiled and felt happy. The secretary returned to the building and

looked as if he had been to a wedding, although he was drenched by the rain."

Annual Meeting of New York C. O. S.—The annual meeting of the Charity Organization Society of the city of New York will be held at 8:15 Monday evening, Nov. 13, in the assembly hall of the United Charities building. The principle speaker will be Judge Julian W. Mack of Washington, D. C., formerly of Chicago, and this year president of the National Conference of Charities and Correction.

The importance of local responsibility for social conditions in New York city will be the central topic of discussion. Among the speakers will be the Reverend William J. Kerby of Washington, who can speak out of his experience with the parish organization of the Roman Catholic Church; Mrs. John M. Glenn, chairman of the Committee on Co-operation and District Work of the New York society; and Miss Pauline Goldmark, of the Bureau of Social Research.

Admission to the annual meeting is by ticket, which can be procured by writing to the Charity Organization Society, 105 East 22nd street.

Economic Prizes—Prizes are again offered by Hart, Schaffner, and Marx for essays on economic subjects. Two prizes of \$1,000 and \$500 are offered to any American, and two prizes of \$300 and \$200 are offered to college undergraduates. The essays must be in by June 1, 1912. Prof. J. Laurence Laughlin, University of Chicago, is chairman of the committee of judges. Such topics as the following may be used: wage theories of American economists; agricultural education; the influences affecting the prices of agricultural products; a lumber policy for the United States; would public interests be subserved by the amendment or repeal of the so-called Sherman anti-trust law?; capital building through corporation savings; control of securities of public service corporations; a scientific basis for tariff revision.

History of Hartford Streets—A recent pamphlet published by the Municipal Art Society of Hartford, which must represent much work, suggests something which it would be well to have done in every city, though the work would seem to belong more properly to the local historical societies. This is a history of the city streets, giving the origin of their names and the dates when they were accepted. The pamphlet makes a book of nearly one hundred pages, and represents four years of work by Albert L. Washburn and Henry R. Buck, for the committee on parks and thoroughfares and playgrounds. The bulletin is designed "to give in alphabetical order the name of every street, avenue, alley, or place which is likely to be referred to in the land records of the Town of Hartford, as the front boundary of any piece of property. The origin and meaning of the name is also given, in so far as it has been possible to obtain it."

CALENDAR OF CONFERENCES

NOVEMBER CONFERENCES.

- 1-3 *Maine State Conference of Charities and Correction*—Augusta, Me. Secretary, Francis H. Miller, 85 Market Street, Portland, Me.
- 2-4 *Industrial Education*—National Society for Promotion of. Cincinnati, O. Secretary, J. Henry Cone, 20 W. 44th St.
- 3-12 *American Land and Irrigation Exposition*.—New York city. Corresponding officer, Gilbert McClurg, Singer Bldg., New York city.
- 9-11 *Missouri State Conference of Charities and Correction*—Kansas City, Mo. Secretary, W. T. Cross, Columbia, Mo.
- 9-12 *Minnesota State Conference of Charities and Correction*—Duluth, Minn. Secretary, Eugene T. Lies, City and County Bldg., Minneapolis, Minn.
- 10 *Legal Aid Societies*—National Convention of. Pittsburgh, Pa. Corresponding officer, W. B. Blaxter, St. Nicholas Bldg., Pittsburgh, Pa.
- 13-16 *Municipal League*—National annual meeting. Richmond, Va. Secretary, L. McK. Judkins, 12 So. 14th St., Richmond, Va.
- 14-16 *Juvenile Court Conference of Middlewestern States*—Louisville, Ky. Secretary, Bernard Flexner, Louisville, Ky.
- 15 *Conference of Denominational Committees on Social Service*—Worcester, Mass. Secretary, Rev. Margaret Barnard, Rowe, Mass.
- 16-18 *Florida State Conference of Charities and Correction*—Jacksonville, Fla. Secretary, V. R. Manning, 28 E. Bay street, Jacksonville, Fla.
- 16-18 *Infant Mortality*—Association for Study and Prevention of. Chicago, Ill. Secretary, Gertrude B. Knipp, Medical and Surgical Faculty Bldg., Baltimore, Md.
- 23-24 *South Carolina State Conference of Charities and Correction*. Columbia, S. C. President, A. T. Jamison, Colonia Hotel, Columbia, S. C.
- 27-29 *Maryland State Conference of Charities and Correction*—Baltimore, Md. General Secretary, H. Wirt Steele, 15 E. Pleasant Place, Baltimore, Md.
- LATER MEETINGS.
- International.*
- Sept. 4-13, 1912 *Chemistry, Applied*—Congress on. Washington, September 4. and New York, September 6-13. Secretary, Bernard C. Hesse, M. D., 25 Broad street, New York city.
- Sept. 23-28, 1912 *Hygiene and Demography*—Fifteenth Congress on. Washington, D. C. Secretary, Dr. John S. Sutton, Army Medical Museum, Washington, D. C.
- Sept. 1912 *Labor Legislation*—Association for. Zurich, Switzerland. Secretary, Stephen Bauer, Basel, Switzerland.
- 1915 *Prison*—Quinquennial Congress. London, England. Secretary, F. Simon Van der Aa, Groningen, Holland.
- 1915 *Relief*—Committee on Public and Private. London, England. Secretary, Charles S. Loch, Charity Organization Society, London.
- 1913 *Fight Against Unemployment*—The International Association for. Ghent, Belgium. American corresponding officer, J. B. Andrews, 1 Madison Ave., New York city.
- National.*
- Dec. 5-9 *Public Health*—American Association. Havana, Cuba. Secretary, William C. Woodward, M. D., District Bldg., Washington, D. C.

- Dec. 13-15 *American Civic Association*. Washington, D. C. Secretary, Richard B. Watrous, 914 Union Trust Bldg., Washington, D. C.
- Dec. 27-30 *American Economic Association*—Washington, D. C. Secretary, Prof. T. N. Carver, Harvard University, Cambridge, Mass.
- Dec. 27-30 *American Sociological Society*—Washington, D. C. Secretary, Alvan A. Tenney, Columbia University, New York city.
- Dec. 27-30 *American Political Science Association*—Buffalo and Toronto (Dec. 30). Secretary, W. W. Willoughby, Johns Hopkins University, Baltimore, Md.
- Dec. 27-30 *American Historical Association*—Buffalo, N. Y. Secretary, W. G. Leland, 500 Bond Bldg., Washington, D. C.
- June, 1912 *Women's Clubs*—General Federation of. San Francisco, Cal. Corresponding Secretary, Mrs. Frank Shiek, Wheatland, Wyo.
- Sept. 1912 *Catholic Charities*—National Conference of. Washington, D. C. Secretary Rev. Dr. William J. Kerby, Catholic University, Washington, D. C.
- State and Local.*
- Jan. 25, 1912 *New York Peace Society*. Hotel Astor, New York city. Corresponding officer, William H. Short, 507 Fifth Ave., New York city.
- Jan. 1912 *Nebraska Conference of Charities and Correction*—Omaha, Neb. Secretary, Ida V. Jontz, City Hall, Omaha, Neb.
- Autumn, 1912 *Massachusetts State Conference of Charities and Correction*—Secretary, Parker B. Field, 229 Tremont street, Boston, Mass.

SOCIAL FORCES

BY THE EDITOR

OLYMPIA LAW VS ALBANY LAW

When the Supreme Court of the State of Washington addressed itself, late in September, to the very live question of the constitutionality of a workingmen's compensation act, the particular measure before the court differed considerably from the one which had been previously passed upon by the New York Court of Appeals.

The differences, however, did not substantially affect the question of constitutionality. If the one is obnoxious to state and federal constitutions, the other is also. No attempt is made by the Washington court to reconcile its views with those of the New York court. Scant courtesy, indeed, is paid by Olympia to Albany. Chief Justice Dunbar remarks:

In the foregoing discussion we have not referred to the decision of the Court of Appeals of the state of New York . . . which holds the workingmen's compensation act of that state to be in conflict with the due process of law clause of the state constitution, and the fourteenth amendment to the constitution of the United States. The case has, however, been the subject of extended consideration in the briefs of counsel, and it is urged upon us by counsel for the auditor as conclusive of the question at bar. The act the court there had in review is dissimilar in many respects to the act before us, and is perhaps less easily defended on economic grounds. The principle embodied in the statutes is, however, the same; and it must be conceded that the case is direct authority against the position we have here taken. We shall offer no criticism of the opinion. We will only say that, notwithstanding the decision comes from the highest court of the first state of the Union, and is supported by a most persuasive argument, we have not been able to yield our consent to the views therein taken.

No criticism! Some of our correspondents unjustly accused THE SURVEY of sarcasm in its attempt to explain the disastrous character of the New York decision. And now the first state supreme court which has an opportunity to follow or to reject the Albany decision, after calmly refusing to devote so much as a single line to replying to its arguments, takes the trouble to explain that this is not because the court was unaware that such a decision has been made, but merely because they "have not been able to yield their consent to the views therein taken." If, in law, this is not criticism, we venture to suggest, not in sarcasm but in all seriousness, that judges might well prefer to be criticized. Has the full effect on the prestige of this "highest court of the first state of the Union" of such decisions as the one which the state of Washington has thus refused not only to follow but even to take seriously into account yet been realized by the bench and bar of this state? We are not generalizing from a single instance. It is scarcely a year since the Supreme Court of Kansas had occasion to analyze the relations between the factory law and the common law in regard to industrial accidents. At that time New York decisions were cited, to the effect that "human foresight is limited and masters are not called upon to guard against every possible danger . . . but only such as would occur to a reasonably prudent man as liable to happen." This opinion, says the Kansas court, "proceeds upon the same lines as if the statute did not exist." Kansas justice, speak-

ing by the mouth of Judge Burch, assumes that the purpose of the factory act is "to preclude a roving quest for the meaning of words," and to give them such an interpretation as will "protect working people from mutilation, physical deformity, pain, mental anguish, and death occasioned by the absence of practicable safeguards from the environment of their toil."

We make no sweeping charges against New York courts and do not wish to be understood as holding up those of Kansas and Washington as more learned, more humane, or more entitled to respect. We are merely contrasting two types of judicial reasoning, both of which might readily be represented in any section of the country; and no more illuminating specimens occur to us of each type than that followed respectively in New York and Washington in deciding whether workingmen's compensation acts are constitutional. We need scarcely recall the reasoning by which at Albany it was discovered that to enact a compensation law is to "subvert the fundamental idea of property," is "legislative assumption of the right to direct the channel into which the private energies of the citizen may flow," and a "legislative attempt to abridge or hamper the right of the citizen to pursue, unmolested and without unreasonable regulation, any lawful calling or avocation which he may choose."

In contrast with this "roving quest for the meaning of words," we reproduce two paragraphs from the law as it is interpreted in Olympia:

If the act in controversy has a reasonable relation to the protection of the public health, morals, safety, or welfare, it is not to be set aside because it may incidentally deprive some person of his property without fault or take the property of one person to pay the obligations of another. To be fatally defective in these respects, the regulation must be so utterly unreasonable and so extravagant in nature and purpose as capriciously to interfere with and destroy private rights.

That the statute here in question has the attribute of reasonableness, rather than that of capriciousness, seems incontrovertible. The evil it seeks to remedy is one that calls loudly for action. Accidents to workmen engaged in the industries enumerated in it are all but inevitable. It seems that no matter how carefully laws for the prevention of accident in such industries may be framed, or how rigidly they may be enforced, there is an element of human equation that enters into the problem which cannot be eliminated and which invariably causes personal injuries and consequent financial losses to workmen engaged therein. Heretofore these losses have been borne by the injured workmen themselves, by their dependents, or by the state at large. It was the belief of the Legislature that they should be borne by the industries causing them, or, perhaps more accurately, by the consumers of the products of such industries. That the principle thus sought to be put into effect is economically, sociologically, and morally sound, we think must be conceded. It is so treated by the learned counsel who have filed briefs [against the constitutionality of the law]; it is so conceded by all modern statesmen, jurists, and economic writers who have voiced their opinion on the subject; . . . Indeed, so universal is the sentiment that to assert the contrary is to turn the face against the enlightened opinion of mankind. . . . The act, therefore, having in its support these economic and moral considerations, is not unconstitutional for the reasons suggested upon this branch of the argument [i. e. the due process of law clauses].

Our prediction of last April that judges who wished to do so could reconcile a compensation act with the constitution is thus literally and with gratifying celerity fulfilled. In Olympia the fact that a proposition is sound in economics, sociology, and morals appears to create a presumption that it is sound also in law.

THE COMMON WELFARE

FROM SAFETY ON TO SANITATION

Striking in their contrast, two articles in this issue deal with safety. The community, the responsible corporation, the engineering profession, and the state—all, as Mr. Taylor brings out in his report, bore responsible relationship to the concrete dam at Austin which cracked and caved down before the rush of waters and death which swept that Pennsylvania valley. In the hey-day of neglect of the human element in steel making, those seventy-six Austin fatalities would have been but a fraction of a year's toll of sudden death in spectacular blast furnace explosions, and in the splash of hot metal, and more especially in the snuffing out of life by unsheathed gears, unrailed platforms, breaking chains—the

undramatic causes of uncounted injuries of a sort only to be guarded against by infinite pains. In Mr. Fitch's article is described the development in the past three years, on the part of the largest employing corporation in the country, of the most remarkable safety organization in the New World. He describes its concern over details, its promotion of invention to protect life and limb, its investment of large sums in me-

chanical safeguards, its enlistment of co-operative committees of foremen and workmen, its thoroughness and reach, and above all the spirit of team play best exemplified by the slogan of one of the great constituent companies, "boosting for safety."

Whoever reads Mr. Fitch's article will better be able to gauge the importance of an announcement here first given publicity. The past month the United States Steel Corporation has appointed a committee on sanitation, which will concern itself with the conservation of health in plant management and mill towns, which is made up of some of the strongest and most constructive operating men in the industry and which, it is announced, is to go at its work with the same breadth and

thoroughness of detail which have marked the safety campaign.

The appointment was made at a meeting of the presidents of the subsidiary companies of the United States Steel Corporation held on October 19. The Committee consists of

George G. Crawford, president of the Tennessee Coal, Iron, and Railroad Company, chairman;

William B. Schiller, president of the National Tube Company;

W. J. Olcott, president of the Oliver Iron Mining Company;

SAFETY.

Sign printed in a universal tongue on dangerous electrical apparatus, for men who cannot read; as used in the plants of the Illinois Steel Company.

Thomas Lynch, president of the H. C. Frick Coke Company;

R. C. Bolling, assistant general solicitor of the United Steel Corporation.

The committee will have the services of C. L. Close, who is secretary of the Committee of Safety of the Steel Corporation. The scope of the work is described as follows:

The committee will act as a clearing house for information of all kinds upon subjects relating to sanitation and will give all of the subsidiary companies advices as to what is being done by each in matters of this kind, to the end that all may have the benefits of the study and experience of each of the companies toward the solution of many problems of sanitation which are common to most of the companies.

PRISON LABOR WILL NOT DOWN

With the subject of prison labor nowhere on the program of the American Prison Association, in session last month at Omaha, Neb., a strong undercurrent of feeling asserted itself and resulted in the appointment of a committee to study the problem and report to the Baltimore meeting in 1912. The scope of the committee's investigations, and the range of its methods, were not delimited. Appointed by T. B. Patton, president of the association and general superintendent of the Pennsylvania State Reformatory at Huntingdon, Pa., the committee consists of six members:

F. H. Mills, sales agent of State Prisons of New York, chairman;

Joseph P. Byers, secretary of New Jersey State Charities Aid and Prison Reform Association, secretary;

Kate Barnard, state commissioner of Charities for Oklahoma;

Samuel Gompers, president of the American Federation of Labor, Washington, D. C.;

Dr. J. T. Gilmour, warden of Central Prison, Toronto, Canada;

Albert Garvin, warden of state prison, Wethersfield, Conn.

How far the insurgent members on the committee will be able to bring forward radical and constructive recommendations remains to be seen.

This action of the association was precipitated by Miss Barnard, who broke through the traces that have kept contract labor out of active discussion in the American Prison Association, and in a

strong address, filled with an insistent appeal to religion and humanity, carried the audience with her. To come to Omaha for this purpose, Miss Barnard left a sanatorium where she has been since the National Conference of Charities and Correction in Boston last June, which she had attended following a long and exhausting winter's work. Her mission grew out of her experience two years ago in unearthing the abuses to which the Kansas prison authorities were putting Oklahoma convicts in the Kansas mines—conditions which led Oklahoma to withdraw its prisoners and Kansas to effect belated reforms. It was not till the next to the last day of the Omaha convention that Miss Barnard got the floor for this purpose; and she carried it by storm.

NATIONAL ORGANIZATION TO PROMOTE EFFICIENCY

A National Society for Promoting Efficiency is in process of promotion: made up of efficiency engineers who seek an audience beyond the bounds of the professional associations already in touch with their work, of economists who want to thresh over dynamic problems with practical men, and of manufacturers and business men who want a medium for discussing the scientific phases of management with the specialists in the different fields of engineering, accounting, and economics.

Following are the members of the organizing committee: H. F. J. Porter, industrial engineer, New York, chairman; Harrington Emerson, president Emerson Company, Efficiency Engineers; W. M. Williams, manager Universal Audit Company; Joseph French Johnson, dean New York University School of Commerce, Accounts, and Finance; W. H. Lough, secretary Alexander Hamilton Institute; John Dunlap, proprietor *Engineering Magazine*; Henry R. Towne, president Yale and Towne Manufacturing Company.

The promoters feel that the society should become "the most influential body in America working toward increased national efficiency"; and they include a very considerate practical social content in the scope of the work

planned. Their definition of purposes follows:

Modern industrial and transportation organization is largely an outgrowth of the past fifty years; the modern commercial and financial organization of business has been developed chiefly in the last twenty-five years. So rapid has been this development that it has been impossible to standardize business operations and put them on a really efficient basis. The whole movement has taken place within the life-time of those who started it, and there has been no adequate opportunity for study and control.

While it is true that these conditions have brought to the front many able executives, it is also true that, owing to the great number required, many untrained men have been thrust into positions of great responsibility. It is not surprising that this haphazard leadership has given rise to great inefficiency, to ruinous competition, to unnecessary waste, to useless and expensive conflicts between workmen and employers.

We are now beginning to realize the necessity for formulating and standardizing systems of organization and methods and principles of management. Through the activities of private firms, of universities, of publications, and of various local associations, much has been accomplished. Vastly more could be done, however, if these efforts were correlated and to some extent guided by a national society. . . . It should include executives from all lines of business, public accountants, industrial engineers, recognized experts in such fields as advertising, systematizing, selling, purchasing, sanitation, hygiene, and social service, as well as lawyers, economists, educators, legislators, and government officials. It would thus provide a common meeting ground where men interested in business efficiency, using the word business in its broadest sense, could become acquainted and exchange ideas.

LATEST WAY MARK IN CHURCH ADVANCE

The programs of the great denominational gatherings show the awakening social consciousness within the churches. On three national occasions, held in close succession, the Congregationalists have afforded the latest evidence of this advance. Their newest national organization, the Congregational Brotherhood, signalized its fourth convention at Chicago with a social emphasis the more noteworthy for being laid not only in papers especially devoted to philanthropic effort but all along the line of discussion.

It was as strong in the presentation of such subjects as the Meaning of

Membership in the Church, which was said to be "to make the teachings of Christ the practice of the world," as it was in handling the relation of the church to the problems of relief, industry, child labor, and vice. It was as marked in the appeal of Dr. Gunsaulus's sermon "for freedom, unity, and brotherhood" as in Owen R. Lovejoy's more concrete plea against child labor, strongly reinforced as the latter was by an effective child labor exhibit.

Departmental conferences vigorously threshed out such issues as Ideals of Labor, Conciliation in Labor Disputes, Community Interests, Constructive Philanthropy, and Political Responsibility. At a Sunday labor mass meeting the social interests of the convention culminated in two addresses, the first being John Mitchell's interpretation of Labor's Program for Industrial Justice. A listener writes of it:

Sane and safe, in dead earnest and yet in complete self-command, giving evidence of his great progress in self-expression and public speech, he carried his audience with him throughout his effective plea.

The second was the incisive charge of Dean Charles R. Brown of Yale Divinity School to do the will of God in the use of land and of natural resources, in the organization of industry, and in the wages and conditions of employment, in provision for home life. Taking laymen at their word to the effect that economics and politics are "their affairs and not the parson's," he said:

It is their affair, and if they will go down to their stores and their shops every day saying, "The will of God must be done here," every minister on God's green earth will gladly take his texts for the next ten years from the seventeenth chapter of John.

The Rev. Henry D. Atkinson, who a year ago was elected secretary for Labor and Social Service, was chosen secretary of the National Brotherhood and will continue also to maintain its social propaganda.

Sixty-five years ago, long before the other denominational agencies assumed a more social attitude, the American Missionary Association began its specialized work. From the beginning it devoted its work to the educa-

tional, industrial, and social uplift of the Negroes, Eskimos, mountain whites, American Indians, and lately even of the Porto Ricans and Hawaiians, in cooperation with the churches it has planted among these peoples. In its farm schools it has taught agriculture and shop work. In connection with its city schools it has established playgrounds, branches of the public library, and school lunches. In its colleges and universities it has raised up such institutions as Hampton, Tougaloo, Fiske University among the Negroes, and the Santee Normal Training School among the Indians.

The event of these Chicago meetings of the most dramatic significance was the appearance of Julius Rosenwald, the most prominent Jewish merchant of Chicago and the city's most generous giver, upon the platform of this Christian missionary association. The subject which he discussed was Race Prejudice. After declaring his belief that "nothing is being done which tends more to break down the barriers of race prejudice than the work for the Negro by this association," he uttered a ringing protest against race prejudice toward the Jew and the Negro.

SOCIAL STATESMANSHIP OF THE MISSIONARY MOVEMENT

That the broadening social vision of the churches at home has long been anticipated by their foreign missionaries abroad was again apparent in the way in which the men and the women from the foreign field presented their work to the American Board of Commissioners for Foreign Missions. Their utterances were significant as much for the omission of epithets, as for the direct references to the economic, hygienic, industrial, and political aspects of their work. "Heathen" and "pagans" seldom, if ever, were referred to. While the supremacy of the ideals and teachings of Christianity was as positively maintained as ever, the great ethnic faiths were always spoken of with respect for the truth admitted to be in them. The revolution of the Young Turks and of the Chinese patriots, with all the international complications and diplomacy

involved, were discussed as a part of the missionary propaganda. The bearings of the division of the African continent upon its people and upon the progress of the world was treated from the point of view of missionary statesmanship. Material interests, such as the building of roads and railways, the water and light supply, housing and health, food and waste, child labor and the slavery of women, the care of the insane and the sick, the enactment of law and the administration of the police, together with many specific social agencies, were regarded as factors and solutions in the problems of missions.

COORDINATING CHURCH AND SOCIAL SERVICE

Last June, at a preliminary conference held in Boston, consisting of representatives of the various denominations which are definitely organized in the interest of social service, a committee consisting of Rev. Charles S. Macfarland, Secretary of the Social Service Commission of the Federal Council of Churches of Christ in America, the Rev. Charles Stelzle, of the Presbyterian Department of Church and Labor, the Rev. Henry A. Atkinson, secretary of the Congregational Brotherhood, the Rev. Harry F. Ward, secretary of the Methodist Federation for Social Service, and the Rev. J. Howard Melish, secretary of the Episcopal Commission, was appointed to arrange a larger conference for the purpose of coordinating and bringing into cooperation the developing work of the various denominations for social betterment. This conference will be held at the Hotel Sherman in Chicago, November 8 and 9, to be attended by two representatives from each denomination of the federal council. The program will include general reports and survey as to the state of present organization and the plans underway by each denomination, preparatory to considering the work of interdenominational cooperation. The wide program recently adopted for the activities of the Federal Council Commission will be taken up in detail. About twenty denominations will be represented, the delegates coming from all sections of the country.

EDITORIAL GRIST

JUVENILE DELINQUENCY AND EMPLOYMENT

BEN B. LINDSEY

Judge of the Juvenile Court, Denver

While it is frankly stated by the compilers of volume VIII¹ of the federal investigation findings on the condition of women and child wage-earners that, because of the difficulties encountered, this report is not all that was hoped for, or all that can be desired, they are nevertheless to be congratulated upon a production of real merit and value. The report demonstrates anew the necessity for a federal children's bureau such as THE SURVEY and workers for children generally have advocated.

I am not surprised at the difficulties encountered. In the present development of the juvenile court and probation system they were to be expected. Notwithstanding the good that has been accomplished, no one knows better than those who have been long identified with this work how far it still is from the satisfactory stage to which it should be possible in time to bring it.

Keen appreciation and intelligent comprehension of the work undertaken is shown in the introductory chapter; and those that follow fully justify our expectations. The individual cases of 4,839 delinquents (561 female, 4,278 male) studied by the investigators form the basis of the report. These delinquents were concerned in 8,797 offences. Of the total number, 2,767 having been at some time employed are referred to as "working" and 2,772 who were never employed are

termed "non-working" delinquents. Working children were responsible for 5,471 and non-working for 3,326 offences. The ages of the delinquents range from nine to sixteen years.

In view of the different methods of keeping records and the difficulty of gathering accurate records, the method pursued is about the only one that can be followed in any thorough investigation of this character. And even then it is impossible to be sure of some of the conclusions that such an investigation might seem to warrant.

The committee wisely selected for study a limited number of cities, presenting typical conditions, keeping in mind that such cities should be situated preferably in industrial and commercial centers, where opportunities for child labor would naturally be abundant and where education and child labor laws would be found. It is to be regretted that so excellent a corps of workers did not have opportunity to add to the list of cities selected at least one rural city—such, for example, as Lincoln, Neb. The additional interesting comparisons with industrial cities this would have made possible would have heightened the value of the report as a whole.

The cities chosen were Baltimore, Boston, Indianapolis, New York, Newark, Philadelphia, and Pittsburgh. For the study of working and non-working children no better selection could have been made. It includes practically all varieties of juvenile courts. Three cities, Baltimore, Boston, and Indianapolis, have special or separate children's courts—Baltimore and Indianapolis being the first cities to have such separate courts. Pittsburgh, Philadelphia, New York, and Newark cover about all the other kinds of children's courts, which are usually a special division of a general court of record. It does not include that sort of special court whose jurisdiction is somewhat broader, and covers every case that concerns not only the correction of children, but all adults whose offences concern the morality or person of a child. But this was immaterial to such an investigation.

The investigators at once recognized the differences in the form and methods

¹REPORT ON THE CONDITION OF WOMAN AND CHILD WAGE-EARNERS IN THE UNITED STATES. In 19 volumes. Volume VIII: JUVENILE DELINQUENCY IN ITS RELATION TO EMPLOYMENT. Prepared under the direction of the Commissioner of Labor, Washington, 1911. "The general conduct of the field work has been under the direction of Special Agent Annie E. McCord. In the preparation of her report important assistance has been given by Mary Conyngton. In the drafting of the schedule of inquiries for the investigation Dr. Henry J. Harris rendered valuable aid, while the tabular work has been carried on under the direction of Chas. E. Baldwin. The general preparation of the report, has, however, been carried on under the direction and immediate supervision of Charles H. Verrill."

of these juvenile court organizations, and the difficulty of getting even from the best-kept records the necessary facts and information for tables and conclusions. But those not actually engaged in such work seldom appreciate the difficulties involved. Much of the information called for is of questionable value and involves time and expense that the equipment of many courts makes almost impossible, unless at the sacrifice of work for the children. Again, some probation officers, who are competent and effective in getting good results with and for children, seem perfectly hopeless when it comes to getting all the data and information called for by juvenile court blanks that seem interminable in their demands for information. On the other hand, an officer good at the clerical and inquisitive work necessary for such complete "records" often proves correspondingly inefficient in really accomplishing anything for the child. The necessity for such information in some cases and the seeming absurdity of it in others makes it hard to get the average probation officer fully to appreciate its importance.

The report does clearly indicate the necessity for a more uniform system of organization, work, and method. While of course the personal work that concerns the relation of a particular probation officer to a particular delinquent must necessarily be left largely to the individual, it is true that a great improvement in the value of the facts, as well as in the general results, will be attained by more uniformity. It was never expected that this would come all at once. The marvelous thing about the juvenile court system is the rapid growth that has marked its ten years of existence. Many of the laws and practically all of the principles that have been embodied in the juvenile court system existed long before the date generally fixed as its beginning. But since it was nearly a hundred years before this nebula of idea, law, and principle, through decades of discussion and investigation, began to form into some definite system, it is asking too much to expect that, in a space of a little more than ten years, we should achieve anything like the perfection necessary for

those ultimate results and that satisfaction that is bound to come in time. It is pleasing to note that the investigators themselves—while acknowledging their own difficulties—are quite charitable with those of the courts. Indeed, the report is bound to add to rather than detract from the general appreciation and popular regard for the juvenile court system of America.

The report is pretty well confined to its main subject, Juvenile Delinquency in its Relation to Employment; and while the almost necessary side-lights, discussions, and references in other directions are as limited as possible, they are also of much interest and value. While the report frankly admits the many recognized causes of delinquency, its chief merit consists in clearly demonstrating that child labor is one of the chief causes of delinquency. It is one of the most convincing cases ever made against the child labor iniquities of this country. It conclusively demonstrates the necessity not only for more stringent child labor laws but for their better enforcement, and is itself the justification for the work done by the National Child Labor Committee. The report completely explodes the idea that the working boy and girl under sixteen years of age is freer from the dangers of delinquency than the non-working child. From this undoubtedly thorough investigation and study of 4,839 cases of delinquents (of whom 561 were girls and 4,278 were boys), we have carefully worked out for us interesting sets of tables, almost bewildering in their detail, showing 2,416 working as against 1,862 non-working delinquent boys, and 351 working as against 210 non-working delinquent girls, or a total number of 2,767 working delinquent children as against 2,072 non-working delinquent children. The ratio of working delinquents is very much larger than that of the non-working in the seven cities, varying from three to ten times that of the non-working, with the disproportion even more striking among the girls, making it perfectly clear, as one chapter concludes, "that putting children to work prematurely is not an effective method of

training them for good citizenship." Another interesting fact is that the repeaters or recidivists (those apprehended for from the second to the tenth offence) are found mostly among working children, with the proportions much larger among the younger working children between nine and fourteen years of age.

The report is unusually fair in conceding a variety of details and difficulties that might discredit its conclusions; but there is no disputing its final demonstration that working children not only contribute more in actual numbers but in an alarmingly larger proportion than do non-workers to the criminal classes. It forces upon us the idea that the virtues necessary to good citizenship are not so much inherited as acquired. It follows that we are doing hideous injustice to our children by unnecessarily subjecting them to temptations which their untrained, immature souls are not yet able to withstand.

These temptations naturally enough are greatest among the six groups of working boys who furnish the most delinquents. They are well known to juvenile court officers. These six groups are: delivery and errand boys, who furnished 491 delinquents, or 20.3 per cent; newsboys and bootblacks, 449, or 18.6 per cent; office boys, 46, or 1.9 per cent; street vendors, 66, or 2.7 per cent; telegraph messengers, 73, or 3 per cent; employes in amusement resorts, 51, or 2.1 per cent. The total of these six classes, 2,416, is more than one-half of the total number of 4,278 cases of delinquent boys investigated.

The offence most frequently occurring among the boys is of course larceny, which constitutes more than half of all the delinquency reported. Putting these immature children to work simply contradicts the supplication of the Christian's prayer, "Lead us not into temptation, but deliver us from evil." The temptation of dishonesty constantly besets the working child, much more than the non-working. The results shown are natural and to be expected. The next in order of frequency are incorrigibility and disorderly conduct, terms so indefinite as often to include larceny. Truancy appears only in 185 cases, and begging in only

seven. Every juvenile officer will appreciate the more than probable accuracy of these tables; for, with one or two exceptions of minor importance, they are confirmed by their common experiences, for which heretofore reliable tables have been rather scarce.

The tabulations concerning the parental condition of the delinquents confute another popular fallacy (which indeed was long since exploded by Jane Addams and other champions of child labor laws), that most working children are sons and daughters of widows. Only 419 boys, or 17.3 per cent of the entire number investigated, were sons of widows, and but 185, or 8.7 per cent, were orphans; while 1,318, or more than half of the entire number had both parents living.

Curiously enough, too, the tables show that proportionately the great majority of these delinquent boys, employed or unemployed, came from average good homes. Indeed, 76.2 per cent of the delinquent working boys are listed as from "fair or good homes." The results seem to prove what has often been emphasized by juvenile officers: that a good home is not as complete a guarantee of a good boy or girl as it would seem reasonable to expect. The influence of the home—while the most important and the one that counts most—is by no means the only one under which a child is placed, especially in that kind of city life which has come to this country in the past fifty years and which is to become in every particular more terrific in the next fifty years, unless there are some unexpected changes. It is furnishing in many respects a new environment, under which most of our children are to be reared. It means that we have got to make war against the street, the conditions, the environment, the causes, if we are to perform our full measure of duty to our children.

Children of native-born parents furnished 44.7 per cent of the delinquent boys as against 55.3 per cent who were the children of foreign-born parents. Considering the far greater ratio of native-born parents, this clearly indicates that there is less control over their children by foreign than by native parents.

The number of girl delinquents investigated is rather small. But even with so small a number (561) the tables offer many points of interest and value. Details as to parentage, the various kinds and character of employments, and the different degrees of danger attached to each employment in the case of girls, as in that of the boys, have been carefully and cleverly worked out. Domestic workers seem the most unfortunate when it comes to the troubles of girls. These tables seem to show that girl offenders come principally from among those of native-born parents—a tendency, curiously enough, especially marked among delinquent domestics. I doubt if this would be the result if a larger number were subjected to the same investigation. The investigators themselves were puzzled at a result so unexpected. But they point out that the number of colored girls among those investigated has much to do with the result. Colored girls are nearly all credited to native parents.

In 1905 at Hull House an International Juvenile Court Society was formed. Its

purpose would have embraced among other things just such work as this report, the necessity for it being more than apparent. But the expense was prohibitive and the organizers decided to turn to the Sage Foundation and the national government to carry out its purposes. The Sage Foundation responded generously and has issued, or is about to issue, some volumes and reports of exceptional value.¹ While the Federal Children's Bureau has not yet come to do similar and other even more important work, the aid given by the government in this report, which sheds so much light on juvenile delinquency in its relation to employment, will hasten the day when the government will enable us to know as much about the causes of the troubles and misfortunes of our children as it has done in the case of our hogs and cattle. Great credit is due the authors of this report.

¹The Russell Sage Foundation has in preparation:

THE DELINQUENT CHILD AND THE HOME. By Sophonisba P. Breckinridge and Edith Abbott.
THE DELINQUENT CHILD AND THE COURT. By Henry W. Thurston.

THE HOTEL MESSENGER

[See Cover Photograph.]

HORTENSE FLEXNER

His buttons shone, his eyes were glad;

His body, quick and over-thin,
Was tingling to an hundred calls
Of beauty, color, reckless sin.

The tireless little immigrant!

How eager up and down he ran
The great hotel's long corridors;
Too soon a young American!

Too proud of the quick slang that flew

From his gay lips in silver tone,
Of cap and buttons; all that marked
His newer country as his own.

Too joyous in the "job" he held,

And in the splendor of the scene;
Each door that opened to his tap
Was wonderland in lace and green.

And sometimes he was of the jest,

For that too knowing glance and smile
He wore like some forced flower of spring,
His sun of summer to beguile.

But once as down the hall he raced,

Past music-room and salon-row,
A melody grew on the air
And filled it like a purple glow.

It was a song of night and star,

Of shadows and the sleeping sea.
Of voyagers in countries far,
A yearning song of Italy.

And listening breathless, he forgot,

His messages, his note of joy,
Forgot all—saying that he was
A tired, sleepy little boy;

Who saw beyond the gilded lamps

A great ship's gang plank swing away—
Crowd, shore, and far Italian hills
Die with the blue of Naples' Bay.

MEMORIES

MARY BOYLE O'REILLY

The waiting commissioner,¹ attempting to look official, tried to suppress a smile. About her, somber and suggestive, lay the great silent prison, last haven of human derelicts, a huge moral hospital filled with sin and suffering. But these accustomed facts failed of their force to depress, for Delia was coming—Delia, with her brave heart and her unconquerable spirit, Delia, with the laughter and the tears of her motherland etched in wrinkles on her finely featured face. She tripped into the office blithe and appealing, with the courage of her sixty and odd years, spread a scant skirt deftly as she sat on the prisoner's stool, folded her work-worn hands politely, and flashed an indomitable smile at the younger woman. Then the soft old lips murmured the familiar phrase:

"To go out again on probation, Commissioner, if you will be so kind."

"Again, Delia! How many times does this make?"

"For fear to tell a lie, I don't know; mebbe fifteen; mebbe twenty. The first time was when I was getting old and they put the new looms in the mill."

"But Delia, *Delia!* An honest, industrious woman like you! Not a mark on your conduct card, a model of neatness, good-natured! Fifteen or twenty sentences for assault!"

"And battery," added Delia calmly, as one who desires to perfect a record.

"But why?"

The prisoner's withered hands grew restless. "It is the will of God," sighed the tired voice. "I never got arrested when the mills were running. Only when work was slack in the fall. For assault you get put away thirty days—and battery—six months."

An instant the worn face quivered piteously and the bowed shoulders sagged forward; another moment, with the subtle tact of innate gentility, Delia had turned the conversation.

"May I speak, commissioner? I want to thank you kindly for my Christmas

¹The Massachusetts Prison Commissioners are appointed by the governor of the state for terms of five years. The chairman alone receives a salary. Miss O'Reilly is a member of the board.

present. Me making that talk, you might think I was looking a gift horse in the mouth. But a lone woman don't have many Christmas presents. When the warden told me I could have what I wanted, the fact is I wanted what I wanted."

"What was that, Delia?"

"Faith, my dear, you'll smile of course, but I wanted a book on the Panama Canal. Not a picture-book—I can read print, thanks be to God—but a real book. The truth is I wanted to know if it is to be a sea-level canal with salt water or a fresh-water canal with locks; and I wanted to know where they found the rock bed for the great dam, and I wanted to know how they looked to pile a lake-ful of water on the side of the cut and have it stay there through the rains."

"Why, Delia?"

The bird-bright glance wavered and fell to the good-conduct plaid spread tautly over the thin knees. A wave of color that accused and absolved rose slowly in the withered cheeks.

"Why, Delia?" urged the other woman softly.

"God help us," murmured the unsteady lips. "You have the right to ask. It is my place to answer. It is fifty years come spring, Commissioner, I went west with my uncle and aunt. He was struck with the fever a man never gets over—the hunger for gold. My aunt being a grand cook ran an eating-house for the miners, and I waited on table. I was good to look at in those days; at least there were plenty to say so. T'was a strange life we led. Men worked like slaves and ate like lords—and the pay-dirt piled up in cellar. Then my aunt died (peace be with her) and after that my uncle decided we'd go home. Well we knew what the Great Desert was—and us with gold tied up in bags. So we took ship by Panama. That was almost a lifetime ago—almost a lifetime ago."

"How long did you stay on the isthmus?"

The sleek gray head sank lower, the nervous hands made puckers in the plaid.

"Almost two years," said Delia, catching at courage with an obvious effort. "Ah! but it was a grand life those days in the canal zone. From Colon to Rio Grande 'twas the *jeunesse dorée* of France that was there. 'Twas wines and satins and masquerades. Nobody counted the cost. Everything came from the railroad and the plans they had for digging the big ditch. All day we slept from the heat. After that it was music and bull-teasings in the star-shine. Most of the men that were there planning out the Canal Company have their names down in history—they or their forebears. Commissioner, you'll live to see that France never has a day's luck after the way she treated the Comte."

"What Count?"

"What Comte? Glory be praised! As if there was more than one comte! Faith, 'tis the Comte de Lesseps I mean, of course. 'Twas him we were waiting for till he got rid of Suez. All the others could do little till he came. 'Twas the idleness that was to blame—that and the summer never ending. And a hundred men to one white woman along the line. It was so still you could listen all night to the trains rumbling across to Colon, and the roll of the sea in the wilderness. Nobody worked down there in those days. The very bread we ate was shipped from the state. Then—then the red year came, the rains were late, and the south wind brought the fever. Those that could prayed—but the black swamp was a pit of contagion. One night we heard the rattle of land crabs and the screams of wicked-eyed parrots in the jungle. Next day the earth quaked till the dead were tossed from their graves and the poison snakes swarmed into the houses."

"And you, Delia, what were you doing?"

Shame and sincerity looked from the beautiful brown eyes.

"That was more than forty years ago, commissioner," pleaded the unsteady voice, "more than forty years ago. But 'tis your right to ask, and 'tis my place to answer. Since I must, I must. 'Tis better I say it in French. You'll observe that 'tis French-French; 'tis not Canuck. 'Twas the *jeunesse dorée* of France

that was there. Young as you are, Commissioner, I suppose you know that 'tis always one man—at least at first."

And then, quietly and very simply, Delia told. Slowly and pleadingly the strained whisper lapsed into silence.

"And then?" urged the other woman.

The prisoner's manner and voice gathered courage.

"Then I came home. 'Twas only a name, of course, for I had no one belonging to me. And I went into the mill. Those were the days when you worked up to your ankles in wet, not seeing your neighbors for the lint from the carders. It was poor comfort to think of that Garden of Eden down on the isthmus. I had only to shut my eyes to see the fan palms and the trees dripping orchids. God knows I was fair desperate when there came a mission. It was an I'tal'ian priest that preached it—but he was a good man for all that. I never had great use for those till I heard they make popes of I'tal'ians. Was there ever an Irish pope? I don't know . . ." The attempt to digress was too patent. "He said," resumed the voice, made faint by memories, "he said God sent the Angel with the flaming sword to drive me out of the canal zone. He said I must never think of the flowers again—or the birds—or anyone that was there. He said I must be thankful to work in the mill and never be laid off. He said I'd be safer in a prison than out of work in the streets. It was the truth. I'm not denying it was the truth, but little he knew!"

"Delia," said the younger woman gently, "you know it was very wrong."

"Yes," answered Delia, humbly. "Of course I know. I've had forty years in the mills to think it over. Time was we couldn't see a neighbor for the dust of the carders. . . Now we can't hear a friend's voice for the noise of the looms. All day alone in the weave room—home at night too tired to talk—never a cent to spend for a pleasure: that's what it means to be forty years in the mills. Sometimes in the night—now I'm too old to be harmed—I think of those days in that Garden of Eden. Faith, I know it was wrong, very wrong, but—God pity us all—it was living!"

A MAN-MADE FLOOD

SOME ISSUES IN SOCIAL RESPONSIBILITY RAISED BY THE BREAKING OF THE DAM ABOVE AUSTIN

GRAHAM ROMEYN TAYLOR

Copyright by Underwood and Underwood, New York.

BODY OF WILLIAM NELSON—AUSTIN'S JEREMIAH.

By a coincidence, a locomotive in the background threw up a plume of smoke and steam above the litter as the bearers carried past the corpse of the man who in season and out of season had prophesied disaster. The thing he foreboded in the end killed him and killed his wife.

"I refuse to testify."

—This blunt answer given by the mill superintendent was the sum total response of the Bayless Pulp and Paper Company at the first hearing by the coroner's jury inquiring into the cause of the death of Martha Hess, one of seventy-six people of Austin, Penn., who lost their lives when on September 30 the breaking of the Bayless company's dam dealt destruction to the town.

Once more the question was asked, "Did the borough council of Austin ever notify the Bayless company that the dam was unsafe?"

The district attorney this time reminded the witness that the inquiry was made of him in his capacity as president of the borough council.

Again the answer, "I refuse to testify."

If you had been sitting that afternoon in the Austin school-house on the hillside overlooking the narrow valley of desolation, you might have fallen to wondering if anyone cared a great deal what sort of answer was made to any question connected with the case. You might have noticed that the room contained less than half as many people as would have been present if the dead themselves had been brought to life and assembled. You could not have escaped realizing that among your thirty-odd fellow attendants upon this most important hearing following the disaster there were scarcely a dozen who had ever seen any of the seventy-six victims alive. The individuals squeezed into the rows of little school desks and seats made up a company principally of outsiders—the six jurymen, the district

attorney, the acting coroner and the witnesses who came from elsewhere in the county, the deputy attorney general from Harrisburg, and a group of newspaper men from various distant cities. Austin townspeople—friends of those whose death was here for the first time the subject of official concern—could have been numbered on the fingers of two hands.

Your eyes wandered aimlessly over the bare school-room and fixed themselves vacantly on its blackboard, filled with the scribblings of the members of the state constabulary, who had turned the building into their barracks. Half consciously you pictured in mind the throngs hurrying along the busy streets in the crowded cities. What were they thinking about it? Probably it no longer came into their minds except as they casually noticed the dwindling newspaper headlines and despatches. Perhaps they had already made the mental comment, "Only seventy-six killed—not a tenth as bad as at first reported—just another case of newspaper exaggeration." You recollected other disasters and how quickly all discussion of them disappeared from press and conversation. You perhaps felt a little tinge of personal guilt—that you were one of the million

parts of "the public" that forgot so soon. The only reason why you would remember this disaster was because you had come to the stricken town. For a week your gaze on the utter destruction round about had been definitely focused only when the man at your elbow said, "Here comes another," and your eyes followed out of sight another white-sheeted object borne on a litter.

Even the week's experience seemed to melt into the gray blackness of the slated school-room wall on which your eyes rested so unseeingly. But your momentary musings ended as your ears caught the faint sound of the switch engine and derrick grappling with the wreckage down in the valley, and you stirred yourself. The district attorney was making another effort to get some word from the dogged superintendent, who seemed only slightly relieved when his attorney came to his rescue.

"We understand," said he, "that there are threats of criminal prosecutions following the hearing, and my client declines to testify on the grounds, first, of his constitutional right to withhold testimony which might incriminate him, and second, that the best and only evidence on the point in question are the records of the town council." Knowing that

"ANOTHER."

these records in all probability had been destroyed by the flood, the man of law sat down with an air of having outwitted the inquisitor. An indefinite adjournment was ordered, the district attorney announcing that he desired an opportunity to ascertain his authority to compel testimony from the mill superintendent. The assemblage shuffled out.

Not a satisfactory beginning in placing responsibility for Austin's disaster. Was it to stop there? Would social responsibility end even if this mill superintendent and the men who employed him were forced to admit that they maintained a dam that menaced two thousand men, women, and children? Would it end even if the law put them in prison for criminal negligence? Would it end with a full performance of their duty by the people's representatives—the district attorney of Potter county, and the six men who comprise the coroner's jury? Would it end even with everything the state of Pennsylvania can do, both in carrying out sanitary and relief measures in Austin and in enacting the best legislation which science can propose to prevent similar disasters? If so, the appearance of this article in *THE SURVEY* would be meaningless; its function might be better fulfilled by sending copies to the mill superintendent, his employers, the district attorney, the coroner's jury, state officials, and the members of the legislature.

The range of social responsibilities is still wider. They circle far out from that little meeting in the Austin school-house. And their challenge is charged with an insistence before which the little tricks of a lawyer's technicalities dwarf into less than the infinitesimal. They search into the very souls of Pennsylvanians who forgot Johnstown, of all of us who make up the forgetting public. Could we all have stood on the bleak Illinois prairie that November day when the mine shaft at Cherry was sealed and the women grouped around it realized their men were dead, we would not rest content before the mining laws of every state made life more secure. Could we have all stood by the bedside of Thomas Lawlor in the Austin hospital and heard him groan out that he would stand a

hundred times the pain in his shattered limbs if it would bring back his wife and his boy, we might not forget so soon our share in the responsibility for protecting life from unsafe dams.

The question which society was really asking the mill superintendent was not merely "Who was guilty?" but "Why did this disaster happen?" and "How can we prevent another like unto it?" By an illuminating coincidence, the witness whose refusal to testify balked the coroner's jury personified in one man the organized forces of society which had failed to protect the valley. As president of the council he stood for the town, the agency through which from earliest time just such households as were crumpled by the flood's sweep have sought mutual strength; as superintendent of the mill he stood for the corporation, the newer form of associated effort through which in modern times a generation performs tasks too gigantic for its individual members. In the emergency which ensued—but not in the months of anxiety which preceded it—the community reached out its hands for succor to the larger social organism, the state. It is, therefore, opportune to review the relationship of all these factors to this disaster, with the motive not so much of placing responsibility in this case—that is for the engineers and the courts—but to help public opinion in defining and reinforcing responsibility in such ways that the preventable shall be actually prevented.

Situated in a little valley of the Alleghenies near the New York state line, the town of Austin was dependent principally on two industrial concerns, the Goodyear Lumber Company and the Bayless Pulp and Paper Company. Lumbering operations have nearly come to an end on the nearby hillsides, and it was rumored in Austin that the Goodyear company was to abandon its operations in another two years. The Bayless mill—utilizing the remaining pulp wood in the manufacture of paper—was consequently looked upon as the main dependence of the town. The washing process in the mill required much water. To secure a supply, a

ABOVE AUSTIN—THE BROKEN DAM IN THE DISTANCE.

reservoir was made years ago by damming Freeman's Run, the small stream which flows through the valley and farther down joins with another to form the Sinnemahoning river. As the mill grew this reservoir became inadequate; it frequently went dry in drought times. Consequently, in the summer and autumn of 1910, the Bayless Company constructed a new dam of concrete further down stream, at a point still a mile and a half above Austin. Their mill stood midway between dam and town.

It was the failure of this new concrete dam which caused the disaster five weeks ago. The floor of the valley has a width here of from 500 to 1000 feet. On each side the hills rise sharply to a height of several hundred feet. At Austin the main valley is joined by another smaller one through which the Buffalo and Susquehanna railroad enters. The only surviving houses of the town are the ones which were scattered up this tributary valley or were located on the hillsides. The business center with most of the dwellings occupied the full width of the valley floor. While a main street crossed the valley at right angles there were few other streets paralleling it, leading to the hills on either side—the only way of escape. The population of the town, according to the 1910 census, was 2941, but the census-taker estimated that about 600 people had moved away, owing to slack work at the saw-mill, so that it is supposed there were in the town on the day of its destruction about 2300 people.

The disaster of September 30 was not the first time the dam had shown its weakness. Completed about December 1, 1909, it suddenly filled with water in the middle of the month succeeding, when a thaw and some rain melted the heavy snows. Water seeped up below the base of the dam and twenty-four hours later, on January 25, 1910, the structure cracked in several places and 200 feet of it slid forward as much as eighteen inches at the point of greatest movement, while the top bulged thirty inches.

Greatly alarmed, the people of Austin fled to the hillsides, some of them to camp out for two or three days. Household goods were taken from dwellings and stood in wagon-loads along the road leading up the tributary valley. The Bayless company shared in the anxiety—indeed, mill officers had helped to warn the town—and took prompt measures to relieve the pressure. With dynamite they blew two gaps in the rim of the dam, thus quickly lowering the water depth backed up behind it to about thirty-seven feet. Still the townspeople feared for their lives. The water pouring down the face of the dam made it difficult to open a thirty-six inch clean-out pipe which penetrated the base. This was also accomplished by dynamite, and sixteen hours later, the dam empty, the people of Austin reentered their homes with a feeling of security.

The various steps taken by the company in once more putting the dam into

WRECKAGE WHICH SURGEL AROUND THE SAW-MILL.

operation will be taken up later. Following the early fall rains, the water on the morning of September 30 last poured over the spillway for the first time since the accident eighteen months back. In the early afternoon the dam gave way. The few witnesses agree that suddenly about 150 feet from the western end a volume of water—said by one witness to have been six or eight feet in diameter—spurred through a hole. In scarcely the time it takes to tell it, a great section above this hole was forced out. That broke the dam's back and the whole structure caved out in seven large sections. The two end pieces clung to the hill slopes, the rest slid forward from fifteen to twenty-five feet, and one section swung around like a huge gate. Resistless as was the rush of waters, the wires were quicker. Messages were sent from a nearby house to the pulp mill and to the "central" at Austin, where three young women telephone op-

erators exhibited as great calmness as was shown in the whole disaster. They stuck to their posts in the path of the flood, making the call that started the alarm whistle and ringing up other places with their word of warning. Not till they saw the toppling of one of the church steeples did they rush down stairs and scramble up the hillside, which fortunately was within a few steps of their building. A moment later, the crest of the flood, with a frame house as its sledge, battered down upon the exchange building and wrecked it. If you want to know the quality of courage with

which these girls, Kathleen Lyon,¹ Lena Binkey, and Hazel Knapp, met the test, read the Chief Operator, a story by Elizabeth Stuart Phelps in *Harper's Magazine* for October, 1909.

Scarcely eleven minutes elapsed between the sudden breaking of the dam

It is reported that the telephone company has presented a gold watch and a check for \$250 to Miss Lyon and has given cash rewards to the two other operators.

Commissioner of health of the state of Pennsylvania, who by common consent assumed direction of the work of relief and rehabilitation.

and the rush of the breaker upon the town. Those who saw it come unite in saying that the water itself was scarcely visible—it was a wall of crashing, splintering, tossing pieces of wreckage. Thousands upon thousands of cords of pulp wood had been picked up near the pulp mill and pushed like a battering-ram against the town. The first houses were merely added to the grinding mass which was disgorged down the valley for miles.

Details of the disaster—the wild dash for safety from store and office, from dwelling and factory and polling place where a primary election was being held; the heroism of those who tried to lead dear ones to safety; the frantic hill-side searchings of parents to find children, and of husbands and wives to learn each other's fate; the futile struggle to extinguish the fires which broke out in some of the wrecked buildings; the arrival of relief; the weary search for the victims—have been sufficiently described in the daily press. Had the dam broken during the night, there can be little doubt that the number of dead would have mounted up to the figures first estimated. But whether 1500, or seventy-six, or even one, the essential

facts, so far as social responsibilities are concerned, are the same.

And, as it was, not merely roofs and store fronts, but the organized fabric of community life was shattered by the flood. The state government responded in the emergency, gathered up the reins of control, and met the immediate problems of sanitation, relief, and public order.¹

The department of health of the state of Pennsylvania, with Dr. Samuel G. Dixon at its head, lived up to its reputation for energy and effectiveness. Within two hours after the disaster Dr. E. H. Ashcraft, county health officer and representative of the department, had arrived at Austin and was caring for the injured. Of these there were fortunately but eleven, and the town hospital, which stood on one of the hill-sides, had providentially been spared. Commissioner Dixon assumed the initiative at Harrisburg—Governor Tener being in another part of the state—and sent a relief train with surgeons, sanitary engineers, physicians, nurses, and medicine. This first relief train reached Austin at half-past six o'clock on Sunday morning. The governor on Saturday evening, as soon as he heard of the disaster, communicated with Dr. Dixon, with the adjutant general of the Pennsylvania national guard, and with the commander of the state constabulary. A second relief train in charge of Major M. E. Finney, with food, clothing, and tents enough to shelter 1000 people, arrived Sunday forenoon, as did the two troops of state police. By eleven o'clock Sunday morning the situation was in charge of these divisions and a conference had been held with the burgess and town council. The two Austin men who had taken the federal census of the town in 1910 were commissioned to list rapidly all survivors and prepare a roster of those known to be dead or missing. A morgue was established in a vacant house, and as there was no coroner in Potter county an officer of the state Department of Health was put in authority.

Nurses were placed in charge of the commissary, which was opened on the ground floor of a frame building. A

¹See THE SURVEY for October 14, 1911.

lodge hall above was used as headquarters for all departments, a local committee was formed to help the nurses in their distribution of food, and as a considerable number of houses had been unoccupied owing to slackness of work at the saw-mill there was shelter enough ready at hand for all.

The largest immediate problem was that of sanitation, and this was addressed under the direction of F. Herbert Snow, sanitary engineer of the state Department of Health. The Pennsylvania Railroad had sent in 125 men and these at once started the work of recovering bodies. The water-supply was given early attention. When the pipes had been reconnected, the water was

GENERAL HEADQUARTERS.

RELIEF RATIONS.

found to be dangerous to health. Warning notices were posted throughout the entire locality, and people were urged to carry their water from one source known to be safe. Meanwhile, a "treatment plant" was hastily established to render the general supply potable by the use of chloride of lime. Two cases of scarlet fever in the town were found to be well quarantined by the local health board. Gas had been the chief fuel for cooking in Austin and a quick resumption of supply by the gas company was secured. A temporary telephone exchange was installed at the hospital by Sunday afternoon, and linemen soon brought all parts of the community into touch with headquarters.

Supplies and money began to come from many cities and towns in and out of Pennsylvania, Johnstown, which years before had gone through a more harrowing ordeal, being among those earliest heard from. Supplies were needed even more than money, for within a very few days the stores and markets for miles around had been exhausted. Shipments to the stricken town were handled free of charge by the railways.

Philanthropic agencies offered their co-operation at once. Ernest P. Bicknell, national director of the American Red Cross, arrived Sunday and found the situation so well handled by the state health authorities that Red Cross help was unnecessary. Red Cross offers of

GETTING A DAY'S PROVISIONS FROM THE COMMISSARY.

AT WORK IN THE WRECKAGE.

The Pennsylvania Railroad sent 125 men at once to Austin. The state soon mustered a force of over 1,200 men, including 450 survivors.

help were brought also by Frederick Almy and Thomas F. Cooke of the Buffalo Charity Organization Society, a Red Cross institutional member. In response to the governor's directions, the executive officer of the Pennsylvania State Board of Charities, Bromley Wharton, and an assistant went to Austin immediately. The Pennsylvania Children's Aid Society sent a special agent, H. M. Peck, to offer help in caring for dependent children.

The problem of relief was less difficult than it might have been. There were practically no children left dependent, for of the seventy-six victims but fifteen had been bread-winners. These were either single men or else their dependents had been killed with them. Over forty of the dead were women and the remainder were children. For the present, many of the survivors will remain in Austin, but a considerable number have already left the desolate place, many going to

relatives and friends. The Pennsylvania Railroad and the Buffalo and Susquehanna, which connects with it from Austin, have given free transportation to survivors vouched for by the local relief committee. Of immediate help to survivors, also, has been the employment offered 450 Austin men as part of the force of nearly 1,200 mustered by the state to remove the wreckage. This has meant ready money to many families which had been left penniless. It is likely that the hope of a large relief fund in which they may share has tended to keep survivors at Austin, for while practically all have lost employment, some have lost the accumulations of a lifetime. By far the greater part of the contributed supplies and money have come from cities and towns within Pennsylvania. The state has had no emergency fund which could be drawn upon, but the Department of Health has

THE MOTHER OF SIX CHILDREN—ALL LOST.

Mrs. Ralph Donafierro and her children were at home when the flood broke. Her husband, an Italian shoe-maker, called to them. They had only reached the street when one little one was frightened and ran back into the house. Mother and father ran back to save it. Before they could escape, the building was overwhelmed and the entire family was killed.

been able to apply part of its appropriation to the immediate tasks undertaken.

No account of the state's efforts would be complete without mention of the police duty rendered by the constabulary under Captain J. W. Robinson. With reasonableness and unusual tact, with no officiousness, these men quietly reduced chaos into as much order as could be expected. In maintaining the necessary lines, it was not a gruff, "Get out o'there" or a surly command to stop, but a pleasant "Hey there, partner!" followed by a quiet, firm word of explanation. But they were like a steel trap for the few who attempted looting.

This handling of the situation *after the fact* has been of an order to command admiration. Had the disaster been due to an earthquake—and thus outside the bounds of human caution—such high-class salvage work would end the

story. Had it been due to the eruption of a volcano, the public could do no more than express perplexity at the stubborn blindness of vineyard folk who persist in living in the danger zone, and point out to them that their foolhardiness hazards not only their own lives but those of their wives and children. But here was a disaster in which human agency was clear. The townspeople had the same chance as the vine-growers to evade it. They had more than that. The dam was man-built, man-controlled. If they themselves were helpless to control it, they might have appealed to those who could—to the owners of the water-power, or to a larger public. More, not townspeople alone, but the company who built it, the engineers, and the state bore each a special relation to the disaster and to the human elements which, no less than the struggle of cement and

water for mastery, had gone into the rending of the dam and what followed.

Turn first to the social responsibility of the townspeople themselves. The state authorities state that no complaint from a citizen of Austin is to be found in any files at Harrisburg. Nor, according to the testimony of the clerk of the town council, did that body ever notify the Bayless company that it considered the dam unsafe. Personal talks with the members of the council brought the uniform confession that the matter was never discussed in that body.

Did the people of Austin appreciate their danger?

If so, did they do anything about it?

The panic in Austin when the dam partially failed in January 1910 shows their alarm at that time, and there is less spectacular evidence of a very definite undercurrent of fear subsequently. The pastor of the Methodist church, the Rev. E. E. Harter, recalled that every heavy storm caused anxiety.

"Many are the nights," he said, "that I have lain awake listening to the rain on the roof and thinking of what might happen if the dam gave way."

"My wife," said druggist V. R. Midlaugh, "seemed to have it on her mind all the time."

The women worried most. There is Mrs. W. E. Brady, for instance, whose husband was one of the managers of the department store. "I couldn't keep my mind off of it," she said, "and my husband and I talked it all over times without number. We wanted to get rid of our business here and leave—in fact, we were hoping to do so in another three months. Now we have only the clothes on our backs to show for our twenty-five years in Austin. I kept planning just what I would do if the dam broke, and months ago I had my son Stewart cut the wires of the fence at a point between our house and the hillside. I owe my life this day to that, for I had scarcely crawled through the opening when the flood rushed past."

No more heartrending scenes took place during all that terrible day than along this fence where numbers of people, their hands frantically clutching at

the barrier, were snatched by the roaring wave of destruction.

Even the outsiders who occasionally visited Austin perceived the danger. A railway official—who, by the way, rendered important service in the work following the disaster—happened to be in Austin last August and took a look at the dam. "That night in the hotel," he says, "I could scarcely sleep."

There was one especial prophet of disaster—Henry Nelson, who kept the grocery store on Main street. The thing he foreboded killed him and killed his wife in the end. Whenever he had a spare hour or two he was likely to hitch up his horse and drive off for another look at the great white wall above the town, even if he had done the same thing but the day before. His agitation was known to every citizen of Austin.

We are informed by a leading Pennsylvania attorney that neither the town nor the public were without adequate legal protection. He says:

The town authorities, for the protection of the town property, could have brought a bill in equity in the common pleas court, setting up the facts, and asking for such action as was necessary to protect its property rights, and any citizen of the town of Austin, or any number of them, could have combined in an action by bill in equity in the same court, praying for such relief as the facts and circumstances warranted. That is, they could have set up the danger and demanded the removal thereof, either by further structures, or, if necessary, by the destruction of the dam itself.

There was ample power, therefore, in the courts of the county to have dealt with the danger, if apprehended, and such danger had been brought to their attention by those directly involved.

The courts were open, also, to the parties in interest, through the law offices of the commonwealth, by a proceeding to abate a nuisance, treating the dam in this wise.

Why was it, then, that no collective protest was made by the people of the community? The answer is perhaps sadder than the little processions which tracked the wet ground about the morgue. It shows a predominantly American community so saturated with dependence upon an outside power from which it drew its livelihood that its very instinct for self-preservation was inhibited. Nor has it so far recovered itself, under the sting of disaster, as to express

an appreciable resentment toward those in whose power it was to do whatever might have been done to remove the danger. Two weeks after the catastrophe, not even a damage suit had been started! When a lawyer of distinction (not inexperienced in defending corporations from unwarranted claims) was told of the situation he exclaimed:

"Found: a social value for the ambulance-chaser! What Austin has needed is a trainload of contingency lawyers."

The dam which wrought their ruin had meant steady work to the wage-earners of Austin and trade to its merchants. The summer previous to its construction there were several weeks of idleness because there was not enough water for the mill. The dam remedied this; took away the menace of occasional unemployment and, in so far as it was weak and insecure, substituted the menace of annihilation. To sell goods or practice law or rent houses or have subscribers to a newspaper you must have people in your town. The people must have a means of subsistence. As lumbering lapsed, the empty houses on the hill had grown in number. The Bayless mill and its running was more and more the main dependence.

Why, many still ask, did not the town government of Austin concern itself with this vital phase of the people's safety? The members of the town council agree that it was never discussed by them officially. A member of the board of county commissioners states that that body also never considered the matter—although the dam and mill were both outside the borough limits of Aus-

tin and in their jurisdiction. Who were the town officers? F. N. Hamlin, superintendent of the Bayless mill, was president of the council. Another member of this body of seven was the master mechanic at the mill. "With Hamlin as president," remarked one of the other members, "it would have taken a pretty good man to get up on his feet and say anything about the condition of the dam." Who was the town burgess? Michael Murrin, superintendent of some outside work for the Bayless mill. Were these

men as town officers likely to make a protest about the dam to the Bayless company? The following telegram sent six days after the tragedy is sufficient commentary:

Austin, Oct. 6, 1911.
George C. Bayless,
Binghamton, N. Y.

The sentiment of Austin people with you and your company. We want the mill rebuilt and Austin rehabilitated. Can assure the hearty co-operation of our entire people to that end.

M. MURRIN,
Burgess of Austin.

To be sure, the townspeople have a natural desire to see value restored to their real estate and such other property as has escaped by the rehabilitation of the mill and the resumption of work there. And the company no less than townspeople has been struck a heavy financial blow. Yet the man whose signature is attached to the telegram admits that, when he sent it, there had been no meeting of citizens, no adoption of resolutions, that he merely "talked with a few" whom he "happened to meet."

Was it the pen of Michael Murrin, burgess of Austin, or of Michael Murrin, employe of the Bayless company, that wrote the message?

MICHAEL MURRIN,
Burgess of Austin and employe of the Bayless company.

A resident of standing tells of going with grocer Nelson on one of his drives to the dam.

"We had come to the house of Superintendent Hamlin," he says, "and Hamlin asked us where we were going.

"'Up to the dam,' we answered.

"'Seems to me you fellows are badly troubled about the dam,' said Hamlin.

"'All I've got is below it,'" retorted Nelson.

"'Do you think,' replied Hamlin, 'that we would have built the mills below it if it weren't safe? You had better quit disturbing people's minds, or it will hurt your business.'"

Not only were town officers employees at the Bayless mill, but the leading public man in Austin was the local attorney for the company. With all the depth of sympathy one must feel toward Frank E. Baldwin, one cannot escape the conviction that here was the pivotal man in the community. With his responsibilities both as attorney for the owners of the dam and as a senator from the district; with his thirty houses which he rented destroyed; with a crippled father, a blind mother, and a sister who heroically tried to lead them to safety, all among the victims, Baldwin was the man who, by position, ability and experience in public service might have been expected more than any one else to find a way to ward off the danger. Yet even he, with all that he had at stake, seems to have taken the chances that all were willing to risk.

It is seen, therefore, that the old forms through which communities from the beginning of civil history have secured self-protection, through which medieval towns built their walls, through which our American pioneers built their stockades and block-houses against the Indian, had to a degree lost identity and been absorbed by a modern social institution—an industrial corporation, which held public action in the hollow of its hand, just as the hills held the town in their cup. This is no sufficient excuse for the decadence of initiative and self-assertion on the part of Americans. But it makes us inquire how, and with how keen a sense of responsibility, the corporation and those who controlled it ful-

filled this stewardship which had encroached so far upon democracy.

We have sketched the development of the pulp mill's water supply; we can take it up from the point where the slip of January 25, 1910, gave warning to the company, even more than to the community, of the weakness of their dam two months after its completion. The dam, designed by T. Chalkley Hatton, engineer, and built by the C. J. Britnall Company of Binghamton, N. Y., was about 544 feet in length, two and one-half feet thick at the top, and thirty feet thick at the bottom, and high enough to hold a head of forty-seven feet of water to the top of the spillway, which was two and one-half feet lower than the top of the structure.¹ Its capacity was about 350,000,000 gallons. Following the slip and the subsequent dynamiting, the editors of *Engineering News*, impressed by what seemed a "most unusual method of treating a dam, particularly one just completed," sought information about it from the engineer, and in the issue of March 17, 1910, printed an article based upon Mr. Hatton's response. It is not essential to the purpose of these pages to detail the engineering facts there set forth, though in the light of what has happened this whole article affords what seems to the layman a plain prophecy of disaster. Merely a few of the facts from Mr. Hatton's response are here summarized:

During construction, the Bayless company directed that the dam be built to hold more water than called for by the original design.

The concrete was hurriedly built, some during freezing weather, and had not set so as to attain its ultimate tensile strength before subjected to maximum pressure.

The most important cause of the slipping was water getting under the dam—a condition not anticipated and against which all precautions which seemed necessary had been taken.

The outward movement of the center of the dam was due to the water getting under the foundation, softening up a stratum of clay or shale lying between two layers of rock, and permitting one layer of rock to slip forward about eighteen inches upon the lower layer.

Leakage under the dam, after its movement, showed a discharge of 600 gallons a minute.

Water getting under the dam at a depth of six feet below the concrete base exerted a much greater upward pressure than was anticipated . . . and reduced the factor of safety against sliding to an unsafe limit.

¹Technical facts and description are mainly from *Engineering News*.

Following this slip, the Bayless company asked the advice of Engineer Hatton as to what repairs should be made. In preparing his recommendations, Mr. Hatton consulted Edward Wegmann, Jr., formerly chief engineer of the New York Aqueduct Commission, and now consulting engineer of the Department of Water Supply, Gas, and Electricity of New York city, and author of a well-known treatise on dam construction. Their plan for strengthening was to build additional masonry as a reinforcement on the down-stream face of the dam and to sink a cut-off wall at the up-stream face

and *Engineering Record*, who visited Austin after the disaster of September 30, report that nothing had been done to carry out these recommendations of Messrs. Hatton and Wegmann, or to strengthen the dam in any way.

From the standpoint of safety there were apparently, in view of the explicit statements of the engineers, but two possible courses: either to carry out the recommendations or to let the dam remain empty. Neither was followed. The dam was allowed to fill, though the two gaps which had been dynamited in the top were left and thus kept the water

Copyright by A. Newman, Rochester.

THE FLOOD-GATE OF DESTRUCTION.

down to an impervious stratum, so as to prevent percolation under the dam. It is worth noting, says *Engineering News*, that Mr. Wegmann was not asked to visit the dam site and view the condition on the spot, and that he was not employed by the Bayless company but by Mr. Hatton himself. Mr. Hatton states:

The plans and recommendations were submitted in February, 1910, since which date I have had no further connection with the dam and do not know what measures were taken to reinforce it.

Representatives of two authoritative technical publications, *Engineering News*

at a level considerably lower than the top of the spillway.¹ The most extraordinary disregard of safety was still to come. Without apparently turning its hand over to strengthen the dam, the company actually set about stopping up

¹President G. F. Bayless is reported as having made some explanation to the effect that a forty-foot head of water was sufficient for the mill and that during dry weather a man had been kept at the gate to regulate the amount of water and keep it at the height that was necessary; but that his man was not stationed there at the time of the accident, as it was not thought necessary to have him remain there. *Engineering News* points out that this is obviously "the sort of explanation which does not explain," and that if safety had been at all thought of in connection with the employment of a man to regulate the height of the water, he would have been on the job in rainy and not in dry weather.

A "HOME" IN THE PATH OF THE FLOOD.

the gaps. One of them had already been filled with concrete. The wooden forms were in place and bags of cement were piled on the hillside near the other at the western end of the dam. But this work was never finished. Rain set in; and by the morning of September 30, according to testimony given at the inquest by A. C. Silvius, a state forester, the water had risen nearly to the top of the spillway.

"I saw M. C. Bailey, an employe of the Bayless company, who seems to have had the duty of inspecting the dam," said Silvius. "I told him I didn't believe the dam was safe, and asked him what he thought about it. He said he didn't know about it but guessed he would go to see Mr. Hamlin (the joint mill and town official whose refusal to testify has been brought out). I added that I thought the gate¹ of the dam ought to be opened." The name of M. C. Bailey was called at the inquest. He was absent.

Another eye-witness, H. W. Faulber, state inspector of highways, testified that early in the afternoon of September 30 he saw water spurting through

¹Just what was meant by "the gate" is not entirely clear, but it evidently referred to one of the openings heretofore mentioned by which the pressure could be relieved.

the board forms for the concrete intended to block up the remaining gap at the western end of the dam. It was now pouring over the spillway.

In other words, there were just two times in the history of the dam when it was full. On one of these occasions it slid eighteen inches at the bottom, bulged thirty inches at the top, and cracked in a dozen places. On the other, it gave way entirely, devastated a valley, destroyed the greater part of two towns, and hurled seventy-six human beings to their death. Yet the total public explanation thus far made by the operating company responsible for its erection and upkeep is summed up in the statement of its superintendent, "On advice of counsel; I refuse to testify," and in a meaningless expression of sorrow by one of the Messrs. Bayless of Binghamton, New York, beginning, "I am simply overwhelmed with surprise and grief that the town has been so afflicted."

Perhaps, after all, you or I could have let things go just as did the Bayless company. We may think ourselves public-spirited. Then read this portion of a letter which we print in simple justice. It comes, solicited by us, from a professional man in Binghamton:

Throughout the whole community these men stand well. They are exceedingly fine characters—capable, honorable, and public-spirited. Mr. George Bayless has served the city very efficiently as mayor. They are liberal in their help to some of the most worthy causes in the city, and their wives also are similarly interested. Mr. Franklin Bayless is very devoted to the work of a boys' club, an institution that means the training and uplift of lads that might otherwise become a menace to society.

I have talked with many people since the terrible disaster at Austin, and I have not yet heard one harsh or bitter word against either of these men. The general impression seems to be that they paid for the most reliable advice of experts, and that they did not even dream that the dam was unsafe. Tremendous financial interests were at stake as well as precious human lives, and we cannot bring ourselves to believe that the company would deliberately play fast and loose while such great interests were imperilled.

I am not greatly surprised that neither of them went to Austin. I saw them both for a few minutes on the day following the disaster. They were utterly prostrated. Neither of them is physically robust or rugged. They are sensitive, highly strung men—and the blow nearly killed them. I seriously doubt whether they could have travelled to Austin at that time. I happen to know that Mr. George Bayless was so utterly prostrated by the event that his condition was such as to cause his medical adviser some anxiety.

I have said some pretty severe things against greedy corporations and soulless capitalism, and I suppose I belong to the radical wing

of modern economic thought. But I must do what justice I can to the characters of these men—a matter standing altogether apart from any economic or fiscal theory.

Many of us are convinced that some error in calculation must have caused this awful disaster. I believe entirely in the integrity and conscientiousness of the Messrs. Bayless, and I think I have had exceptional means of judging.

I may also say that the Board of Directors of this company is made up of a superior type of men—men of kindliness, public spirit, and irreproachable integrity. I am quite sure that any average jury of our citizens would endorse, and perhaps emphasize, every word I have written.

Yet how far the Bayless company and its officers were responsible for the disaster, in the opinion of one of the most widely known technical authorities in this country, may be gauged by these two sentences from an editorial in the *Engineering News*:

"It is our duty to say that the occurrence is without excuse; and that if the dam had been built with proper precautions and proper regard for safety, the failure would never have occurred. . . . It was bad to build the dam on such a foundation, with no greater precautions to prevent water getting under it; but it was ten times worse to attempt to use the structure in its weakened and perilous condition after the partial failure of 1910."

According to the leading engineering journals, the responsibility of the

DEBRIS PILED AT ONE SIDE OF THE VALLEY.

company for the disaster is thus clear-cut. Yet it is to be said that the officers and directors are not technical men, with an engineer's grasp of tension and stress and the other factors in concrete construction. Whether or not they disregarded the advice of the engineer employed by them, the responsibilities of that profession do not seem exhausted when advice has been given to a non-professional board of directors, any more than in a similar case—when the life and death of many are at stake—the public responsibility of a physician is circumscribed by cautioning a man suffering from a contagious disease that he keep off the street. We have yet to see a statement convincing in its details to a layman that, through borings or other means, sufficient precautions were taken in the original construction of the dam to see that it had a solid foundation in bed rock. There has been a movement among progressive men in the engineering profession to insist that in these big structures expert geologists be called in to determine the nature of the ultimate underpinning of things. All precautions may well have been taken; if so, it should be demonstrated beyond all peradventure.

The *Engineering News* has recently stated that it has

heard intimations that Mr. Hatton desired in the original construction to carry a cut-off wall deep down through the soft rock strata so as to cut off possible percolation under the dam; but was overruled on account of the expense which would be involved.

We need further light as to whether the designing engineer at Austin—a man of good record—met the requirements of safety which the common opinion of his profession would demand, but we need to know further where, as here, life was likely to be at stake and the interests of the community needed protection, whether the ethics of the profession demand that the responsible engineer insist on those standards or quit the job. If not, then the engineers set lower standards than those sanctioned—though not always lived up to—by the older professions.

Question of professional responsibility also enters in at the point where Engi-

neer Hatton told the company that certain reinforcements were needed to make their cracked dam safe. He did not tell that to the community living in the path of the impounded reservoir at the time or in eighteen months succeeding. So long as the engineering profession permits a situation whereby no channel is open through which a responsible engineer who knows the danger in his professional capacity can conserve the safety of human beings against the ill-considered action of a board of laymen, the question of moral obligation is bound to be raised by such a catastrophe. The reporting by engineers of dangerous dams or other structures threatening to the community—much as physicians report centers of infection to boards of health—bears on the question of state regulation which will be discussed later. But even under present conditions, channels of publicity, both within and without the profession, are open.

The Austin disaster has been made the text by the Philadelphia *North American* for a vigorous arraignment of what it considers lapses in public responsibility within the profession. It reprints the verdict of the *Engineering News* after the disaster (from which quotation has already been made), that the dam had been "a veritable sword of Damocles hanging over the village below," and cites that

In 1910 The *North American* sent a staff representative to Austin. He told of the peril in which the town lay. Three months later, the *Engineering News*, in its number of March 17, 1910, gave voice to the orthodox engineering view, with dignified and well merited rebuke to the sensational newspaper reports of the threatened destruction of the town.

The words of the *Engineering News* were: "We have since learned that these reports were exaggerated."

To the mind of the Philadelphia *North American*,

There spoke the voice of the true conservative. Sensational newspapers were giving exaggerated reports of what might happen to Austin, when the only evidence they had of an impending flood was that a concrete dam 600 feet long and fifty high had been moved forward on its base eighteen inches, had bulged at the top thirty-one inches, and had cracked in several places.

We do not bring any indictment against the *Engineering News*. We merely offer it as a perfect illustration of a frame of mind, a certain kind of mind. This mind calls itself conservative.

A genuine conservative is one who conserves, who saves. The kind of conservative who sees sensationalism and exaggeration in a newspaper warning of the danger in a cracked and sliding dam is the same conservative who discerns only sensationalism or demagogery in the warnings that the old dam of privilege is split and is sliding on its foundation.

This mind sees only the vested interest in the dam and not the lives or the individual property that is below it. It does not know that true conservatism consists in building a new dam on the solid foundation of the rights of man as superior to the rights of property, and that those who demand such action are urging the only course that will prevent a social cataclysm which will cost infinitely more than the value of the vested interest, just as Austin's flood cost 100 lives and property of 100 times the value of the murderous dam.

Without discussing the lack of technical accuracy which the *Engineering News* may have noted in the daily press accounts, or the greater effectiveness which real warnings sensationally made might have if there were less "false alarm" sensationalism in the metropolitan dailies, it is worth while to examine this challenge to the engineers. The *Engineering News* included vigorous warning about the unsafe condition of the dam in its article of March, 1910, though it put it at the conclusion instead of at the forefront of it. So the matter reaches deeper? Where were the engineers of the state of Pennsylvania during the eighteen months that this dam "was a veritable sword of Damocles"? If an epidemic had menaced the health of 2300 people we should have considered it the duty of the medical profession to have pointed it out and initiated a movement speedily to end it. May not the public fairly ask that with respect to public safety the engineering profession show the same sort of spirit and activity we are beginning to expect from the medical profession with respect to public health?

From the American Society of Civil Engineers a committee, consisting of some of its most distinguished members, visited Johnstown after the disaster to that city twenty-two years ago.

They made a report. It dealt with the engineering problems shown by the demolished dam, and it doubtless has been of great value in spreading abroad a sounder technique of dam erection. But it failed entirely to deal with possible legislative measures which might have assured a more general living up to those standards. Nor is there any evidence that the engineering profession in Pennsylvania made any effort on the basis of that report to secure the enactment of any law looking toward the more adequate protection of the people of that state, though the *Engineering News* twenty-two years ago declared that the time had come for establishing state supervision, in the interest of public safety, of all public dam construction.

The weight of the influence of the engineers of Pennsylvania is easily sufficient to have forced the proper strengthening of the Austin dam had they brought that influence to bear. Certainly the public sentiment they could easily have aroused would have done so.

It is because he respects the knowledge and efficiency of the engineer—and not because of any distrust of them—that the average man feels a little like taking him to task. We covet for the public welfare the greater application of his knowledge and ability to just such situations as that which existed at Austin. The technical periodical we have so often quoted assures us that

there is no mystery in the art of dam construction and no problems in their design which competent engineers are not capable of solving with accuracy and reliability,

and then declares that

these disasters occur because too frequently those who build these structures buy just as little engineering and buy it just as cheaply as they possibly can.

This refers in part, no doubt, to the fact that after the Bayless company secured recommendations and plans for the strengthening of its dam it no longer retained the engineer and made no effort to carry out the recommendations. Our point is that if the engineering profession had led public sentiment in this very case, the company concerned might have seen a great light and utilized

all the engineering skill it could command to put its dam in a thoroughly secure condition.

This discussion of the responsibility of a great professional group to secure compulsory standards of safety in the field it practices in brings us to the ultimate responsibility of the state itself, of which the town of Austin is a minor civil division, and to which the manufacturing corporation is legally subordinate.

The promptness and efficiency shown by certain state departments in meeting the subsequent emergency is in striking contrast to the utter failure of the commonwealth to prevent the suffering it assuaged. Let us turn back twenty-two years to that dark day when a tide of destruction swept down the valley of the Conemaugh, engulfed the city of Johnstown, and carried off 2,140 lives. There also was a dam which had been suspected.

AUSTIN BEFORE THE FLOOD.

Town government, mill company, and professional group,—in forefending against the final disaster these three social institutions were as weak barriers as the dam itself. If one were looking for a sardonic contrast it would be that at the crisis it was an outcast social institution which happened to reach out more aid than all three combined. The warning to Austin was telephoned from a house of prostitution on the hillside near the dam.

A mine owner, after causing it to be examined by his engineer—so it is reported—brought its condition to the attention of the sheriff and urged him to take action in the courts to compel the owners, the South Fork Fishing and Hunting Club, to make it safe. The sheriff instead went to the Cambria Iron (now Steel) Company for consultation. An employe of this company looked at the dam and said there was no cause for alarm. Nothing was done. It is of

interest to record that there was received at Austin a check for \$1,000 from the Cambria Steel Company of Johnstown.

Following the disaster an editorial appeared in the *Harrisburg Patriot* for June 3, 1889, which in the light of subsequent events is strikingly significant. Change a few local words in your mind as you read it and observe how peculiarly it applies to the present plight of Pennsylvania, although it is the idea of pre-

and the dam could be compelled to respect? Either somebody has blundered or somebody has had but a light regard for human life.

The fishing club which owned the Conemaugh dam is sharply criticised for its negligence in repairing the walls which confined the large body of water. It is alleged that the club had been warned that the walls leaked at several points but that it paid no attention to the warnings. If this be the fact the members of the club ought to be held to such legal accountability as may be enforced against them in the courts. No man or body of men has any right in morals or in law to engage in either business or pleasure in a way that

AUSTIN AFTER THE FLOOD.

vention rather than retribution which we would today emphasize:

Now that the shock of the dreadful news is spent people are beginning to ask, Could the terrible event have been averted? Why was the boom in a river on one side of the city of Johnstown, which was a continual menace to its safety, suffered to exist? And why was the dam of the fishing club on the other side of the city, which it was feared might at any time break and hurl destruction upon the human life below, permitted to remain? Were the authorities of Johnstown indifferent to the safety of their city, or had they no rights in the premises which the owners of the boom

threatens the lives or property of others. The causes of the Johnstown disaster should be made the subject of legislative inquiry, and if there be no law to prevent and punish such reckless indifference to the safety of human life as seems to have characterized the conduct of the owners of the Stony Creek boom and the Conemaugh dam, it is high time that such an enactment were placed upon the statute book.

The commonwealth of Pennsylvania stands convicted by her Austin disaster. Her "high time" of legislative opportunity was twenty-two years long. A

search of her legislative records reveals no semblance of constructive legislation following Johnstown. Her memory could not last even the twenty months to the next session of the legislature.

It appears to be incumbent upon no department of state government, without a specific act of the legislature giving the necessary powers, to take of itself the initiative to discover such a condition as existed at Austin. It is stated moreover on behalf of the state Water Supply Commission that its files contain no communication apprising it of the condition of the Austin dam. Had such a complaint been sent to it, the extent to which the police powers of the state could have been called into play is a question for the lawyers. The Water Supply Commission was created in 1905 to gather data concerning the water supplies of the state and

adopt such ways and means of utilizing, conserving, purifying, and distributing such water supplies in such a way that the various communities of the state shall be fairly and equitably dealt with in such distribution.

It was also directed to recommend legislation to this end. In 1907 its powers over water companies to be organized after that date were extended by requiring that applications for charters be submitted to the approval of the commission, accompanied by data concerning the stream which it proposed to use. The Bayless company was organized many years prior to the act.

But another act passed in 1907 shows how nearly the jurisdiction of the Water Supply Commission approached the dam at Austin. This act requires that no dam shall be built on a public or navigable stream or a stream previously declared to be a "public highway" without the approval by the commission of the plans and specifications. These "highway" streams, many of them used for logging purposes, were so designated by act of legislature. The records show that Freeman's Run was on March 1, 1867, declared to be a public highway up to the farm of E. O. Austin. This is the site of the present town of Austin—below the dam.

If it had actually been sought to gerry-

mander the Austin dam out of state supervision it could not have been done more neatly. Had the dam been located a mile and a half farther downstream its construction would have been subject to the approval of the water supply commission. Or, had it been built in its actual position by a company organized later than 1907 for the purpose of doing just what the dam accomplished, it would in some measure have come under the jurisdiction of the commission. The powers of the state hemmed it in, from the angles both of time and of geographical location, and chance dictated that it should fall within the little gap where these powers did not interlock.

As the department of state government whose province comes nearest to dam construction, the Water Supply Commission, after a preliminary inspection by its engineer, Farley Gannett, has announced that it will conduct a further careful examination and that it "will recommend to the governor and legislature the enactment of such legislation as will preclude the probability of such occurrences," including in its scope "dams heretofore constructed, as well as any future obstruction that may be placed in any stream." Governor Tener, immediately following his visit to Austin, declared his intention to urge inescapable state control over dams—a matter which has been urged for twenty-two years by the *Engineering News*.

Yet even with no other powers than those which now exist, the question arises in the mind of an outsider as to whether the state did all it might have done to prevent the Austin disaster. Even with mandatory powers wanting, all the force of publicity was at command. Moreover, the following statement as to the powers of the state administration to take action through the courts has been made to THE SURVEY by one of the most distinguished members of the Pennsylvania bar, himself a man who has shouldered heavy executive responsibilities:

I know of no legislation giving the governor, or any state executive department, summary jurisdiction in relation to the Austin dam, and I am inclined to think that there is no such legislation; but I cannot agree with

with the alleged statement [made by an assistant attorney general] that "no state department without specific action of the Legislature giving the necessary powers could of itself have taken the initiative of investigating a condition such as existed at Austin before the recent disaster."

People approach questions of this character with preconceived opinions, and according to their opinion they either meet or fail to meet great emergencies. President Buchanan failed to comprehend the implied powers and responsibilities belonging to a chief executive and thereby failed to meet a great emergency. President Cleveland had a truer conception on this point, and in the matter of the Chicago strike met his responsibilities and rendered a most invaluable service to his country.

The governor of the state of Pennsylvania is its chief executive, charged with the duty to see that the laws are duly obeyed and to preserve the good order and safety of the people. If he knew that it was unsafe, or if he had reason to believe it was unsafe, it was his duty to take action to protect the lives and property of the people who were endangered by its condition.

A bill in equity in the name of the commonwealth, filed by the attorney general, by the direction of the governor, would have commanded immediate attention in any court in which it was filed. Even the Supreme Court, which is very loath to take primary jurisdiction, would not have refused to move when asked to do so in such a suit.

If the condition of the dam was such as rumor says it was, the company would probably not have defended a suit; but if it had, the court would have pushed the case to an immediate hearing and by its decree saved the lives of these people.

Of course, in what I have said I am simply expressing an opinion on a suppositious case. I do not for a moment mean to suggest that it was the governor's duty to have known of the condition of this dam. That may be true or not according to the facts, concerning which I am not informed; but I do say that the governor, or any one of the executive departments, had the power to have prevented the disaster if they had known of the conditions.

The newspapers, and especially the Philadelphia *North American*, had given much prominence to the partial failure of the dam in January, 1910, and the *Engineering News* article of March 17, 1910, had also uttered a

warning which carried with it all the influence of this technical authority. Representatives of several state departments had seen the Austin dam in its unsafe condition. While none can be accused of dereliction to its specified duty, there is no reason on the other hand to think that dire consequences would have followed a little over-zealousness. There never was a situation that more thoroughly and tragically justified the application of Theodore Roosevelt's doctrine that the state and its executive departments should not limit their action to what is set down in the law as their specific duty but should act, and act with energy, in furtherance of conserving the general well-being, where such action is not specifically prohibited.

In conclusion, to gather up the first strand in our review of social agencies and social responsibility, it is a governmental institution as old perhaps as the town itself, which, in the absence of other authority, represents the state in its immediate dealing with the question of responsibility—the coroner's jury.

In the action which this body—which we saw balked at its first session—takes, we may have an inkling whether public opinion in the commonwealth will today call for more results than grew out of Johnstown.

To the state of Pennsylvania and, for that matter, to every other state, in which waters are impounded, we look for such action as will insure safety—at least from the floods which man himself makes possible. To the

engineering profession we look for leadership in such a movement. But beyond is the responsibility for aggressive citizenship of that wider circle which includes you and me—members of that public which forgot.

A SEA-GOING HOSPITAL FOR DEEP-SEA FISHERMAN

THOMAS W. SALMON, M. D.

UNITED STATES MARINE HOSPITAL SERVICE

Every August a little company of sad-faced men and women and curious summer-boarders gathers in Gloucester to take part in a ceremony such as can be witnessed nowhere else in the United States. Only in the fishing villages of St. Pierre or northern France or Newfoundland do people come together for the same purpose, for it is the annual memorial service for the deep-sea fishermen who have perished at sea during the year. Last year forty-seven names were read, fewer, it was said, than in previous years, and after children had strewed flowers upon the receding tide twelve young widows went home with the dread which dwells always in the hearts of wives of fishermen come to full realization.

The year before there were sixty-two names, and during the last ten years the names of more than six hundred Gloucester fishermen have been read at these services. Not more than six thousand men go "out from Gloucester" to the deep-sea fisheries, and so the loss was one in ten. In time of war such a loss would fill the land with mourning; but in Gloucester it is simply counted the cost of a peaceful industry which, if we are to have sea-fish to eat, must be carried on while men have the hardihood to accept the odds.

These men lost their lives in various ways. Some went astray in their dories and fought the final battle with their ancient foe at oars' length until cold, starvation, or exhaustion decided it. Some were swept from the decks of their schooners in winter gales. Some met death with all their shipmates as

their vessels were cut down by the transatlantic liners which race across the banks.

This is the toll which the deep sea takes from those who gather her harvest. It is not all, however; for other brave men were lost whose names were not read at the services by Blynman bridge, and for whom no flowers were strewn upon the water. These fishermen died in bed in marine hospitals, attended by nurses, and provided with many comforts; yet they lost their lives through the dangerous nature of their calling just as certainly as their comrades in the dories which went astray or in the schooners which foundered on the banks. Some of them had survived the hardships of terrible days and nights adrift in dories only to sustain injury which made the end just as certain, although a little more remote. Many of them died from illnesses which the resources of modern medicine, if they can be applied in time, are quite sufficient to cure. Besides those who die, many fishermen are badly maimed through infected wounds which could be treated so successfully, were they received ashore, that only the slightest permanent defects would follow them. Fractures which have to be neglected for days and even weeks until port is reached have a very different outcome from those which are promptly cared for; and when a giant sea boards a little schooner and roars down her length, a broken bone or two is very likely to be included in the wreckage.

The lists which are read at Gloucester tell of a loss of life which is inevitable.

Map by Shelby M. Harrison.

WHERE THE UNITED STATES STANDS FOR NEGLECT.

Relative areas of the American deep-sea fishing grounds—where medical aid can be had today only from one hospital ship, that not an American boat but a Frenchman, and then only during the summer—and the North Sea where there are three hospital and four dispensary ships.

It may be, perhaps, that some means will be devised in the future to make deep-sea fishing in small boats a little less dangerous, but the perils of the stray dory, the winter gale, and the liner which races through fog are to the deep-sea fisherman what fire-damp is to the miner, and they make deep-sea fishing the most dangerous of all callings. It is the belief of those who have the welfare of the fisherman at heart, however, that the list of deaths and the much longer one of men disabled, which is never read at memorial services and is, indeed, known to very few, are far longer than they need be. Although the deep-sea fisherman cannot come to the hospital in time for more than a small part of the relief the hospital can afford him, there is a way of sending the hospital to the sick or injured fisherman.

In other countries where deep-sea fishing is an important industry the need for providing medical and surgical aid at sea has been recognized so long that the agencies for relief are well established institutions. Whether it is because life is held more cheaply here or simply because the need has not been made known, it is a rather surprising fact that no steps have yet been taken to do for the American fishermen what is done in England by the Royal National Mission to the Deep-Sea Fishermen, in French possessions by the *Société des Oeuvres de Mer*, and in Newfoundland and Labrador by Dr. Grenfell.

In the North Sea, where the Royal National Mission has provided medical relief for fishermen, fish are usually transferred to steam "carriers" which follow the fleets, making it possible to send them to the market fresh. "Boarding fish," as taking them to the carriers is called, is exceedingly dangerous work, and in the old days it used to result in a very heavy and needless loss of life. The Royal National Mission brought about the adoption of regulation for "boarding fish," and in this way many lives have been saved. The mis-

hospitals; but this was often inefficient, particularly, of course, in the worst cases.

Sir Frederick Treves, the great English surgeon, happened to be a director in the Royal National Mission to the Deep-Sea Fishermen, and he visited the fishing fleets to see if a hospital ship might be used to advantage. The result of his visit was that Dr. Wilfred Grenfell, then a young London surgeon, went out on one of the mission ships. Through Dr. Grenfell's instant appreciation of the needs and through the

THE STRATHCONA.

Dr. Grenfell's hospital steamer, which has lately been replaced by the auxiliary schooner *George B. Cluett*, the gift of George B. Cluett of Troy, New York.

sion ships which the society has long maintained have driven the "copers" or floating grog-shops from the seas, and in many other ways they have improved the lot of British fishermen; but the fishermen will bear witness that no benefit which this society has provided can compare with the hospital ships. Before the establishment of the medical mission, rough medical and surgical assistance was rendered by the skippers of mission ships, who had been given some first-aid instruction in London

great influence of Sir Frederick Treves, the first hospital ship, the *Queen Victoria*, was secured, and the days of untreated fractures and needless deaths from acute disease were over. At the present time there are three hospital ships and four dispensary ships giving medical and surgical relief on the stormy North Sea. Last year more than twelve thousand men received treatment, and many of those who were dangerously ill were carried to hospitals ashore in comfort and safety. Instead

of a two-hundred-mile journey, every mile bringing new tortures for badly injured men, treatment is commenced at once, and fishermen who in the old days would have been reduced to the workhouse, live to walk the deck again.

Not content with accomplishing what he had set out to do in the North Sea, in 1892 Dr. Grenfell set sail for Newfoundland in a ninety-ton schooner to reproduce, under far more distressing conditions, some of the relief work which had been established by the medical mission at home. His work

the evil Newfoundland and Labrador coasts. Some have been worn out in the service, for he drives them in fair weather and foul alike, but his skill as a navigator has kept them off the sunken reefs and clear of the far more dangerous ice. Within the last few weeks a fine new auxiliary schooner has been presented to Dr. Grenfell by an American friend, and the auxiliary yawls *Yale* and *Andrew J. McCosh*, presented by American college students, show that Dr. Grenfell's work has found appreciation in this country.

THE ALPHA.

A mission hospital vessel of 275 tons, engaged in services amongst the fishing fleets of the North Sea.

among the fishermen of Newfoundland and the poor "liveyères" of Labrador, to whom he has been surgeon, master-mariner, minister, and magistrate, is pretty well-known in this country. Between the forty-foot steam launch in which he made the first trip up the Labrador coast and the hospital ship *Lord Strathcona* there have been many vessels, large and small, and they have carried the blue flag of the Royal National Mission into every harbor on

Deep-sea fishing on this side of the Atlantic is done under conditions widely different from those in the North Sea and in some respects with far greater danger to life. While in England most of the fish are brought fresh to market, a considerable number of Gloucester and Boston fishermen salt their catch. The largest fresh fish fleet is found on "The Georges" and neighboring banks, although lately fresh fish have been brought from the western banks. The

"Georges" fleet is largest in winter. In summer it is depleted by the "seiners" who cruise from Cape Canso to Hatteras for mackerel, the "halibuters" and the "haddockers" who go as far to the eastward as the coast of Greenland, and by a number of smaller vessels which engage in sword-fishing. Many vessels which have been "laid up" at Gloucester or have been used on "The Georges" during the winter are fitted out with large amounts of provisions and salt in the spring and then depart for the Grand Banks, a thousand miles away, for cod. The life of these cod-fishermen on the Grand Banks is the theme of Kipling's Captains Courageous and of many of James B. Connolly's best stories.

Just as all the countries which border on the North Sea take their food out of that international fish-pond, so in summer the deep-sea fisherman of many nations gather on the Grand Banks. There are graceful Gloucester schooners, with lines drawn by naval architects who have designed cup defenders; Nova Scotians with the free-board forward of vessels twice their size but running down aft to lines in keeping with their actual size; a few schooners with crews of swarthy Bravas from the Cape Verde Islands, 2,500 miles away; brigs, barks, and barkentines which have crossed the Atlantic from France; and vessels of all sizes and many rigs from Newfoundland and the French islands of Saint Pierre-Micquelon. They all gather to share in the unfailing harvest of the sea. One can regard with equanimity the price of meat when he sees tons and tons of cod taken from the cold depths, to find their way ultimately to the tables of those of slender means in this country, France, Italy, Brazil, and even more distant lands. If the Great Bank of Newfoundland were to rise out of the sea some day and bear fine crops of wheat or corn it could support only a small part of the multitude which it now feeds as it lies submerged in several hundred feet of water.

Every year, about the middle of May, the French hospital ship *St. François d'Assise*, an auxiliary vessel of about

500 tons, appears on the Grand Banks. In March she leaves Havre, goes first to Iceland, and thence to Saint Pierre off the coast of Newfoundland. With Saint Pierre as a base she cruises all summer to the neighboring banks, giving medical and surgical aid to all fishermen in need of it, without regard to the flag which flies over them. American fishermen share in this relief to a very great extent, for on some of the banks visited by the *St. François d'Assise* they outnumber the French. Last summer 627 fishing vessels were spoken by this hospital ship, and 251 fishermen were given medical or surgical aid. A flag halfmasted is the signal, and either a medical officer leaves the hospital ship and makes his professional visit on the high seas, or the patient is brought by his comrades to the hospital ship. Although the setting of sea and sky and ships is very different from the benches and little consulting rooms of the city dispensary, there is the same problem of the relief of human suffering, and there are the same medical resources of which the doctor avails himself in practice ashore. In a single day last summer, on Banquereau, thirty-three fishing vessels were hailed by the *St. François d'Assise*. In September the hospital ship goes back to France carrying with her those fishermen who have not already recovered and been returned to their vessels.

The American fisherman's only chance to obtain medical aid on Banquereau, Saint Pierre Bank, and the Grand Banks is when this hospital ship, maintained by charity and by a small grant from the French government, makes her summer visits to the fishing grounds. At other times on these banks and at all times on the banks which lie nearer home no medical aid whatever is available in time of need. The injured man must grit his teeth, and bear it, with the chance of being permanently crippled increasing every minute, and the man stricken with sudden illness must console himself with the reflection that perhaps he has one of those diseases which doctors cannot cure anyway.

There is another side of less importance than this, but which has a bearing,

THE ST. FRANCOIS D'ASSISE.

The hospital ship which crosses the Atlantic every summer to care for the men on the Grand Banks near the French Islands Saint Pierre-Micquelon. Many American fishermen have to depend upon this ship for medical aid.

too, upon the need for a hospital ship. After the owner's share has been deducted and all expenses have been met, fishermen share alike in the proceeds of each trip. It happens very often that when a week or more has been spent in securing bait, a good "berth" secured, and everything is in readiness for the real work of catching fish to begin, a man will suddenly need medical care. He usually makes light of his troubles, for it is the rarest thing for the sick or injured fishermen to be the first to suggest making for port; but soon it becomes apparent that something must be done. The schooner is headed for a Nova Scotian port or for home, the bait is thrown overboard, the good "berth" is lost, and eighteen men lose the proceeds of a trip. They do it cheerfully enough but to the married man who comes home empty-handed it means that the bill at the grocer's must go a little longer and the children wait another month for shoes.

In looking about for a remedy for these things—and surely no one will deny that the time is ripe for something to be done—the most significant fact discovered is that the deep-sea fisherman is already a beneficiary of the United States government. The United

States Marine Hospital Service was established in 1798 to care for sick and disabled American merchant seamen, and for a number of years this relief has been extended to deep-sea fishermen. In the wards of several of the United States marine hospitals, but particularly in the hospital at Boston, can be seen the results of the failure to obtain treatment in time. Many unpromising cases from the North Atlantic fishing banks are sent out again "fit for duty at sea," and much human wreckage which is tardily brought for repair is made serviceable again; but too often this is not the outcome. Dr. L. L. Williams, the surgeon in command of the United States marine hospital at Boston, has presented to the surgeon-general a plan to extend the work of the marine hospital service so as to give relief to the fisherman when it will do him the most good.

It is proposed to build a schooner of the best type of the modern fisherman, provide her with ample auxiliary power, fit her with a complete little hospital amidships and with all the equipment necessary for giving medical and surgical aid at sea, and to send her out, in charge of a commissioned officer of the service, to patrol a watery beat which

will bring her into communication at frequent intervals with the deep-sea fishermen of New England—from "The Georges" to Banquereau in winter, and to the Grand Banks in summer. Manned by a skipper and crew who have been fishermen themselves and who know the banks as the landsman knows his own back yard, it would be possible to cruise to such advantage that 90 per cent of the vessels in this wide area could be spoken in clear weather.

The hospital schooner would be at sea by far the greater part of the time, summer and winter, returning only for supplies and to bring to the hospital men who could not be cared for at sea with the best results. The officers and crew would share many of the hardships and some of the dangers of the deep-sea fishermen, but it would be a service which many would consider a high privilege to perform—to carry the resources of medicine and surgery and the solace of skilled nursing to the gale-swept North Atlantic where several thousand American fishermen, in the pursuit of their calling, are taking the risks and sustaining the casualties of actual war. To the average landsman, a bunk in the hospital of a small schooner, tossed on the bosom of a very unsettled piece of ocean, may not look attractive; but to the sick or injured fisherman, in pain which his sympathetic comrades are powerless to relieve, the coming of such a schooner would mean relief and in not a few cases life itself.

It is, of course, for Congress to say

whether this plan can be carried out or not. The conservation of our national resources is one of the topics of the hour and Congress can be called upon to conserve no resource of more value than human life. Inevitably, the calling of the deep-sea fisherman demands a greedy share of life and health from those who follow it. It has been shown that in other countries that part of the loss which is due to the lack of medical and surgical care can be very greatly reduced. If it is possible, for an initial expenditure of \$25,000 and for an annual outlay of from \$10,000 to \$12,000 a year, to keep a thoroughly efficient hospital schooner on the American banks the year around, it is difficult to think of an adequate reason for deferring such relief much longer.

Ten years ago few people outside of New England knew anything at all about Gloucester fishermen; but the stirring pictures of their life which

James B. Connolly has given us have made the dangers and the hardships which they face so cheerfully familiar to many who have never seen salt water themselves. In time of war the deep-sea fishermen have served their country in the navy as few other groups of men could do. In times of peace every winter adds to the long list of daring rescues at sea which these fishermen have to their credit. There is an opportunity, in the providing of a hospital ship, to show in what esteem the rest of us hold the lives of these brave men who hold them so lightly themselves.

THE TARTAR.

A typical Gloucester fisherman of the present type which combines seaworthiness and beauty. Vessels of this type and size rounded "the Horn" in the days of the Klondike rush and their crews would think nothing of crossing the Atlantic in winter.

PLAY AS MEDICINE

JOSEPH LEE

PRESIDENT PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA

It seems to me that the laws of health are the most interesting laws there are. The process by which food and drink and air become man is the most interesting process in nature—a miracle in comparison with which everything else seems commonplace.

Imperious Caesar, dead and turn'd to clay,
Might stop a hole to keep the wind away.

But it seems to me infinitely more remarkable that clay, through an intermediate process of vegetation, can become imperious Caesar and take part in shaping the destinies of the world. Air, water, carbon, enter the human body and in a few hours or seconds become character. What just now was a piece of doughnut, morally innocent and unbiased, appears as love or hate or aspiration, partaking not only of human nature but of the form and accent of a particular personality, down to a trick of thought inherited from some remote ancestor. Or if we say the body does not actually contain character, but is only the instrument of its release, the phenomenon is hardly less remarkable. I am no physiologist, and am ignorant as to where the initiation takes place, at what stage it is that the new substance is met and welcomed, gets its credentials and its sailing papers, and is made a partaker of the mystery. The ancient tradition that the blood is the life, the blood bond the basis of vital relationship,

seems to have a physiological foundation. The blood has a great part assigned to it in the process by which matter becomes charged with soul. Each drop, when formed, apparently sets forth upon its mission possessed of much at least of the law and purpose of the individual. It knows, or learns as it goes along, the form of the body as a whole, judging with accuracy how much of repair is due to one tissue, how much to another—how much shall be accorded to the arms and legs, how much to the other members—and assigns to each its proper share. And the new tissues instantly understand the secret of the organism and their own part in it. Those constituting the body at a given time are, for their tour of duty, made custodian of the will and character of the individual, entrusted with the tradition, to carry it forward and hand it on to others in their turn.

The body is like an army in active service to which thousands of new recruits are every moment reporting for duty on the field, and in which each recruit, as he is assigned his place, knows by instant intuition all that the veterans knew of the structure of the whole and his own part in it.

The body in short is not a collection of material but a process through which material passes every moment. It is like a cloud on a mountain. The cloud hangs there stationary, maintaining nearly the same shape. But if you climb up, you will find that the wind is blowing through it, sending every particle of mist of which it is composed singing along at the rate of perhaps thirty miles an hour. What gives the cloud its existence and its shape is not a certain body of material but a law imposed on material that passes through. Man is not a mass of matter in a certain state, but a vortex, a flame, controlling matter that comes within its reach.

What can be done to make the flame burn more brightly? Partly, of course, the question is one of fuel; and one can learn every morning in the newspapers how by using special material, or even a special preparation of familiar kinds, one's vital energy and moral well-being can be enhanced. But fuel is not the only consideration. A breakfast-food philosophy is incomplete. Without food or air, it is true, the man will die. But he will die in any case unless he is in condition to impose himself on food and air and imbue them with his purposes. Insistent heralds of the obvious love to reiterate such startling truths as that Napoleon could not conquer Europe without rations. But how long it would have taken his rations to conquer Europe without Napoleon? How many valiant potatoes could have done the trick?

On what, then, depends the ability to perform this miracle of subduing outer elements to the law of life? What is the way to health? Here for each of us there is an ideal body to be lived up into; a flower, which the seed was dreaming of, not yet fulfilled. How can you go to work to realize the dream?

The first shock to notions derived

from dealing with inorganic matter is that the body grows not so much by taking in as by putting forth, that the way to accumulate strength is not by conservation but by using what you have. We are always teaching unfortunate children in our schools that if you take away two from ten you will have eight left. Whereas in all the important affairs of life when you take two from ten you are likely to get about fifteen. If you take away eight, and keep doing it, you may land up with two or three thousand, more or less.

There are people that think you can get rested by lying down. Even doctors sometimes tell you to do nothing. This might be very good advice if it were not for two things. The first is the difficulty of knowing how to go about it. What is the shape of nothing? What color is it? Where does it begin, how do you get hold of it, and exactly what is the process of its performance? The second difficulty is that the nearer you approach to doing nothing, the further you are from getting any good from it—that is to say, regarded as a complete régime. Of course there must be rest, sleep, and relaxation. But these do not build up. These are the gap between the waves and cease to be there when the waves cease. The prescription to do nothing is like the Irishman's account of how to make a gun—"Take a hole and pour iron around it." Until you pour your iron there is no hole.

So the first thing we learn is that the way of health is action. You have got to do something, to use the little strength you have, expend the income that is given you, in order to accumulate power or get well.

So we prescribe exercise, gymnastics, using the muscles, moving the arms and legs. And then we find that the exercise does no good, that going through a set of motions merely makes you tired and after a time bores you almost to extinction—in fact, it becomes a question whether life is worth living at such a cost, even if it could be so lived.

Then as you experiment you find that some motions are less boring than some others. There are combinations of move-

ment that seem to carry a certain satisfaction with them. You can jump with a chastened joy even when you are not jumping over anything. A muscle will do more, and take more interest in doing it, when it is working as a subordinate in some larger combination—particularly when the whole body is engaged.

But even making general, co-ordinated motions is still a somewhat dry pursuit. You cannot live by gesticulation even of the most satisfying sort. Pretty soon you find there is a mental element in healthful exercise. You are told that you must "enjoy yourself," "have a good time." And so you go yachting, take vacations, travel in Europe, frequent pleasure resorts. We have all of us seen the results of such attempts. Nothing in the long run seems to produce a deeper melancholy. The pursuit of pleasure is proverbially one in which the pursuer falls constantly behind.

Some people, however, have hit upon a device by which this sort of existence can be much improved. Young men, for instance, will go off into the woods with a pack and a canoe and an insufficient supply of food, get themselves lost, and then see whether they can get out again alive. In this way many successful experiments have been performed. As soon as the man is no longer seeking pleasure but trying with all his faculties to get out of the woods before he starves, he finds that there really begins to be a little fun in it.

There is evidently something in having to do the thing not for the pleasure there is in it but because for some reason or another it must be done. Subordination to a purpose you will find to be a standing requirement in the activity that gives life and health. The pursuit will not enter and build you up, will not lend its strength to you, unless you first lend your strength to it. It is not what you try to get out of a thing but what you put into it that is added to you. But it is not every kind of subordination that will make you well. Slaves are not particularly healthy, nor any people who are forced to drudge under exacting taskmasters.

Usually the best form of subordination is in conforming to the conditions of

some kind of service. Those who have had most experience, doctors as well as charity workers, agree that the thing that conduces most to health is work—work that is recognized and respected, and through which a person takes his part in the world and does his share.

Often—usually perhaps—such work is paid. But as charity workers know, being paid for it is not a necessary feature of the job that cures. A woman taking care of her family is made well by it. A child who does his lessons well in school is getting the same kind of benefit. Many child-helpers have told me that the very best thing for a boy or girl is having some definite duty to do at home which is recognized and respected. In old days the making good of the young citizen took a military form. The Roman took the *toga virilis*, the young Athenian became a "man" when he reached proficiency in the arts of war.

What is it that gives to work this healing property? It is the consciousness of making good. What happens to you when you get hold of a piece of useful work is the coming into your life of the sense of holding up your end, of being one of the team, a member in full standing, able to say: "We, the citizens of Boston, who carry on and constitute the city, think so and so."

In short, the healing power of work is in its gratification of the great play-instinct to belong—the instinct that makes the city and the state and is seen in boys' gangs and in the team. This team-instinct is the source of the necessity of making good and of the life that comes from doing so. The law of the team implies fulfillment of his part by every member, just as the law of the body makes this requirement of the lungs and the muscles and the rest. Are you the sort of stone that we can use or must you be rejected of the builders? We live according as we feel the requirement of society fulfilled in us, as the boy's life and satisfaction is in holding down third base. The initiations of college societies stand for a constant characteristic of every social whole. Birds will kill their lame comrade because their team sense will not allow them to aban-

don him, and his disability is a disability to the flock. As there is nothing that will kill faster than the consciousness of being a lame duck, a useless drag on the working members of society, so there is nothing that gives life like the sense of competency.

There is one important and very practical thing we can all do to heal the sick, through the action of this team-instinct to make good, which has so far been little recognized. Already we are doing much to get people into useful work. Industrial education, employment bureaus, associated charities, doctors, all are working to this end. The other thing we can all co-operate to do is to enlarge our conception of what constitutes useful work so as to include the service that the sick can render. Dr. James J. Putnam has written well and with authority upon this subject. The thing above all others that makes invalids, and prevents those who have once fallen behind in the race from getting well, is the fact that once put out of the running, once below the standard which enables a person to take his part in the industrial world, no other standard is provided. The invalid has no recognized duty to perform. There is nothing definite required of him, and no recognition is given to what he does.

Society like the individual has an invisible body toward which it tends. As any person so places himself as to fill out that form, he is received into it; he becomes a true member. The life of the whole passes through him and sustains him as the law of the cathedral thrills down through each detail, bursts out in the gargoyle here, restrains the pinnacle there, vibrates upward in the spire, and holds every stone in place. This invisible social body varies in its form. It exists in the minds of the people, and changes with their thought. It is the places that the public will, the people's conception, calls for, that can be filled, and in filling which a man partakes of the social life. There is a spiritual as well as a material demand and supply. Athens produced philosophers and artists because every citizen's conception of the body politic, because the real Athens of which the Parthenon and the Long Walls are but the material reflection included philoso-

phy and art. So Sparta produces soldiers, Rome administrators, Yale football-players. These fill out the unseen body, the invisible corporation that the members have projected in their hearts.

We must so extend our notions of what constitutes society that even these last, the invalids, are members of the team with a part assigned to them. We must learn to see so clearly that society's supreme duty is the soul's health of each that the neglect to attribute an honorable function, implying a moral demand, to any single member shall be abhorrent to us. We must in general feel that the invalid must and shall have his part, and in particular there is a task ahead of us in working out definitely for different classes of invalids and different individuals precisely what practical duties and responsibilities they can fulfill.

We must somehow say to the man that is down: "You are not left out; you as well as the rest have to hold up your end. Perhaps you are the one with the hardest task assigned. You are holding the line at its weakest point. You cannot contribute to material prosperity, but you can uphold the dignity of human nature where it is most imperiled."

And the part assigned to the invalid is indeed an important part. The regiment could never make a charge—there could never be a regiment at all—if those stricken down as it advances were not a part of it. It is because, whole or wounded, sick or well, alive or dead, they are a part of it, partakers of its acts, still advancing with it in their hearts, triumphing in its victory, that there can be such a thing as a regiment, an army, or a state. It is Dr. Putnam who has quoted in this connection Clough's verses:

If hopes were dupes, fears may be liars;
It may be, in yon smoke concealed,
Your comrades chase e'en now the fliers,
And, but for you, possess the field.

For while the tired waves, vainly breaking,
Seem here no painful inch to gain,
Far back, through creeks and inlets making,
Comes silent, flooding in, the main.

What real opportunities exist to be assigned in a given society depends on the opinion of its members as to the functions of that society. A man can be fully a member of a social body only if the part

which he can play is recognized. Heroic souls, it is true, can project their own society, can constitute through their own genius an ideal world and be sustained by it. But for the average sick soul, such a feat is beyond its strength. We shall have inspired invalids, and genius in homely forms, in proportion as the commonwealth we each carry in our hearts shall call for them. The creation of human personality in all its manifestations is an act of faith to which we all contribute or from which we may detract.

The vital potency of the belonging instinct is seen in many ways. It is said, for instance, that politicians never die—so potent to sustain is their function as official representatives of the community's team sense. Gladstone came very near to verifying that theory. When Balfour became a member of the House of Commons a long row of medicine bottles vanished from his shelf and have not reappeared. Methuselah I think was some sort of patriarch or political functionary.

In America the instinct is especially exuberant. Everyone you meet is either a Mason, an Odd Fellow, a Knight of some kind, a son or daughter of some great event, a pillar of a sewing circle or woman's club, or a member of the Grange, to which everyone belongs, including father. In the old days in Boston they used to have inoculation parties when young people would go down to an island in the harbor and be inoculated with the small-pox. So now we have, I believe, tuberculosis clubs; and I suppose that any health resort is more or less of a conspiracy among a lot of invalids to set up a standard of achievement attainable to themselves and lower than the impossible, and therefore discouraging one which prevails in the outside world of the robustious. The old Yankee word "jiner"—one who joins—is now descriptive of the American people as a whole.

Work itself may be made greatly more life-giving even than it is when, besides being the method whereby a man makes good as a member of society as a whole, it also affords him the sense of team play in the small immediate group with which he works. The great undeveloped

resource in this and every other country is the team sense of the workers. Socialism is utterly on the wrong track in trying to eliminate from industry the element of competition, with its satisfaction of one of the great play-instincts of mankind; it is on the right track in preaching co-operation. What we want, however, is not preaching but development of the capacity for co-operation by actual exercise. We want production by co-operative societies, participation by the workmen in the conduct of our corporations, co-operation of farmers in the buying of machinery and supplies and the sale of product, concrete participation in government by the extended application of the town meeting—in short, the utilization of the great human belonging faculty in our work as well as in our play. Team play in government and industry is the great neglected game and means of health.

As the muscle derives its health from serving in a combination with the whole body, as the body owes its health to serving the purposes of the mind, so the life and health of the whole organism depend on acting as a member of a larger whole. The team law compels each member to his place as the bodily law assigns its duty to each organ. And this law of the social whole thrills down into all the members of the individual until each feels the swing of the larger orbit and responds. No drop of blood can do its best work, can go singing on its way content and happy, unless the whole body serves the mind and the whole man is a servant to the social whole. We are, for better or worse, citizens, parts of a larger organism. Every tissue in us knows it. Our physical life depends upon our loyalty. It is true such service may bring death in battle or in the hospital, but it is also true that the absence of such service shuts out all hope of life.

But there are other kinds of play besides belonging. Olmsted, reporting his experience with the sanitary commission during the Civil War, said that systematic athletic recreation and the military bands had a great tendency to keep the soldiers well, while sending money home kept up their morale.

At the present time American athletic sports are driving out head-hunting in

the Philippines as being a more satisfying expression of the fighting impulse. Competition is one of the root instincts of mankind and the commonest element in all our games. To leave it out of the game of real life would be to make existence flat indeed. A race in which all receive the same prize—because though he did not win, little Johnnie ran his best—will not permanently appeal to any boy or man. To cut the connection between successful exertion and the result obtained is to lame the arithmetic of life and rob it of its normal satisfaction. No man will be either competent or satisfied when the element of competition is removed.

The simplest form of sport I have heard of, invented by a friend of mine when he had nervous prostration, was breathing. He told me it was the only thing that kept him alive. His invention did not consist of finding out that when your breath stops you die, but in learning that he could amuse himself by taking long breaths and letting them out very slowly with a hissing sound. This process, besides providing him an occupation, must have brought the additional satisfaction of being offensive to anyone in hearing. This is what the psychological students of play call "joy in being a cause"—and joy in being a nuisance is like unto it, and a very close second at that.

Some people I know always take Walter Scott for a cold. Some consider Trollope a more effective prescription; I believe, however, in reserving his *Barchester* and Parliamentary series for longer illnesses.

I remember that one time when I was sick a niece of mine gave me a Japanese straw badger, and she fixed him with one of his arms up in the air so as to present a cheerful and enterprising aspect. He was, I think, the first incarnation of Denry the Audacious, Mr. Bennet's late creation. I think in my case it was that badger that pulled me through, though the cure was shared by a nurse who kept me doing things so that I was always looking forward to the next stunt, and a Japanese bird of a cheerful and adequate personality hung in a Christmas wreath.

Just seeing pleasant things is a potent means of health. That is why girls make such good friendly visitors. Remember also Kipling's lighthouse man who went crazy because the steamers made streaks in his water. When he got on board a ship where the lines ran all kinds of ways, he began to feel better at once. When you have been in a city, where everything goes at right angles, you can feel the vital currents leap up again when you go out and see rounded tree-tops and sloping hills. The seashore is good if you do not take too much. But most people, I think, would die of it if they could not get where there was something besides gray colors and horizontal lines. Traveling would really be as good for us as it is supposed to be if you did not have to die first—that is, cut off all your other means of life in order to indulge in it.

I remember associated charity cases in which the cure was wrought by taking the patient out into the country, or even on a walk along Washington street to see the shops. Perhaps in the Washington street case there was also the element of the football tactics required in order to win through that thoroughfare.

Next to the play of the eyes there is the play of the hand. Man is a creature of the hand. He was built back from it as a river is said to grow backwards from its mouth. It was from the beginning of his career as man his point of issue, the business end of him, what the jaws are to the wolf, the claws to the cat. As he first grew up from it, he can be restored through reverting to its use. Man is primarily a manipulator. Perhaps man and manual mean for practical purposes the same. His mind and temperament are built on manipulation and are tuned to it. In a few years from now you will find in every hospital manual occupation provided, fitted to the strength and talents of the different patients.

I believe the greatest neglected source of health is in the rhythmic instinct. Its first and simplest expression, and its completest for most people, is in dancing. The mistake we usually make is to suppose that dancing is for young people only. The right age to learn to dance is

the age you happen to be; but the best age for the use of the accomplishment is from about fifty on. The instinct is as strong in the later as in the earlier part of life, and the need of using it is greater in proportion as we tend to become stiff in the joints both of our body and mind. I think the National Conference of Charities should have its folk dances as well as its baseball. You know the last part of the story of the grasshopper and the ant—which has unfortunately been omitted from all editions heretofore—is that the grasshopper took the ant's advice, danced through the winter, and came out in better shape than the ant, who had been sitting all the time over a stove. Then there is music, the dancing of the mind, which has restored many, from the age of Saul down to the present.

The most important play is play of the mind. All play is play of the soul—the active projection of the man himself as a force in the universe of action. But man is a thinking animal. It is that little head of his that has won out against claw and horn and tooth. And it is the exercise of the mind that sounds the glad sources of his strength and shows him as the gladiator he is.

The mental element is in all play, but most in art and science, and these are the best play of man and the most health-giving. We keep our children now too many hours in school and too many hours doing nothing while there. But school, rightly conducted, is as important to health as outdoor play. And in later years the mental kind of play becomes increasingly valuable. The lawyer is on the average healthier than the prize-fighter, and a man can live longer on music than he can on golf.

Back of this whole treatment, the secret of every cure through play, is the truth that the way to win life is by living it; the way for anyone to extend his personality is by acting out the personality he has. Here, next the human body, actually absorbed into it or ready to be absorbed, are cells and other molecules sitting round waiting to see what kind of sport you have to offer them. Is your invitation worth accepting, is the kind of game they see going on

there one that is worth their while to join? Can you get up such an excitement, such a rush and concourse of those who have already joined, that the on-looker is swept along in the contagion, compelled irresistibly to take a part? The game of health is like getting up a dance or a picnic. You must go in with a vim and a whoop if you want others to join with you. It is the big fire that spreads. Or it is like the method adopted by Mark Twain's Tom Sawyer when he had to whitewash the fence. You remember that he did his whitewashing with such gusto and artistic appreciation of his job, that the other boys, instead of pitying him, actually parted with their treasures—even to a dead rat with a string to swing it by that one of them was so happy as to possess—to buy a chance to do his work for him. Now Tom Sawyer is the sort of microbe you must have in your system in order to attract the rest. And it is you yourself—the actual you that deliberates and acts—who by the zest and interest of the work you assign to them can give to those already enlisted this triumphant and enticing character.

Of course I have not undertaken to cover the entire ground of play and show the use of every kind as medicine. I have merely indicated some of the chief veins that may be worked. It is not every kind of dance that is given to a human being to perform. My own list of the play-instincts which are the constituting purposes of man is: creation, rhythm, hunting, fighting, nurture, curiosity, team play. Of hunting, fighting, and nurture, not spoken of above, it may be briefly said that we all know the therapeutic value of the chasing games and of going fishing, of the games of contest and of a good scrap; while having some living thing to take care of, if it is only a dog or a geranium, is the best, and fortunately the best understood, prescription for keeping almost any woman alive and well.

This list is doubtless incomplete. I give it as a contribution to the notion we ought to be forming of the general outline of that spiritual body which it is given to man to attain. Upon the rec-

ognition that there is such a spiritual body and the successful exploration of its form the future of all social, educational, and medical work mainly depends. There are certain words written in our hearts that are the master words, that contain the possibilities of life for us. These are the ultimates, the things in which our actual life consists, to which all other phenomena of living are subordinate, all other vital processes tributary. Play is the fulfillment of these master instincts.

And it is in play, thus understood, that all our other actions

find their cause and justification. We use the expression "full play" for a thing that is acting as nature meant it to. The emotions play, the fountain plays, meaning the thing fulfills its function in the world. And so of man. Play is the word that best covers the things which he as man was wound up to do, in the doing of which he finds his soul, becomes himself. It is by being citizen, nurturer, poet, creator, scientist, by actively filling out the ideal body waiting for him, that a man can win or save his health.

JEWISH IMMIGRANTS AS TOBACCO-GROWERS AND DAIRYMEN

ALEXANDER E. CANCE

EXPERT IN CHARGE OF THE REPORT OF THE UNITED STATES IMMIGRATION COMMISSION ON RECENT IMMIGRANTS IN AGRICULTURE

Ellington, Conn., is a characteristic and picturesque old New England town, lying just east of the Connecticut valley about twenty miles northeast of Hartford, with which it has easy communication both by trolley and by steam trains over the New York, New Haven, and Hartford railroad. The western part of the town, which retains the char-

acteristic features of the valley agriculture, is a beautiful farming area, devoted principally to tobacco cultivation.

The town, of course, was settled a great many years ago, and until rather recent years the entire population was of New England stock. The old, substantially built houses, large barns and outbuildings, and fine yards with their

rows of great elms and maples give evidence of thrift and prosperity. Few rural towns in the state present a more favorable appearance than Ellington.¹

The Ellington settlement of Jews consisted in 1909 of sixteen farm families of Russian Jews operating fourteen farms in Ellington, four farms and families in Vernon township, and about the same number in East Windsor town-

ship. At present the total number of Jewish farm families is twenty-one, all of them engaged in dairying or tobacco-growing or both.

The Jews have settled in this community since 1904. They are nearly all of the better class of Russian Jews, practically all of them men who were independent proprietors at home and who were able to bring with them from \$2,000 to \$10,000 for investment in land and equipment. Taken by and large they represent the best type of Jewish farmers investigated for the immigration commission. Their investments both in land and improvements, in capital equipment and in labor expenditure per farm are greater, their returns larger, and their general farming efficiency more advanced than in most other Jewish colonies. A hasty visit to the community in the fall of 1911 found

A JEWISH FARMSTEAD.

A fine old New England farm home. The buildings and surroundings are substantial, spacious, picturesque; but few of the Jewish farmers do much to preserve the beauty of these fine homes.

the colony prospering. In two years there had been added a few new members, a number of new buildings—tobacco barns and silos—some additional stock, new machinery, and a great deal of confident assurance in the possibilities of agriculture in New England.

It has become customary to deride the agricultural pretensions of the Jew, to dismiss them with the remark that

inherently the Jews are inferior farmers, and that Jewish farm colonies cannot succeed unless assisted by some industrial or manufacturing enterprise. And on the whole it can be shown that financially assisted settlements, stimulated by philanthropists and established on raw land not immediately productive, with very little equipment and no reserve capital, have failed sooner or later—usually sooner—in instances distressingly numerous.

The successful founding of the Ellington community and its continued prosperity may be ascribed to several causes. In the first place, the Jewish Agricultural and Industrial Aid Society has greatly assisted the newcomers, not so much by actual loans as by practical advice both in the purchase of farms and in farm practice. In fact, several farms were chosen and the price and terms of purchase determined upon through the instrumentality of the society. Owing to this timely assistance few men paid too dearly for their land or made serious cultural mistakes at the outset.

¹The material facts used in this paper, which is the third in a series by Alexander E. Cance on agricultural immigrant groups in the United States, were gathered by the author while investigating immigrant communities in New England for the United States Immigration Commission. Previous articles were: *Piedmontese on the Mississippi*, September 2, 1911; *Slav Farmers on the "Abandoned Farm" Area of Connecticut*, October 7, 1911. Price for each issue, 25 cents.

THE HOME OF A RECENT PURCHASER.

The owner began as a farm laborer and with his earnings and some assistance from the Jewish Agricultural and Industrial Aid Society purchased a few acres of land, mostly wooded, with a small house and barn on it.

A TYPICAL FARMSTEAD OF THE SECOND GROUP.

When purchased these buildings were run down and dilapidated. The land has been improved but the buildings remain unrepaired. The silo has been built within two years.

A NEWLY BUILT TOBACCO BARN.

Note the peculiar open-ventilation structure. Three good horses on a riding plow is usual. The Jewish farmers operate modern machines and implements.

Then the land, although in several instances somewhat run down, is easily made productive. It is well situated both physically and with respect to markets. Comparatively large, smooth, open fields of fairly fertile soil, capable of yielding a fine quality of tobacco or excellent grass, assured the industrious settlers a cash income from the beginning.

The character of the men is perhaps more important than the quality of the soil. The first arrivals were farmers of experience and intelligence, who came from more difficult farming sections of Connecticut. One went into dairying, selling his milk at retail in Rockville; he has been very successful from the first. The other purchased an old farm of 140 acres that had been practically abandoned for years, and although tillable had become foul with weeds and wire-grass. He raised tobacco and produced milk for the Hartford market. In 1909 he was cultivating seventy acres of land and producing, in gross value, \$4,000 worth of dairy and vegetable products annually; his labor and fertilizer bill for 1908 was \$1,125. Many of the others are men of business acumen and capacity for managing labor and capital—refugees from Russia who left responsible positions in business, agriculture, or trade because of persecution. Very few homeless, penniless Jews have sought to purchase land in the vicinity. The most casual observer driving along the roads on which their farms are situated, and noting the great tobacco sheds, dairy houses, modern equipment, and herds of cows, is impressed with the fact that they have put money into agriculture as a productive investment; they are commercial farmers and look for no mere subsistence only; they expect handsome returns.

For these reasons the Russian Jew in Ellington in most respects compares very favorably with his German-Swiss or American neighbors. Since 1890 about twenty-five families of German-Swiss have purchased farms from native New Englanders and engaged in dairying and tobacco-growing. On the same road, within a distance of two

miles, some six or more Jews have bought out well-to-do owners, who sold the farms on which they had lived, raised good crops, and made improvements for a life-time. They sold to Jews and Swiss because their children had left them and the labor problem had become so acute that it was difficult to keep up the farm and make a living on it.

The improvements in the way of large houses, good barns, adequate fences, extensive yards, and fine tree-bordered roads and grounds are excellent. This group is situated on a very well kept, main-travelled road. They vary in size from eighty to 265 acres, about two-thirds tillable land in mowing, cultivated crops, and tame pasture and about one-third in woodland, wild pasture, and meadow. Most of this land possesses a fertile soil—a light clay or fine, sandy loam—in contour rolling and well drained, much of it adapted to tobacco, and held at \$60 to \$70 an acre. The Jewish farms are sandwiched in between German-Swiss and native New England farm homes of the very best type. One of the farmers on this road sold from his place produce—tobacco, rye, milk, and live stock—amounting in value to nearly \$7,000 in 1908; his expenditures for labor amounted to \$1,500. In 1910 he sold nearly \$6,000 worth of tobacco, besides milk from a herd of twenty or more cows, potatoes, and other products; his expenditures for labor and fertilizer, which he buys in carload lots, are increasing every year.

A second group of Jewish farms is located about one mile back from the first at the base of a sandy, gravelly ridge, in a neighborhood more isolated. Here eight years ago were half a dozen or more semi-abandoned farms, once well-tilled, but for several years permitted to fall into decay. On each of them a few acres out of a possible sixty or seventy were cultivated in potatoes, corn, or rye, and a few cows or hogs were kept, but there was little or no farming for profit, and the section seemed to be rapidly declining. The land is rough, the soil stony and in part composed of coarse sand. The farms were purchased cheaply, since the

soil was less fertile, the buildings in poor repair, and much of the land was growing up to brush and briars. Some purchases were made for \$15 an acre, most of them for \$25 to \$40, in tracts of 100 to 150 acres. Aside from the comparatively small acreage of woodland, nearly all the land is capable of cultivation.

In this vicinity Russian Jews picked up with avidity practically all the farms on the market; and although all the houses and barns do not give one that impression, probably greater progress in restoration and improvement has been made on some of these farms than on any in the neighborhood within the past few years.

Considering both groups of settlers, the farms of the Jews do not differ in acreage from the general average of the town, and the types of agriculture pursued are very similar to those followed by the German or the native American husbandman. The Swiss holdings average perhaps a little less per farm, but every bit of available land on a Swiss farm is in cultivation.

The two crops of universal commercial interest are tobacco and Irish potatoes. Every man whose soil is at all adapted to it raises tobacco, but there are no large growers—the maximum tobacco area per farm is twenty to twenty-five acres, the average six to ten; the yield ranges from 1400 to 2000 pounds per acre. It does not appear that the Jews produce less pounds per acre or that on the whole the quality of the cured leaf is inferior to the average in the vicinity.

Tobacco requires careful cultivation and close attention from planting to shipment. Perhaps no crop is more susceptible to meteorological changes or subject to attack by more diseases or pests. Excessive heat, frost, drought, over-abundance of moisture, wind, hail, a myriad of insects and diseases, and, finally, the fickle fancy of the consumer,—all seem in league against the grower. Unfamiliar with tobacco cultivation, the Jews have met these difficulties and obstacles with varying degrees of success. They employ the most modern machinery and equipment, invest in

A NEW ENGLAND SCHOOL-HOUSE.

A district school in the Jewish and German Swiss neighborhood. The Jews do not find educational facilities to their satisfaction in the rural districts.

ample tobacco barns of the usual type—hundreds of feet of barns have been built since 1904—apply high-grade fertilizers, and make large expenditures of labor. In short, they seem to have adopted the best methods in vogue in the vicinity, but to have introduced no innovations.

Potatoes as a money crop are not a main reliance. The soil is favorable, but in general tobacco is more profitable; and although potatoes are harvested after the tobacco is housed, during the period of cultivation tobacco and potatoes are really competing crops.

Most of the other crops—corn, oats, hay, stover, and ensilage—are accompaniments of the dairy industry into which both Jews and Swiss have entered rather extensively. Their herds range from five to twenty-five cows, some of them good milkers, but few well-bred; most of the herds exhibit traces of several different breeds of dairy and beef cattle. The product sold is milk, which is disposed of, either at wholesale or retail, in Rockville or Hartford, or as butter-fat to one of the two local creameries. It is questionable whether the dairy industry is profitable even under the very favorable marketing conditions which exist; but the dairy income runs from \$200 to \$1,500 per farm, annually, in addition to the large quantity of milk, cream, and butter consumed by the family.

A HERD ON ONE OF THE FARMS.

Dairying is an important sub-industry, but the cows are usually "scrubs" or grades. A herd may be made up of several different breeds of cattle. The landscape shows the gently rolling topography of the district.

The investment in horses, tools, implements, vehicles, and farm machines is larger and the equipment more modern and complete than on many American farms. It has been difficult and increasingly expensive to obtain sufficient farm laborers; hence, where the improved area is large enough, the substitution of machinery for manual labor has been going on for some time. But at best a great deal of human labor is required in dairying and tobacco-growing—a situation which the Jews have been able to meet by employing fellow-countrymen who have recently arrived. One or two of these incipient farm laborers have later purchased small, unimproved farms in the neighborhood.

The average Jewish farmer does not pay as much attention to repairs on fences or buildings, to the care and housing of tools, to painting his buildings, trimming his trees, gathering up trash and litter, in fine, to keeping up appearances and improvements, as his American or German-Swiss neighbor. Very often one can pick out the farmstead of a Jew by the disorder, unkempt appearance, and general dilapidation of the premises. This is partly due to a lack of aesthetic pride in his surround-

ings, in part to the rather recent occupation of the farms by the Jews. Prosperity assured, it is likely that the examples of careful neighbors will lead to improvement in this regard later on. It is unfortunate that this neglect of his premises detracts much from the thrifty aspect and market value of several Jewish farms and gives one an unfavorable impression, not always deserved, of Hebrew agriculture. In the midst of general prosperity and neighbors who take pride in the appearance of their farm houses the Jewish farmstead is at times unfavorably conspicuous. One who has visited many foreign communities, however, is impressed with the superiority of the Ellington farms in this regard.

Marketing conditions are unusually favorable; Rockville, two miles away, furnishes an adequate local market for perishable products; transportation facilities are excellent; shipping stations are located within two miles of nearly every farmer and the wagon roads are usually in good condition. The tobacco market has for years been unsatisfactory, but it is not shown that the Gentile grower suffers less than the Jew.

One of the very few distinctively

Jewish organizations, formed for economic assistance and protection, is a co-operative society known as the Connecticut Jewish Farmers' Association. Its existence grew out of the need for some organization to bring the farmers into touch with each other, and out of the attitude of some of the Jewish farmers toward the grange. Apparently the local grange, though willing to admit certain Jews to membership, was unwilling to admit all the Yiddish farmers, who wanted to join as a body, if at all. Some of the Jews felt they were *personae non gratae* with the grangers and in 1908 formed an organization of their own. Twenty-one Jewish farmers are members.

Thus far little co-operative selling has been done, but some purchases of fertilizer and spraying material have been profitably made. The greatest benefits that accrue are social. Both men and women are members; meetings are held weekly in winter and semi-monthly in summer, and do much to promote social good-fellowship and class consciousness among the members. An arbitration committee of five members, empowered to settle, out of court, disputes between members, has within it the possibility of doing much to prevent bad feeling and save costs of litigation. The members seem to think this a very important feature.

The standard of living is comparatively high in the greater number of families. They lived well at home and are living well here. Most of the men and a large part of the women understand and speak English. The younger people, whether born in the United States or abroad, have all learned to speak our language. The fact that there is no Jewish synagogue, school, or other institution (except the farmers' society), and that there is no real "colony" or segregated settlement of Jews in the strict sense, has aided greatly in breaking down racial traditions and customs and hastening Americanization.

It is characteristic that all seem eager to give their children the best education possible, and one of the most common complaints is the lack of adequate school facilities. The public schools near Ellington are as good as the aver-

age and have satisfied rural Connecticut for years. But they do not satisfy the Hebrew farmer. Some take their children into Rockville every morning; others contemplate sending their sons and daughters to the Hartford high school. The instruction in the district schools is not very satisfactory and, of course, does not extend beyond the eighth grade. Some Americans laugh at the educational pretensions of the Hebrews, but there is no prejudice manifested against the children in school, nearly every one of whom seems to give a good account of himself. There are practically no illiterates among those interviewed, and some are very well educated.

Morally they stand in good report among the members of the community. No crimes have been committed and few civil suits have arisen. In fine, most of them are honest, industrious, law-abiding people, who intend to become citizens and permanent residents of the town. They wish to become Americans, to educate their children in American ways for American positions of profit and honor. They revere the old traditions, but they desire to step out of the "foreign" class as soon as possible.

Opportunity to attain these things is afforded in Ellington in greater degree than in many places. Here are found a fertile soil, good marketing facilities, large possibilities for the educated practical farmer. There is no real segregation by race. Nearly every Jew has a neighbor on some side who is a non-Jew. There have been no intermarriages, but the religious restraints are much less strong than in many localities, and in many respects Jew and Gentile meet on the same social footing. Prejudice, once very much in evidence, is dying out and the Hebrew farmer is making himself respected. In Ellington he is a farmer, not a summer-boarder agriculturalist, nor a combined Jewish peddler, cattle trader, and "moss back." The settlement is still in its infancy, but the impression gained by even a few days' contact with these men is decidedly hopeful and favorable in almost every respect.

ONE BLIND MAN THE LESS.

Goggles encrusted with babbit metal. If the employe had not worn the goggles, he would undoubtedly have lost both eyes. As it was, he escaped with a slight burn on the face.

THE HUMAN SIDE OF LARGE OUTPUTS

STEEL AND STEEL WORKERS IN SIX AMERICAN STATES

II

ILLINOIS: BOOSTING FOR SAFETY

SAFETY PHOTOGRAPHS: COURTESY UNITED STATES STEEL CORPORATION

JOHN A. FITCH

MEMBER STAFF (1907-8) PITTSBURGH SURVEY

The first steel rail made in America was rolled at the works of the North Chicago Rolling Mill Company. Outstripped for a generation thereafter in steel output as it had been in iron, Chicago is today forging to the front as one of the greatest steel producing centers in America. On the north is the American Steel and Wire Company's mill at Waukegan; in South Chicago are the plants of several minor concerns, besides the immense works of the Illinois Steel Company; at the southwest is Joliet with plants of importance; on the south shore of Lake Michigan is Indiana Harbor, with a plant of the Inland Steel Company, an independent, and, finally, Gary itself. The supremacy in steel will not pass from Pittsburgh to Chicago tomorrow, nor the day after; but no one can blink the fact that already this section is producing an enormous tonnage. Not less than 30,000 men are

employed in the reduction of ore and in making, working, and fabricating steel.

A good many reasons have been given for the stride forward taken in the past ten years by the lower Lake Michigan steel district. One is the nearness to the Minnesota ore fields. Another is the Illinois coal mines. Neither of these seem adequate, for ore can be transported with almost equal cheapness anywhere on the Great Lakes, and there is no coal so adapted to coking as that from the Connellsville district, near Pittsburgh. The real reason would seem to be the development of the West, where new railroads are being built, cities are growing, sky-scrapers going up. There is need of a mid-western manufacturing and distributing point commensurate with the demand for steel, and the Chicago plants have grown in answer to that need, just as there is pros-

pect today of the development of Duluth as a manufacturing and distributing point still further to the north and west.

In Chicago the biggest and most important manufacturer of steel is the Illinois Steel Company. And it is not only the biggest in Chicago, but the biggest in the West. With plants at Milwaukee, Joliet, Chicago, and Gary, it employs in normal times about 25,000 men. It was the Illinois Steel Company that built the Gary steel plant, with its own men, and now that it is built, the Illinois Steel Company is operating it.¹

The South Works of the Illinois Steel Company employed 6,000 men in 1900—before it was taken over by the U. S. Steel Corporation. Today, when the plant is on full time, it employs 10,000 to 11,000. Since 1900 three blast furnaces have been added to the eight then in blast, a second open-hearth department with fourteen furnaces has been constructed, more than doubling the capacity for open-hearth steel. There have been added two blooming mills, two structural mills, and a universal plate mill.

It is a great plant, extending for two miles along the shore of the lake—one of the greatest plants in the world. But many South Chicago people think that it might have been very much larger. The town and plant at Gary would never have been built, they declare, if South Chicago had been rightfully treated.

"The big plant would have been built here instead of at Gary", a bluff old South Chicago citizen explained to me, "if it hadn't been for a damn little cuss of a public works commissioner, under a Democratic mayor we had, named Dunne. . . . This fellow was a Socialist and he thought he was bigger than the people of Chicago."

The Commissioner in question was Joseph Medill Patterson, formerly one of the editors of the *Chicago Tribune*, a successful playwright, and author of several well known books. His offense consisted in trying to enforce the law. It seems that the South

Chicago plant, being surrounded on three sides by property not owned by the company, could expand only in one direction—into the lake. So for many years slag was dumped into the lake for filling, and new land slowly made. There was no legal sanction for such appropriation of the lake bottom and when, during Mayor Dunne's administration, the company wished to start new construction, Commissioner Patterson refused a permit and started suit to recover the land already built upon beyond the old shore line. This stopped expansion for a time and the Gary plant was started afterward. But one has only to look at the Gary plant, extending two or three miles along the lake, and in from the shore for a mile, to realize how impossible it would have been to build so great an industrial establishment at South Chicago on made land.

There is no need to record again the tremendous engineering feats necessary to the creation of the Gary plant in 1906 and after. The story has been told often enough of how the tracks of a half-dozen railroads were picked up and flung a few miles to the south, of how a river was moved, how hills and trees were eliminated and a harbor was dredged fit to accommodate the great ore boats, and finally how a city was built, paved and sewered and lighted, where there had been the day before but a waste of sand dunes.

There were 6,000 men in the plant when I visited it last winter. I would not have guessed that there were a third of that number, the plant and the machinery are so big and overpowering. The enormous ore unloaders, skeleton-like, uncanny, where two men do the work that fifty used to do; the blast furnaces, among the biggest in the country, so automatic that the labor force is 25 per cent less than the average for blast furnaces; the spaciousness of the great sheds with their high roofs—all tend to give impressiveness to the plant.

To this plant has been gathered an army of men. Skilled and unskilled they have come, native and alien, Teuton, Celt, and Slav. English-speaking men and men who speak in strange tongues; men

¹The Indiana Steel Company is the company that owns the Gary plant—on paper—and the Illinois Steel Company is the lessee. But both companies occupy the same offices in Chicago and have the same officers.

THE CIVIC PROBLEM OF THE PEOPLE WHO LIVE IN SOUTH CHICAGO.
THE STEEL PLANT IS A CLOSE SECOND TO GARY : WHAT ABOUT REHABILITATING THE TOWN?
THERE ARE ATTRACTIVE SECTIONS, BUT THERE ARE ALSO SOME OF THE WORST CONGESTED DISTRICTS
IN ALL CHICAGO.

Looking East Toward the Illinois Steel Plant Over Roofs of the Immigrant Quarter.

who have fed furnaces in Pittsburgh, who have pulled levers at Lackawanna, who have riveted cars at Johnstown, pulled scrap from the shears at Pueblo, or bossed negro gangs in Birmingham. And men have come, too, from farms and hamlets of Bohemia and Hungary, Servia and Montenegro, come to a new world to new work, to machines and wonders of which they never before had dreamed—to new opportunity.

Thus a new plant and a new community has been formed, without tradition, without old scores, with no past, only a future. There was here no Irish turbulence at the blast furnaces; there were no stubborn Welch puddlers to reckon with. The stolid Slavs are taking care of the giant stacks and the puddling furnaces are no more.

Gary is probably destined to be greater in the annals of steel making than South Chicago, because the construction engineers had before them the mistakes of years in other plants. What South Chicago has found was wrong and has had to patch up, Gary has avoided through construction. The straight hauls at Gary, the iron ore starting at one end of the plant and the finished material coming out at the other, the lack of congestion, the broad gauge tracks instead of the "dinkeys", the powerful engines, the enormous cranes—all are suggestive of economy and speed.

"If", said an official of the plant, "we do not make steel more cheaply here at Gary than anywhere else in America, the building of the plant will not have been justified."

Gary's five-year story is a thrilling one. South Chicago's advance has been less exciting because, like Rome, it was not built in a day. Steel was first made at the South Works in 1882 and the growth since then has been steady and non-spectacular. Yet without the leaps and bounds in growth which have challenged the attention of the world at Gary, the South Chicago plant has developed until amazing deeds are matters of daily occurrence. From eleven blast furnaces 4500 tons of iron are tapped every twenty-four hours, more than 400 tons to each furnace. The Bessemer and

open-hearth departments together produce 240 tons of steel every hour, while the rail mill turns out every day forty miles of eighty-pound rails, enough for twenty miles of track. It is not in Pittsburgh alone that big things are done.

The growth of a great plant, the sudden springing into being of another, and the mechanical efficiency of both are very impressive. But of greater significance is the force that gives effectiveness to both plant and machine—managerial efficiency. A group of men of unusual capacity for organization and leadership are directing the development and operation of these remarkable plants, and this is more important than any machinery, however automatic and useful.

It is this leadership and the efficiency of compact organization that is the great thing about the Illinois Steel Company, for it has to its credit an achievement more important than the installing of new engines or beating the tonnage record of the world or building a city overnight. It has to its credit a record of human conservation. It has not made its plants absolutely safe. There will always be danger in making steel. But it is playing a leading part in putting a stop to that mad waste of life and limb that four years back made the steel industry a hell.

The Illinois Steel Company had had a Safety Department at its South Works for a good many years prior to 1908. For a good many years men had reported on unsafe conditions and recommended improvements. But nevertheless for many years the accident and death roll of the plant was a shocking revelation of the feebleness of human economy in plant operation. In 1906, forty-six men lost their lives in the South Chicago mill. To quote William Hard:¹

Twelve of them were killed in the neighborhood of blast furnaces. One was hurled out of life by a stick of dynamite. Three of them were electrocuted. Three of them were killed by falls from high places. Four of them were struck on their heads by falling objects. Four of them were burned to death by hot metal in the Bessemer converter department. Three of them were crushed to death.

¹Making Steel and Killing Men. *Everybody's Magazine*, November, 1907.

SAFETY BEGINS AT THE MILL.

Viaduct over railway yards at 89th street gate, South Works. The viaduct makes it unnecessary for the men to risk their lives on the congested tracks.

One was suffocated by the gas from a gas producer. One of them was thrown from an ore bridge by a high wind. One of them was hit by a red-hot rail. One of them was scorched to death by slag. And ten of them were killed by railroad cars or by railroad locomotives.

Hard published his article in November, 1907. The next spring a new policy was inaugurated by the Illinois Company. A closer organization was effected and all of the plants brought into harmony in an effective, determined campaign for safety. In 1910 fourteen men instead of forty-six lost their lives at the South Works. In this new campaign a spirit of enthusiasm, effective and unique, was set on foot. A Central Committee of Safety was formed, consisting today of the safety inspector and the assistant general superintendent from each plant, an official from the statistical department who acts as secretary, and a representative of the legal department in charge of personal injury matters. The general attorney of the company acts as chairman of the committee.

In each plant two classes of safety committees were formed, workmen's committees and permanent committees. Each of the larger plants is divided into three or four divisions and in each division three workmen are appointed to serve two months and look out for the safety of the division. They spend one day each two weeks looking for dangerous places and talking with the men in order to get suggestions as to safety. The permanent committees are made up of groups of foremen. There is a permanent committee for each department which inspects the department once each month to see that safety devices have been installed and to investigate accidents.

The scope and effectiveness of the work of this safety organization is notable. The inspections are far more searching than the factory inspection work of any of our state governments. The workmen's committees are followed up by the permanent committees and both by the chief inspector, and his work in

turn is checked by the chairman and secretary of the Central Safety Committee. Special workmen's committees are appointed now and then to inspect other plants for new ideas, and in each department skilled experts, not members of the committee, make inspections from time to time.

The central committee is working out standard safety devices and rules and no new machinery is installed unless approved by the safety experts. No blue print is allowed to leave the drafting

foremen, and men, of resistance to unsafe methods. It is a new spirit and one destined to accomplish incalculable good. By ingenious methods the spirit is fostered and made to grow. The slogan is "Boost for Safety", and everybody boosts. It is a contagious thing. One of the safety men said to me, "Why, I can't pass an obstruction on the sidewalk any more. I've got to stop and throw it off."

This new, organized, and resourceful attack upon the danger zones of produc-

OVERHEAD TRAVELLING CRANE.

All overhead cranes are provided with railed walks on both bridges the entire length of the crane. Each crane is also equipped with guards extending out from the truck wheels, the purpose being to warn a person working on a scaffold, and resting his hand on the rail of the approach of the crane.

room until it has been checked for safety. Foremen are examined from time to time on their knowledge of safety rules and a foreman who persistently fails to familiarize himself with them is discharged or transferred.

With Chairman Campbell of the Central Safety Committee of the Illinois company I went through the South Chicago and Gary plants, and I was everywhere impressed with the spirit that prevails among superintendents,

tion is not unique with the Illinois Steel Company. Similar work is done by the other subsidiary companies of the United States Steel Corporation. With the formation of a Central Safety Committee in April, 1908, made up of safety men from these different managements, a concerted movement was inaugurated which has been carried a stage further the past year in the transfer of the safety expert of the National Tube Company to headquarters, to carry on

clearing-house methods between the different offices. Apart from this general interchange, each company, however, develops its safety work along individual lines; and it is the team-play of its central committee that gives distinction to the work of the Illinois company.

Workmen are encouraged to make suggestions, and some of the most valuable ideas come from them. Safety inventions are paid for. At South Chicago when I visited the plant a man in the pattern shop had just perfected a

splash by the goggles he wore. The metal-encrusted goggles were immediately photographed and the photograph placed on the bulletin-boards as an example to the workmen.

I attended a meeting of the Central Safety Committee and in it I think I discovered the secret of the remarkable work that has been accomplished—and that is going on—that has reduced the number of fatalities in the South Chicago plant from forty-six in 1906 to fourteen in 1910. At first I thought it was because

HINGED PLATE COVERS OVER DRIVE SHAFTING AND GEARS ON ROLLER TABLE.

circular-saw guard which was the pride of the shop. Another had made an improved belt-shifter. And the thing that impressed me was that these inventions were commended as highly as if they had been designed to boost out-put instead of safety.

Bulletin-boards are scattered through the mills and every two weeks the departments that get into the "booster class"—those that have kept the accident rate down to a minimum—are posted. The boards are used in various ways to inculcate habits of caution. The day before I visited the South Chicago plant a man's eyes had been saved from a metal

the chief safety inspectors are not operating men, and have no responsibility as to output. But in the committee I found the superintendents—the operating men—as eager for safety as were the inspectors. Perhaps it is thought that spending money for safety will save money for the company in the long run. I think it will. But that was not what the safety committee talked about that morning. A man in one of the plants had had the end of a finger taken off by a piece of moving machinery that had a hole in it just the size of his finger. He had put his finger into that hole. The discussion brought out the fact that the same hole

GEAR PROTECTION ON ROLL LATHES.

GUARDED BUZZ PLANER IN PATTERN SHOP.

was to be found on similar machines in all the plants. The committee decided that these holes must be covered or filled. Another man had slipped and fallen as he walked, inside the plant, to his work. It was found that ashes had been sprinkled in slippery places, but it was ordered that this be done more carefully.

From accidents the committee turned to a consideration of recommendations on safety devices, from foreman's committees and from workmen's committees. None of these were revolutionary. They were detailed, accompanied by designs, and involved simple changes in method or the installation of minor safety devices. They were all considered, some were passed upon, and others were put over until the next meeting. It was not apparent to me that all of this deliberation would work the financial advancement of the company. There was something in that meeting that can be explained only on the ground of humanitarianism. It impressed me strongly and gave me more faith in my fellow-men.

All this spells achievement of a high order. The quiet growth of a plant thirty years old, the building of a new one, the devising of a new scheme for saving men's lives, the building of a city—it is all a story of things done, things that

only strong men can do. And such achievement inevitably brings two other factors into play, responsibility and opportunity. Of the former I shall say little, for it is self-evident. The latter is too tremendous for full discussion, but I can sketch in the barest outline some of the things that are comprehended today in the unparalleled opportunity now open to the Illinois Steel Company.

The most obvious opportunity, three years ago, was to set a new standard for safety. Now an even larger opportunity is beginning to present itself. Some of the members of the safety committee have begun to think that if humanity and business alike dictate that men's lives and limbs ought to be protected against the danger of accident, by the same token men's bodies should be protected against disease.

That phase of disease most closely akin to the accident problem is infection; and nowhere else, as in the absolute and prompt control which the hospital corps of these larger plants have over the treatment of flesh wounds, major and minor, is there such an opportunity for the reduction of infection to a minimum. This is a field in which the Carnegie Steel Company has made notable advances among its scattered plants in the

Pittsburgh district, where a larger administrative problem is of course involved. There is a hospital at South Chicago where the injured men are cared for. It is an old one and while it does effective service it does not represent the best that could be desired. But at Gary, where the Illinois company could build everything new, there is one of the finest hospitals in the United States. It is a plant such as few cities in America have supplied for themselves.

The Central Safety Committee had as a topic for discussion at a recent meeting the question of a sanitary water supply and sanitary drinking-cups. At present drinking-water is brought into the mills in ordinary wooden pails and poured into barrels. A cake of ice is kept in each barrel, and when a man wants a drink he takes the cover off and dips up the water with a tin cup. The next man uses the same tin cup, although venereal disease is known to be prevalent among certain classes in the mills. The Chicago company could well afford to follow the example of the National Tube Company, which is installing in its plants a circulatory, ammonia-cooled water

system, with fountain drinking cups. For many years the steel companies have had gas washers connected with their blast furnaces to remove dust from the gas before it enters the stoves. This sanitary drinking-water system will afford equal protection to men.

After this the safety committee might spend some very profitable meetings discussing heat. At South Chicago there are tubes delivering cool air to men in some of the hottest positions. At Gary high roofs have done much to improve ventilation. But it has not yet become possible to make steel without subjecting men to great heat. Workmen go with open pores, and clothes wet through with sweat, out from the mills into the cold winter air. Such a radical change in temperature, day after day, is extremely dangerous, and rheumatism and bronchial and pulmonary diseases are common in steel mill communities. Shower baths and a change of clothing before leaving the mill would help to prepare the men for the shock of contact with the cold air. At Gary showers were installed at the open-hearth furnaces, but the men did not use them, so

BEVEL SHEAR GUARDS.

they were taken out. South Chicago had the same experience at the open-hearth furnaces, but the showers in the Bessemer department have been and are used by the men. There may be a significance in the fact that the Bessemer men have an eight-hour day, while the open-hearth men work twelve hours. Perhaps the latter feel that so little of the day is left when the end of a turn comes that they want to get out as fast as possible and get a grip on the time that remains and is their own. Be that as it may, the National Tube Company has not been deterred from installing shower baths by the fact that the men do not use them as might be hoped. Showers have been installed in many departments in their plant at McKeesport, and are eventually to be installed in all departments in all plants. An official of that company remarked to me: "It is not our fault if the men don't use the baths, but it is our fault if the baths are not there to be used, and if they are there, the men will learn after a while to use them." The Tennessee Coal, Iron, and Railroad Company at Birmingham is also installing baths in all departments.

The report made by the Illinois Commission on Occupational Diseases last January contained a section on carbon-monoxide poisoning. The reports state that on one day, October 15, 1910, twenty-eight men were overcome by carbon-monoxide gas in one blast furnace plant. This was conceded to be an unusually large number, but the fact was ascertained that among 900 men employed in the blast furnaces studied there have been in the last four years thirteen fatal cases of gassing, and that there have been averages of sixty-five severe cases and two hundred and sixteen mild cases each year. These were the cases actually found. The report adds that the "real number occurring would be much higher, since mild cases are never recorded and are often forgotten." In addition to these occurrences at the blast furnaces, it was found that other danger points are the boiler houses, gas engines, and the open-hearth furnaces.

One immediate and direct danger was found to be connected with gassing—that of falling from a height, or into molten

metal, when overcome. The report says, on page 93, "Of twenty-two men actually gassed and immediately rescued, three showed notable burns and three showed bruises, demonstrating that they were deeply and rapidly narcotized. We cite the case of one worker who was burned almost to a crisp before being taken out, and of another who fell to his death twenty-five feet below. Many other illustrations like these could be given."

The Illinois Steel Company was commended by the commission for the care it has taken to prevent as much as possible the escape of this gas. But as yet no method has been found of preventing all escape, and so accidents occur. One case was found at South Chicago of an employe of the gas cleaning house who was overcome while sitting in a chair.

But the commission was more concerned with the steady recurrence of mild cases than with the tragic consequences of the severe ones. Men who constantly breathe a little carbon monoxide gas, who are occasionally overcome, removed to the outer air, and recover and return to work may well engage the attention of experts. Two hundred and forty such men were critically examined by the commission and some startlingly significant facts were discovered. An excess of red blood corpuscles was found in every case. The layman would be inclined to consider this a favorable condition, but the commission was not prepared to say that it is so.¹ They desired opportunity for further study. But other factors of great significance were found. The men exposed to this gas were submitted to a strength test, and two numerically equal bodies of workmen not exposed were submitted to the same test.

In every case the former were found to be *deficient in muscular power*.²

¹There is not unanimity in the medical profession on this point, but a member of the commission stated that a theory now held is that an excess of red corpuscles may indicate a pathological condition.

²The average tests ran as follows for men of ages from twenty to forty years: for those exposed, 117.13; for the two groups not exposed, 136.11 and 134.43, respectively; for men over forty the tests for the three groups were respectively 94.30, 127.25, and 113.01. In other words, a man of thirty exposed to carbon monoxide gas is no better man, and possibly not as good, as one fifty years old not so exposed.

THE BLAST FURNACE.

USED TO MEAN CONSTANT DANGER OF VIOLENT DEATH; 12 HOURS' WORK A DAY; 7 DAYS' WORK A WEEK; THE 24-HOUR TURN EVERY FORTNIGHT. NOW IT MEANS SAFETY (COMPARED WITH THE OLD CONDITIONS, THOUGH IT WILL ALWAYS BE HAZARDOUS); THE WORKING WEEK HAS BEEN CUT DOWN TO 6 DAYS; BUT THE 12-HOUR LAW REMAINS THE IRON LAW FOR FURNACE WORKERS.

Upper picture shows a thin-shelled, water-cooled blast furnace; the lower picture, bosh and cast house at base of the stack. The stairs and platforms shown are to facilitate safe inspection of the furnace and water-cooling apparatus. All furnace stoves and furnaces are connected by walks provided with hand railings. Each cast house is equipped with stairs or runways leading away from the furnace, so that in case of a break-out the men can quickly leave the danger zone. All elevated floors are railed, and the cast houses are roofed with steel plate to protect the men from material blown out of the top of the furnace. Where ladles are loaded under the floor of the cast house, the casting holes are guarded by grates.

SOLID BLOCK OF SALOONS ON THE "STRAND," NEAR THE MAIN GATE OF THE MILL,
SOUTH CHICAGO.

Whether twelve-hour men have the strength or time or imagination to go further and higher for their refreshment and recreation is a question on which there is not much room for but one answer.

The commission also found that "the majority of the men examined were below the average, mentally, but 97 per cent of them stated that they used alcoholic liquors, while 70 per cent admitted using alcohol in excessive quantities;¹ consequently it becomes very difficult to make deductions as to the exact part played by C O. Since it is a well known fact, however, that prolonged exposure to carbon monoxide may produce a profound impression on the nervous system, we may regard it as by no means improbable that a part of the sluggish mentality observed among the steel workers may be due to frequent exposure to the gas."

The investigators felt less positive about the muscular deficiency noted. It might be due to the gas, but it might also be due to the alcoholism noted above, to venereal disease, of which a surprising amount was discovered, or to unhygienic living. The investigators were medical experts, not social workers. It was their work to find out physical, not social causes. So a question at once presents itself that the commission did not dwell

upon. The men not exposed to gas upon whom strength tests were made were said to be in good hygienic condition—in a better condition, apparently, than those exposed to the gas. Why was this the case? Do blast-furnace workers indulge in more vice and more liquor than others? If so, a condition exists even more serious than gas poisoning. It may not be wholly irrelevant to mention that blast-furnace men—the two hundred and forty examined by the commission—were *men who worked twelve hours a day, seven days a week.*

If such a remark is not irrelevant, may we not direct the attention of the safety committee to hours of labor in general? Hours of labor in the mills of the Illinois Steel Company are just about the same as in other mills. At South Chicago the Bessemer department and rail mill No. 1 are operated on the three-turn system, and so the men have an eight-hour day. At Gary there are no eight-hour jobs. In both plants molders, machinists, pattern-makers, and yard laborers have a ten-hour day. All other departments work twelve hours, and these include a majority of the employees.

¹Italics are the present writer's.

There are some peculiar things and possibly a few mitigating circumstances about the hours of labor in the mills of the Illinois Steel Company. Rail mill No. 1 at South Chicago runs on the three-shift plan. Rail mill No. 2 in the same plant operates with two shifts. But rail mill No. 2 makes only light rails. The Gary rail mill, however, is operated in twelve-hour shifts and it makes heavy rails just as rail mill No. 1 at South Chicago does. This peculiarity is also to be noted in other plants of the Steel Corporation. The Edgar Thomson plant at Braddock, Penn., works its men who make rails twelve hours a day, while the blooming mill rollers have eight hours.

The plate and structural mills at South Chicago are also run on the two-shift plan, but here enters a mitigating circumstance. There are "spell hands" provided in these mills, and all of the men holding the more arduous positions are, the management states, periodically relieved. In fact, there are practically two men for each position, each working thirty minutes and resting thirty minutes alternately through the day. Thus each man actually works only six hours a day, although he is on duty for twelve hours. There are a good many reasons why it is socially bad for a man to remain on duty twelve hours a day, whether working all the time or not. He may not have his nose to the grindstone every minute, but his free time is not leisure, nor spent amid surroundings where he can find engagement and refreshment in it. He is no more off duty than a football player waiting for the referee's whistle before resuming play. The same energy and splendid co-operation that have reduced serious accidents 50 per cent could, I am sure, find a way to avoid keeping men on the job twelve hours to do six hours' work.

With respect to Sunday work there is already an intelligent and progressive policy afoot. The Welfare Committee of the American Iron and Steel Institute has recommended a plan for giving one day of rest in seven to all employes in the continuous seven-day departments. I have recently received word that this plan has recently been adopted by the Illinois

Steel Company for a tentative trial. To grasp the importance of this change, I will describe conditions as they were in February, 1911. The eleven blast furnaces at South Chicago and the eight at Gary were operated just like all other blast furnaces in America, twenty-four hours a day, for seven days a week. It took about 1700 men to operate these furnaces, and most of them worked twelve hours a day and seven days a week. There was some Sunday work in open-hearth furnaces, though it was less than is general among the independent companies. In addition, not less than 600 miscellaneous workmen were required on Sundays for repair work, gas tending, firing boilers, and guarding property in the two big plants. That made a total of over 2300 who had either a considerable amount of work every Sunday or regular seven-day work who are now, if I am rightly informed, to be relieved.

I cannot believe that a company possessing the wisdom and sense of responsibility manifest in this action will permanently be willing either to favor or apologize for a twelve-hour day. Yet that, so far as I could gather, is the position of the operating officials of the Illinois Steel Company. For the evils of a twelve-hour day are even greater than the evils of seven-day labor. There is no industry where emergencies do not sometimes arise requiring over-time work. In the steel mills such emergencies often come in rush times and the ten-hour machinists, electricians, repair men, and laborers become twelve-hour men. In such cases also six-day workmen become for long periods of time seven-day men. And sometimes these emergencies occur even in periods of depression. I met a steel worker on the street of a Pennsylvania mill town last winter, at a time when the mills had been for months largely idle, and congratulated him on his opportunity to rest.

"Rest"! he yelled at me, "I haven't had a Sunday in five months!" He was a repair man. But if overtime oppresses the ten-hour man, what of the workman whose regular hours are twelve in number? Already overworked, an emergency requiring overtime means incredible hardship.

One who had observed carefully social conditions in South Chicago said of the steel workers, "Their day is twelve hours long and complete exhaustion is the inevitable condition." A South Chicago physician told me that the men are overworked and do not get rested from day to day;¹ that the result is an excessive alcoholism and premature breakdown; and yet, as nearly as I could judge, there is less drive in South Chicago than in Pittsburgh.

But whether a man is actually overworked or not, a twelve-hour day takes from a community and from the home the time that both have a right to demand from the citizen; and the result is a man handicapped with respect to his duties to everyone, including himself.

Night schools in South Chicago boom when the mills are idle, and go to pieces with the return of prosperity. The average man cannot hold down a twelve-hour job and then spend two hours in study at night. The testimony of night school teachers is that a man cannot be held long after he gets a job in the mills. Library facilities are poor in South Chicago. The Illinois Steel Company has not yet developed a Carnegie, but there are at least two branches of the Chicago Public Library near the mills, and a settlement in the vicinity has a library from which books may be drawn. But steel workers do not use the books. Many a man gets up at half-past four in the morning in order to be at the mill at six. Such a man goes early to bed even though he has a spell hand, and there is little time for reading.

The libraries are not the only sufferers from the twelve-hour day. I met a young married man in South Chicago who had a home indicating taste and refined judgment. He wanted to go down-town to theatres and concerts once in a while. He wanted a chance to hear something good sometimes; the nickel theatres near his home did not interest him. But he could satisfy his appetite for good things in music and the drama only by an investment of something of more consequence than the price of seats. He works twelve

hours a day—a schedule, he told me, "that just allows me time to eat and sleep—no more." This is what he said of it:

If I want to go to the theatre, here is what I am up against. It is just one hour and seventeen minutes from the time I leave the plant at night that the Illinois Central theater train leaves South Chicago. It takes me fifteen minutes to get home on the car, after I catch one; but I often have to wait ten to twenty minutes. Then I've got to wash, change my clothes, and shave; and after that there isn't enough time left to eat a good supper if I'm going to catch that train. It is twelve o'clock midnight or later when we get back home, and I've got to get up again at four-thirty in the morning if I'm going to get to work on time. So you can guess how much I go to the theatre.

In the last ten years the membership in the English-speaking churches of South Chicago has declined, although the number of English-speaking men in the mills has, in the same period, slightly increased. During the same period the vitality of the churches has at best remained stationary. In some respects it has declined. Ten years ago there was one institutional church maintained in South Chicago. Now there is not even one. A large majority of the pastors of these churches gave as the reason for the lethargy in their churches the twelve-hour day and the seven-day week. The testimony was general that such conditions "demoralize our work among the laboring people, for when they have the time or opportunity to participate in religious activities they are so nearly worn out that most of them prefer to remain at home and rest."

To the credit of the pastors of these churches it should be said that they sent a committee to General Manager Field, of the South Works, about two years ago, to protest against Sunday work. Mr. Field referred them to men higher in authority, and they went to President Buffington. As a result of their conference the latter is reported to have written to Judge Gary. Undoubtedly this movement of the ministers in South Chicago had an influence in bringing out the now famous order of the Steel Corporation in May, 1910, calling for cessation of unnecessary Sunday work.

Health, hours of labor, Sunday work—these are avenues of opportunity open to

¹The statements of other South Chicago physicians differed from this judgment.

the Illinois Steel Company. Some of them they have already recognized. But, as intimated above, there is more than an opportunity here; there is heavy responsibility, and there is no one but the company upon whom this responsibility can lie. The workmen themselves are denied any opportunity to share it, and the public has not yet demanded the right to interfere—indeed, it has scarcely interested itself in any way in the behalf of the workers who cannot speak for themselves. The public generally does its work on the other side. When South Chicago citizens thought that new construction had gone to Gary because Public Works Commissioner Patterson enforced the law and would not let the steel company build out into the lake, they went to Springfield 200 strong—business men, lawyers, doctors, and ministers—and lobbied for two weeks for a bill permitting the company for a merely nominal remuneration to fill in along the lake front and make new land. The measure was passed and the delegation of loyal citizens returned to South Chicago rejoicing. The Illinois Steel Company has a legal department that is perfectly capable of presenting arguments before a legislative committee, or, if pressure of legal business prevents, they have ample means for employing additional counsel to defend their interests. In spite of that, these 200 faithful boosters spent their time and their money in the interests of the steel company. It is to be hoped that the company was grateful.

But here is an odd thing. Through all the history of the South Chicago plant no delegation of citizens has ever gone to Springfield to secure legislation for a rest-day for the workers. After twenty-nine years, while ministers have sometimes petitioned the company and business men have stood idle, waiting for voluntary action, the company is at last granting a rest day. Nor in 1906, when forty-six men were killed in the steel plant, did South Chicago citizens leave their business to demand safety or compensation laws. They waited again for voluntary action, and it came—twenty-six years after the first steel was blown at the South Works. Nor have the citizens of South Chicago ever lobbied at Spring-

field for an abolition of the twelve-hour day, for better housing regulation, improved sanitary conditions, or for any other thing that is vitally connected with the welfare of the 10,000 steel workers who live within their borders. They have waited thirty years for these things and are still waiting. But when it was the interests of the company that seemed to be at stake, they waited only until the legislature met again, and then they literally stormed it—until they got what they wanted.

But it is the steel company that we are considering, not the citizens of South Chicago. The development of safety engineering by the company is a magnificent piece of work. In this departure it does not stand alone, though it has been a pioneer within the corporation. The work of accident prevention, the hospital system, and the plan of paying a fixed compensation to injured men all together constitute a policy within the United States Steel Corporation that is admirable.

But will the Illinois Steel Company stop here? A pioneer in safety work, the way is open to it as pioneer in the work for industrial health. The report of the Illinois Commission on Industrial Diseases showed that certain forms of disease no less than accidents constitute a just charge upon industry. And this was a report that just barely crossed the borders of the field of which it treated. It is so new a field here in America that no one knows how far it extends. It is thought by many that when this field shall have been fully explored it will prove to contain greater need for human conservation than ever did the industrial accident field.

If the Illinois Steel Company has reserves of courage and determination it will explore this field. It will find out the effects on the physical system of long hours of steady work, and it will study the question of vice and alcoholism among men who are kept on duty twelve hours a day, and who do not work all of those hours. It will find out more about gas poisoning, and it will consider the effect of heat on heart action. And if the Illinois Steel Company does all this, there will follow a new movement

for health that will be comparable to the safety movement and will be perhaps even farther reaching.

Ten years ago last summer there was a blast furnace explosion at South Chicago. It killed one man and severely injured several. But the Chicago newspapers were unable to print the facts just as they were because the steel company would not let them. Not only were the reporters barred from the mill yard, but the police and fire departments were kept outside! Finally, the general manager gave in to the extent of letting one police captain and one fire captain into the plant and to let himself be interviewed by the newspaper men. Even then he refused to disclose the names of the men injured.

"You may say that they were not badly hurt", he said, "We will take good care of them."

Last winter there was a not altogether dissimilar accident at South Chicago in which one man was killed and several were injured. But this time there was no secrecy, no attempt at concealment, no refusal of information. The names and addresses of all the men hurt were in the papers next day, together with the story of the accident. What the public was given to understand ten years ago to be none of its business it now

Chicago Record-Herald, July 2, 1901.

considers very emphatically a part of its business; and steel managers recognize that claim. Equally radical has been the change in attitude towards the accidents themselves, their preventability and toward the social and economic issues involved. It has been a change as great as the changes that have swept processes out of existence; as have lifted, and stretched, and revolutionized the great plants themselves.

No company ever had such a chance to make a new record, not in output and costs alone, but in human well-being, as the Illinois Steel Company has at Gary. New plant, new crews, new managers, no heritage of distrust, no remembrances of petty tyrannies, no dark history of strikes or of violence—it is an opportunity of a century. There have been mistakes, but that opportunity is still, most of it, there.

In only lesser degree is this opportunity true at the rehabilitated South Chicago Works. And in the cheerful optimism of the very name under which the campaign against death and injury is waged—the "safety-boosting"—we have a presage of what its logical sequence may mean if the conservation of the health of steel workers makes headway in the next ten years comparable to the change of front as to accidents in the last ten.

AN ELECTRICALLY OPERATED MILL MOTOR ROOM.

MOVEMENTS ABROAD EM- PHASIZING THE DIRECTION OF PROGRESS AT HOME

GRAHAM TAYLOR

There is a strangely prevalent movement of the people abroad. One is made conscious of it in every land, less by its organized, overt expression than by the set of the tide in the undercurrents which are everywhere felt. It reminds one of the impressions of Arthur Young as he went about France just before the Revolution, making the agricultural observations which he so naïvely describes in his Travels. While the prevalent discontent does not thrust itself so spasmodically or violently upon the traveler's consciousness, it is far more general throughout the whole working world. Half consciously concerted, it is only in small part organized, either nationally or internationally. Constructive in its purpose and plan for legislative method, it is only dimly conscious of the rapidly growing power with which it hopes to compel compliance with its ideals or to overcome, and if necessary to destroy, opposition to its progress. It seems to be all the more a resistless movement of life because it lacks commanding leadership. Like a silently rising tide it is checked by one barrier only to break through and overflow others. If one set of its councillors is thwarted and discarded, others rise from the ranks with new policies but essentially the same old purpose. Although less bent upon destruction than the revolutionists at the end of the eighteenth century, though less committed to definite programs than those in the middle of the nineteenth century, this social and industrial evolution of democracy in the twentieth century is all the more determined in its purpose to raise the standard of living and all the more set in its direction toward uniting all workers in each industry as a first step toward uniting the working world. Its network of more or less affiliated trade unions, labor federations, social-democratic organizations, and

parliamentary parties is far stronger and more permanent for effective effort to win national and international supremacy.

America is no longer isolated by the oceans which surround our continent. Our people no longer live apart. The United States has wakened to its world-consciousness. Although fortunately removed from continuous part in the international complications of the Old World, which are the perpetual nightmare of European peoples, the American people have irrevocably entered into relationships with all the world which will grow closer every year. By our immigrations from every land we are inextricably interwoven with the peoples of all the earth. Our ideals and purposes are being conceived and formulated into policies and legislation by growing majorities of those who brought with them across the seas, or inherited from their parents' fatherlands, the hopes and fears of the Old World that are only intensified by migration to the New. Progress here cannot diverge very widely from the direction of progress there. But upon the broader levels of our opportunity and with the greater intensity of our life the pace of the people's movement in America is sure to be far more rapid and its power far more irresistible than in any country of the world.

Movements abroad, therefore, not only indicate, but emphasize, the direction which progressive movements at home must take in order both to avoid failure and achieve success.

COST OF LIVING AND RATE OF WAGES

The first of these movements is the effort to adjust the rate of wages to the cost of living, in order to meet the demand of the rising standard of life. The rise in the stand-

A "LOAD" OF HAY AND GRASS.

ard of life is due both to education and religion. Religion has all along been emphasizing the ideals of life. The values with which it has estimated the worth of the soul are infinite. It has even weighed the life of God over against the life of man, and taught that the saving of the soul was worth the death of the Son of God. The Cross on which he died has been held heaven-high over the head of every man, who has thereby learned, by revelation of God, what everyone of woman born was made and meant to be. Education has deepened the apprehension and raised the appreciation of this religious teaching. It has not only quickened the aspiration to attain the higher ideal of the human life, but has also aroused the discontent with conditions of life lower than the better standards within sight and reach. The masses of men and women have, moreover, been edu-

cated to produce more by machinery than they ever did by hand, and have learned how to organize for the purpose of getting a larger share of their product.

With this movement of the mass, a great London weekly declares, "new life has entered the great masses of unskilled laborers." After religion thus strikes the earth under the feet of the common man, and when education makes every man count one in his own sight if not in others', the mass of common men rises as one man to demand: "If this is the kind of man the church reveals me to be and the school teaches me that I am, then give me the living of such a man, or at least the chance to earn it."

Responsive to this demand for a higher standard of life, which is at least compatible with the ideals inculcated by religion and education, great efforts are being put forth, both by co-operative voluntary agencies and by governmental action, to supplement wages insufficient to meet the emergencies of life, and to raise the rate of wages more nearly to cover the cost of living. By industrial insurance, which is more and more superseding the benefit schemes of trade unions and employers, and by old age pensions, to which the British government has nobly and bravely led the way, the first steps are being taken to abolish pauperism, if not poverty. Still further than this has British legislation led in establishing a minimum wage scale, beginning with chain-making, clothing manufacture, and two or three other of the lowest paid and "sweated" industries.

OVER-WORK OF WOMEN

Thus the world is called upon to protest against employment at less than a living wage. For in all the world whole classes of men, women, and little children are being crowded down below the life line, beneath which no nation can afford to have its people fall. Especially needful is this minimum wage law to protect not only the livelihood, but the health, life, and efficiency of women and youth in industry. All over the world the work of women increases in variety without lessening in burdensomeness. As of old they are still spinners and weavers, home-makers and house-keepers, child-bearers

and rearers of families. Now, as at the dawn of history, they are the agriculturalists of the Old World. The peasant woman of southern Europe rises long before dawn to feed the family and leave the house and children in safety. She goes with the men to work in the distant field. She drives the donkey, loads and unloads the heavy packs or carts. Before or after the day's work, she staggers under the weight of heavy water-jars, wine-casks, immense bundles of grain and grass, or saplings used in the vineyard. Returning home late in the evening from her full "man's job," this house-mother prepares the evening meal, puts the children to bed, and ends her eighteen-hour day by doing the family washing. In her earliest youth her back was bent under some of these burdens. In premature old age she spins and weaves or twists the twine for the fishing nets until sight fails and muscles stiffen. Then, at the end, like the old men, she too is often forced to beg on the highway, or end her days in the poor-house. The mill girls of Amalfi, of whom Longfellow sang in minor key, are still to be seen

Toiling up from stair to stair.

Those of them who have grown gray and wizened in bending over the piles of rags in the paper mills, and those whose girlish forms bend under the heavy burdens which they bear up and down the "stairway, not a street," toil on through their long days and shortened lives for twenty cents a day or less.

To the northward as well as the southward women sweep and sprinkle the public streets, tend street railway switches, load and unload coal and gravel from railway cars, are even porters and freight handlers, work on railway construction trains and in dining-car kitchens, are bar maids and beer-garden waitresses. And their wages are little, if any, more than half as much as men receive for the same work. Multitudes of women receive only from twenty to forty cents a day, and men from forty to seventy-five cents, even for work which requires skill.

LOW PAY AND HIGH PRICES

The British Government Board of Trade reports the average wages of all

"THE WEIGHT OF HEAVY WATER JARS."

workers employed in the metal, engineering, and ship-building trades to be twenty-seven shillings (\$6.85) a week, less than one-third of all the workers being employed on full time. The same authority reported the wages of 134,000 railway employes to be \$5 a week or less, of 107,000 to be between \$5 and \$7.50, and of 78,000 to be over \$7.50. Meanwhile, during the last thirty years, wages have risen only 6 per cent and the cost of living is officially reported to have increased 17 per cent.

This is the underlying economic cause of industrial discontent. The response which the British public promptly makes to the emphasis laid by the great transport workers' strike upon this impossible situation anticipated the report of the royal commission appointed to investigate the grievances of the strikers and to recommend remedies for them. Al-

WOMAN STREET CLEANER, MUNICH.

ready the government announces the establishment of an industrial council, composed of influential employers and employes, for the purpose of preventing and settling disputes injurious to the public welfare. Supplementing this government action, influential men in business, professional, and public life have signed and published a pronouncement declaring industrial conditions to be "thoroughly unsatisfactory," and recommending a general resort to co-partnership, which is declared to be applicable in some form to nearly every industry. "A co-partnership," it is affirmed, "assumes a standard wage before there can be talk of any profit to divide, and a standard wage assumes an organization to maintain." The right of collective bargaining is thus claimed for both employes and employers. Trade unionism is recognized as necessary for the meeting of capital and labor on equal terms. Co-

partnership companies are said to control more than one-half the capital invested by companies in England. The employes of the three London gas companies have acquired \$3,000,000 of their capital.

The direction of progress toward industrial peace and prosperity, as indicated both by the losses and gains of the nations in the Old World, is clear. It certainly does not tend toward stubborn struggles of endurance, the losses, tragedies, and perils of which surely need not be suffered in the New World, with the bitter experience of the Old World in full sight. Wise will we be in our day and generation if by just and conciliatory measures and relationships we try to adjust the rate of wages to the cost of living. Surely an intelligent people will find some other way of making this adjustment than by the brute force of strike and lockout, with all their perils to peace and progress.

BETTER HOUSING AND TOWN PLANNING

From the bad and better housing of the people abroad, and in the impressive movements for planning towns and cities the better to meet the needs and promote the welfare of their citizens, America may well take timely warning and suggestion. The miserable shelter for family life provided for the working poor in country, town, and city almost everywhere abroad presses upon one's sight and into one's heart. All through the sunniest open-air lands of the South whole families are crowded into single apartments, totally dark and unventilated, except for the single opening through the doorway. On the ground level these apartments look like caves in the rocks. They are the cooler for this, undoubtedly, in the heat of the day, but dangerously close and unsanitary when shut up at night or in the rainy winter season. Outdoor life through so many hours of the day, and so many days of the year, is the only reason why these cluttered, unhomelike, dreary dwellings of the poor are not more speedily their tombs. For such they come to be when cholera springs out of the dirt in the dark, or when tuberculosis is imported from America

by the returning emigrants. It is at least some compensation for the earthquake at Messina to find the neat little homes—built with American lumber and money—for single families, and bearing on one corner the street names, "Via Roosevelt" and "Via Bicknell."

In Germany, in the large cities, the housing problem is even more serious. Of 2,000,000 or more persons living within the inner limits of Berlin, over 700,000 are reported to be housed in single rooms. Of these fully 500,000 share these single rooms with from three to twelve or even more others. The greatest problem of the German capital is to provide houses for 1,000,000 wage-earners, upon whom the industries and commerce depend. If salaried business people with incomes of \$4,000 or \$5,000 cannot own their homes within the city limits, what hope have wage-earners of even renting adequate apartments? The real estate of Berlin, on which over 2,000,000 live, is owned by only 1 per cent of the population. Building sites are so costly that only five-story dwellings, accommodating as many families or single lodgers as can be crowded into them, yield sufficient income to warrant investment, even in the suburbs. The poorest paid workers, who receive less than \$300 a year, pay nearly one-third of all their earnings for rent. Those earning between \$600 and \$700 pay less than one-quarter of their incomes in rent. But persons earning from \$4,000 to \$5,000 pay only 10 per cent of their incomes, while those receiving from \$8,000 to \$12,000 pay only 5 per cent for their better apartments. This means hopeless poverty for the poor. And yet the destructive disproportion between rent and income increases with the years.

It is not surprising when immigrants who have lived under such conditions come to America that they at first do here as they did in the old country. They crowd our tenement districts and houses because almost all of them, whether they come from city or country, have lived in stone buildings built three or four stories high, to shelter several families in scant space. They do not object to dark basement rooms or to going high up-stairs, because they have always done so. They still keep their windows closed at night as they have always done to shut out the malaria which they fear will come in with the night air. Here, as there, it takes time and patience on their part and ours to get them to understand and make adjustments to the new conditions under our very different climate and sanitary regulations. But the influence of even a short residence in America is greater than we or they realize at first. Upon their return to their native villages they are inclined to build smaller, detached houses for the separate use of single families, and to provide windows to let in the light and air. These one-family houses are so little known in Italy that they are called "*Americano*" by the natives. It will take a far longer time than the life-time of the first generation for the Italian peasants to endure the loneliness of our isolated farm-houses in America. In Italy even the field hands live in hamlets, vil-

TWISTING TWINE FOR FISHING-NETS.

lages, or towns, under conditions far more like those of our cities than any of our farming households or communities furnish. Unless they are enabled to live together in little centers built for farm laborers, Italian families will rarely come to or stay upon our large and widely separated farms. They object less to the distance between these village homes and their work in the fields than they would to living their family life apart from the community life, as almost all have always been accustomed to do.

With these bad housing conditions, however, European peoples have begun to struggle valiantly and effectively. Building associations restricted to a low rate of profit on investments are providing attractive, comfortable dwellings at very cheap rental to thousands of wage-earners. In the buildings of one such association in Frankfort about five thousand persons are well housed. The houses are artistically designed. They are built around a large open space, a part of which is a park for common use, while other parts are cultivated by the occupants of the apartments as vegetable and flower gardens. Laundries are provided for common use, and rooms for nursery and kindergarten purposes. In a separate building these dwellers have a *Verein-Haus*, or social center, for their own use, containing club and class rooms and an assembly hall. It is like a social settlement for the block or group of apartment buildings owned

and managed by this association. Instead of permanent "residents," volunteers come in from elsewhere to help the people use their public rooms for larger pleasure and profit. Thus, one group helps with the day nursery, another with the kindergarten, and individuals come in the evenings to provide entertainment and to lead classes.

Apartments of two rooms and a pantry, with a gas cooking-stove and a kitchen garden, rent for \$6 a month, three rooms for \$7. Gas is furnished by a slot meter, at two cents for three hours' light or heat from a single burner.

Town and city councils are building new and improved houses in the places of old and unsanitary tenements, which are bought to be demolished and thus replaced. Garden city enterprises have, as articles in *THE SURVEY* have recently detailed, made great strides in England, where the co-partnership housing associations are so successful. Bourneville, Hampstead, Letchworth, and the more paternal scheme at Port Sunlight all show how housing reform has appealed to the good sense of the English people.

Town planning, so well exemplified in these garden suburbs and cities, is developing a new profession for men skilled in landscape gardening, the building arts, and in interpreting and meeting social needs. They are in demand not only for the construction of new towns, but more often for the reconstruction of old ones. They are introducing a new

engineering. They furnish an accurate survey of the town as it actually is, and show where and how it can be better adapted to the present and future needs and inspirations of its citizens. As this new kind of a city comes into being, it is found to be not less but all the better adapted to trade and in-

THE NEW MESSINA—CORNER OF "VIA ROOSEVELT" AND "VIA BICKNELL."

dustry for being planned to meet all the greater needs of its population. The town planning exhibits which were held at Düsseldorf and Berlin not only demonstrated the fact that a large number of European cities are being made over to meet new needs and greater possibilities, but also stimulated many others to desire and initiate plans for their betterment. Conspicuous among the towns of Germany which have led this movement is Düsseldorf. Although its officials are more capable of drafting plans of their own than those of any other German municipality, they preferred to promote the movement for town planning by offering prizes for the best competitive plans. Their specifications imposed on the competitors are in themselves worthy to constitute the basis for a far-sighted, far-reaching design to provide for the future growth, efficiency, and social development of their city.

Far more readily and less expensively can town planning be promoted and carried through in our new land, among our half-grown cities, and with our freer land tenures and laws. Housing and health interests, business efficiency and recreation facilities, manufacturing advantages and residential reservations may all better be provided for in advance by one comprehensive plan. The time may come when, by contrast with these scientifically and artistically planned cities, those that have been allowed to grow up in a fortuitous and desultory way will seem as irrational as a building which gives evidence of having been put up piece-meal without any discoverable design or adaption to any purpose.

EXTENSION OF SUFFRAGE AMERICA'S SAFETY

Another point at which the direction of American progress is emphasized both by repressive and revolutionary movements abroad is the wide and yet increasing extension of the suffrage. The streets of Brussels witnessed a popular demonstration that has the making of history in it. At the call of the socialist party—in which, however, others joined—over 60,000 men from the larger and smaller places throughout Belgium took a day off last August, without

DARK UNVENTILATED HOUSES IN THE
SUNNIEST LAND.

wages, and paid their own way to the capital of their country in order to voice their protest against the unjust inequality of the suffrage. It was more than a protest. It was the patriotic proclamation of Belgium's one great hope of national evolution without revolution. On the banners carried in this great procession, which required over four hours for its rank and file, marching ten abreast, to pass a given point, were these figures:

993,070 citizens have	1 vote each....	993,070
395,866 citizens have	2 votes each....	791,732
308,683 citizens have	3 votes each....	926,049

Thus a majority of 724,711 votes were cast by 188,521 fewer than half the voters!

This is the "pièce de résistance" of the whole situation in Belgium and wherever else it obtains. It closes the door to hope for the better conditions which the majority demand. It begets the des-

peration always sure to follow the "hope deferred which makes the heart sick." Farther-sighted than our fears over the complications of our extended suffrage is the courage of our forefathers and of all their sons who are loyal to democracy. For, however difficult, and even dangerous, may be the stress and strain upon our institutions to live up to our standard of manhood suffrage, and now to face the clear possibility of woman suffrage also, the lack of that greatest of all safety-valves would be very likely to be a still greater danger in view of the world movement toward social democracy, which is sure to have the most rapid and intense development here in America. But if this be the direction of our progress which is emphasized by the ominous events and portents abroad, it involves a far more direct and prevalent effort to train our people for citizenship than we have yet made. Crises in the nations of the Old World are trumpet calls to us in the New to use our schools and settlements, our churches and public libraries, our recreation centers and industrial organizations, our fraternities and social fellowships, to train our own youth and our foreign-born fellow-citizens for American citizenship, and to strengthen and hasten all the forces available to assimilate them into the body politic.

RELIGION FOR DEMOCRACY

Last, but by no means least, even

greater than all other conditions of progress, emphasized both at home and abroad, is the absolute necessity of applying the sanctions, the ideals, the sacrificial spirit, and the patient passion of religion to the problems of democracy. One of the keenest critical analyses of modern society thus impressively sums up its conclusions:

Nothing but a church will do. All the other schemes of democracy have come to naught for want of that. The lecture platform is no substitute for Sinai. Democracy is a religion or nothing, with its doctrine, its forms, its ritual, its ceremonies, its government as a church—above all, it organized sacrifice of the altar, the sacrifice of self. Democracy must get rid of the natural man, of each for himself, and have a new birth into the spiritual man, the ideal self of each for all. Without religion, how is man, the essentially religious animal, to face the most tremendous of all problems, social justice?

Such is the challenge with which the movements of life confront religion. All too long delaying, if not too late to lead, churches of the Old World and the New are at last responding in varied efforts to apply their common faith to the social conditions and movements of the common life. It remains to be seen whether the evolution of social democracy is to have the advantage of an affirmative, constructive, considerate leadership such as only the religious motive can supply, or whether, like the revolutions which have come to naught, it will develop crass materialism and a class-conscious selfishness which will be its own undoing.

THE PITH OF IT

A Philadelphia "Charities Building" is in the making.—P. 1180.

Coming only to play their allotted parts in the program, Governor Woodrow Wilson of New Jersey, Governor Stubbs of Kansas, the regents of the University of Wisconsin, and others of like prominence found the Social Center Conference at Madison such an engrossing undertaking that their trains pulled out with them in the heat of round table discussions. An American social service association was launched, and William Allen White and other newspaper men got together to map out their part in the work.—P. 1169.

Business expansion and big civic plans are under way in the Northwest; now comes a mustering of forces to work out a social program in advance of the revolutionary change which the opening of the Panama canal, and the landing of Mediterranean immigrants on the wharves of Seattle, will usher in in 1915.—P. 1178, P. 1181.

Judge DeCourcy of the Superior Court of Massachusetts, at the Omaha Prison Conference, riddled the "meaningless verbiage and circumlocution" which not only encumber much criminal procedure, and insult the English language, but result in liberating men guilty of the most grave crimes. Read, if you will, of the "dangerous and deadly weapon, to wit, a club, then and there of the length of four feet, of the breadth of two inches, and of the weight of ten pounds" which was insufficient to drive common sense into the reasoning of the supreme bench of Missouri.—P. 1172.

On the other hand, the secretary of the National Child Labor Committee, quoting from the vigorous dissenting opinion of Chief Justice Clark of North Carolina, shows in a case just decided how the tradition of the law o'ertopped "the other side" when the life of a little child and a railroad corporation—its employer—were in the balance.—P. 1181.

Mine owners, state mine inspectors, and engineers from Washington, Colorado, Alabama, and all the nearer fields attended the safety demonstration carried out last week at Pittsburgh by the Federal Bureau of Mines. A descriptive article will be published in *THE SURVEY* for Nov. 2.

Can an orphan choose its grandparents? Dr. Goddard's recent protest against the indiscriminate placing-out of defective children provokes a sheaf of replies.—P. 1187.

"What is the use of adopting resolutions condemning the sale of our products in resorts and dives?" asked the president of the Houston Brewing Company at the International Brewers' Congress in Chicago. "What's the use when it is well known that most of them in the large cities are in some way owned or controlled by the brewers?"—P. 1175.

THE COMMON WELFARE

MADISON MEETING ON SOCIAL SERVICE

Madison, Wis., was the meeting place, October 25-28, of the first National Conference on Civic and Social Center Development in America. It was a conference to be remembered. From New York to California, from Texas to North Dakota, delegates came representing city clubs, boards of education, welfare committees, churches, universities, and various associations for civic and social betterment. A new spirit of enthusiasm, a new hope for the future, a fresh and eager interest in the interchange of ideas and experiences seemed to fill the air. Before an audience which filled the large gymnasium, E. J. Ward read the greeting sent to the conference by Edwin Markham, author of the *Man With the Hoe*:

We men of earth have here the stuff
Of Paradise. We have enough!
We need no other things to build
The stairs into the Unfulfilled—
No other ivory for the doors,
No other marble for the floors,
No other cedar for the beam
And dome of man's immortal dream.

Here on the paths of every day—
Here on the common human way
Is all the busy gods would take
To build a heaven, to mould and make
New Edens. Ours the stuff sublime
To build eternity in time!

During the three days of a varied program this underlying thought was repeated: that here on earth we have both the tools and the workmen with which to build a New Democracy.

With the cooperation of all the educational forces of the state and nation, we may be sure that the day will finally dawn when the ideal condition shall come, when each child shall be broadly educated to the extent of his powers and at the same time educated for his vocation, and this without reference to condition of birth,

said President Van Hise of the University of Wisconsin in his address of welcome.

"This movement is a recovery of the constructive and creative instinct of the American people," said Governor Wilson of New Jersey, the principal speaker of the opening meeting.

We can not have liberty where men are not seeking common ends by common means. Community means a people united by their common interests. Men are at present so disconnected that the tides of life will not flow. To release the common forces, to unite the feelings and clarify the comprehensions of men, this is the use of the civic center.

Prof. Forbes of Rochester:

The movement for the wider use of school buildings is built upon the underlying assumption of democracy that the spirit of goodwill is in the average man, and that this spirit may become dominant.

William Allen White, proprietor of the *Kansas City Star*, reached the climax of his speech, entitled, *What's the Matter with America*, when he said:

It was the Town Hall that defeated Cornwallis and it is the Town Hall that will defeat those standing in the way of democracy today.

How to make the school building a true center of civic and social betterment was discussed under an almost bewildering number of heads: the school house as a center of all forms of wholesome recreation, as a local health office, as a branch public library, as an employment station, as an art gallery, and even as a branch legislative reference bureau. There were talks upon the social center and the rural communities; talks upon the significant beginnings, many of them for the first time coming to light; and for the benefit of those who want the concrete expression of a philosophy, there was a statistical sur-

vey of the whole civic and social center movement, showing that seven state universities have adopted the propagandism of social centers as a recognized part of their extension programs, and over one hundred cities in the United States are now using their public school buildings to promote the civic and social welfare of the community.

Before the close of the conference, which will be reviewed in a later issue, a national organization was formed, to be called the Social Center Association of America. The second conference will be held at the University of Kansas. Some of those in attendance returned from the meeting voicing the belief that the "new association may be the means of unifying the forces at present working for the New Democracy."

PENOLOGY'S NEW VIEW OF BODY AND SOUL

Speaking on What makes the Common Welfare, Prof. Franklin H. Giddings, of Columbia University, recently declared that the thing to be striven for—more pressing than to supplant ignorance with education, or poverty with comfort—is to supplant a low moral practice with a high one. Conduct in this country, said Professor Giddings, has noticeably degenerated within the last fifteen years. The prevention of crime, petty and gross, he regarded as today the first duty of the country's citizenship. Such a preachment has of course a much wider social application than the range of topics concerned before the specific national body convened in the treatment of the criminal; yet the point of view found application in more than one session of the American Prison Association at its meeting in Omaha last month; and along with it came the insistence that the first step in the establishment of a higher moral practice is to discover the physical and psychological causes of crime. Not a new prerequisite,—yet when Dr. William Healy, director of the Juvenile Psychopathic Institute, Chicago, asked where in all America a thorough official study is being made of how well we are succeed-

ing in suppressing crime, there was no answer. He declared that the "crime situation" can be improved "only through accurate studies and treatment of the problems of causation of crime in the individual himself." The court may be confronted with a boy suffering from nervous conditions which are the result of an old fracture of the skull, and which, together with eye-strain, render him irritable and intolerant of noises, and cause him to run away and to take part in theft; or with a victim of vicious heredity and impotent will, for whom the only result of the "short term" is a wider acquaintance with criminals; or with a normal lad who, suddenly discovering that his family has been lying to him about his parentage, in his bitterness accuses all men of being liars, and definitely elects to be an enemy of society for life. Whatever be the nature of the case, said Dr. Healy, it will inevitably remain true that, despite theories and systems, a careful study of individual delinquents will be necessary before you can ever know what is best to be done:

In all common sense the action taken should not be swayed on the one hand by the existence of a definite retributive system nor on the other hand by a sentimentalism which connotes coddling The new Hungarian law with its intimate study for a week or two by several qualified persons before determination of the measures to be pursued with the young offender is a splendid start on the right road.

The most vital points of vantage for checking a criminal career are generally overlooked by police and court methods. How should we know about the possibilities of individuals without hours of investigation and observation? The over-worked judge usually knows little of what the individual needs in the way of discipline, and not much about the treatment which he is officially prescribing. Our general system is simply that of wholesaling punitive measures, with a singular lack of adjustment of ends to needs.

Coming to the effect which investigation has upon the delinquent himself, and speaking of the work of the Chicago institute, Dr. Healy said:

We find that, if a young delinquent is approached with rational inquiry, in nearly every case he will respond with a totally different attitude from that assumed towards the police

or the court, and not only he, but his family, will usually regard him as a problem to be solved, and will give information that should not be neglected if a common-sense adjustment of the case is undertaken. Many a fellow with quite a career wakes up for the first time to self-consciousness and self-help from the moment that a thorough-going inquiry is started.

Declaring that the actual or potential recidivist is the delinquent in whom society should be most interested, Dr. Healy asked:

What is the recidivist mentally and physically? What is his career under the present system of handling crime? How well could his career have been predicted if one had studied him early and what measures could have been undertaken to check it? What can be done by physical up-building, by introducing definite mental interests, by a short term of punishment, by a long separation from former environment; is permanent segregation necessary; is there any likelihood of success outside of an institution? These are the scientific and common-sense points towards a knowledge of which intensive study must be directed.

But whatever studies are undertaken it must never be forgotten that crime is conduct and that conduct is an attribute of mind. Whatever may be the influences which shape mentality, whether they be environmental, hereditary, physical, or what not, it still remains that, when directly considered, conduct, and therefore crime, is a psychological matter.

EYE-STRAIN AND CRIME

Dr. Healy's contentions as to the importance of physiological factors in criminality were reinforced by Dr. William M. Richards, of New York, whose experience has included service in hospitals and as health officer. Underneath every crime, said Dr. Richards, is some kind of incompetence, and underneath incompetence is some kind of physical defect, either inherited or acquired. By this he did not hold that physical defect is the only cause of incompetence and crime, but that it is the chief cause, and it is the foundation upon which incompetency and crime are based. Said he:

The incompetent is born with bad eyes which make him unable to do near work without suffering; is born with a club foot which hinders physical activity, or with some blood disease which interferes with mental processes. These are examples of congenital defects. He injures his nose, which eventually causes catarrhal deafness, or he acquires

tuberculosis of the lungs, spine, hips, or lymph glands (scrofula), or lateral curvature of the spine. This last often comes from as simple a thing as writing at school on a desk the top of which is horizontal instead of being inclined at an angle of thirty degrees, which would enable him to see the point of his writing instrument without turning his head on one side. Again, through the continuous standing posture necessitated by some occupations, such as those of policemen, clerks, street car motormen, and conductors, the individual acquires falling arches of the feet (flat foot), by many erroneously called rheumatism of the feet and legs. The influence of these afflictions is wide-spread and causes incompetence in various ways.

The following passage on eye-strain is typical of Dr. Richards's interpretation of the relation between defect and delinquency:

In the De Witt Clinton High School in New York is a class of thirty-seven defectives who failed in every subject. They were put in charge of the physical culture instructor who reported to the principal that they were "a lot of crooks, thieves, and gamblers." The most cursory examination showed that the sight of these defective boys averaged less than half as good as that of a class of normal boys in the next room. Does it require any special gift of prophecy to foretell that in the course of the next ten or fifteen years almost all of these boys will go the usual route of crime, reformatory, and prison? The American Association for the Conservation of Vision tried to obtain \$150 for two months' salary for a young doctor who wished to fit these and similar boys with glasses. It was unable to obtain this money. If we multiply \$150 a thousand times, we will get a conservative estimate of what those boys will cost the community before they die in penal institutions. How much cheaper it would have been to supply them with glasses! Defective eyesight and its consequent discomfort in school leads to truancy. Every criminologist knows that the majority of criminals were truants when children. This is the way it works. Being idle, they fall in with idle people who form the only society available during working hours—and we all know who finds "mischief for idle hands." Idle people must live, and if they have none to support them, they soon drift into crime. The truant learns through them to indulge in petty larceny or pocket-picking, which eventually results in arrest. This frightens him and he tries to reform, only to find, as he found in school, that he dislikes near work, or that it causes some kind of discomfort. He craves amusement, good clothes, and good food—just what we all work for—and the price of these is always money. He is tempted and again stoops to crime. The reformatory is his next residence, and it is as good a place for this purpose as it can be made, considering

the disadvantages under which it labors, one of the most serious of which is the fact that confirmed criminals are frequently sent there, and the boys learn from them what they do not already know about successful methods of crime.

To show the prevalence of the defects cited Dr. Richards referred to tests made at Elmira Reformatory, which indicated that 56 per cent of the boys suffered from serious impairment of eyesight, and at the Rahway, N. J., Reformatory, where more thorough examinations found 83 per cent needing glasses.

LEGAL HAIR-SPLITTING IS BEYOND PALE OF SCIENCE

These pleas for enlightened inquiry into past life and physical constitution as the first act of the law toward offenders were no less emphatic than the arguments for a more enlightened criminal procedure as the second act. Prefacing his report as chairman of the Committee on Criminal Law Reform with statistics from which he drew the conclusion that gross crime in this country is less punished now than formerly, and less than in other countries, Judge Charles A. DeCourcy, of the Superior Court of Massachusetts, declared for reforms in technical pleading and trial procedure—the latter including jury trials, the technical rules governing evidence and instructions of the court, the granting of new trials, and needless delay. In illustrating abuses in pleading, he pointed out that the purpose of an indictment, information, or complaint is to enable the accused to know what the offence is with which he is charged, and to enable the court to enter such judgment as will prevent a second prosecution for the same offence. This ought to be done, he held, in simple and concise language. How it is done in many jurisdictions he illustrated by the following indictment for murder in a Missouri case [State vs. Woodward, 191 Mo., 167 (1905)]:

That G. W. and C. W., late of the county of P and state of Missouri, on the 16th day of January, 1904, at the county of P and state of Missouri, did then and there, in and upon the body of one E. P., then and there being unlawfully, wilfully, feloniously, premeditatedly, on purpose, and of malice afore-

thought, make an assault, and with a dangerous and deadly weapon, to wit, a club, which said club was then and there of the length of four feet, of the breadth of two inches, and of the weight of ten pounds, and which said club the said G. W. and C. W., then and there in hands had and held, the said G. W. and C. W. did then and there unlawfully, wilfully, feloniously, premeditatedly, on purpose, and of their malice aforethought, strike and beat him, the said E. P., at and upon the right side of the head of him, the said E. P., with the club aforesaid, and inflicting on and giving to him, the said E. P., in and upon the right side of the head of him, the said E. P., one mortal wound, which said mortal wound was of the length of four inches and of the breadth of two inches, of which said mortal wound the said E. P. from said 16th of January, 1904, the year aforesaid, in the county aforesaid, until the 18th day of January, in the year aforesaid, in the county aforesaid, did languish and, languishing, did live, on which said 18th day of January, in the year aforesaid, the said E. P., in the county and state aforesaid, of the mortal wound aforesaid, died; and so L. L. C., prosecuting attorney, upon his official oath as aforesaid, doth say that the said G. W. and C. W., him the said E. P., in the manner and by the means aforesaid, wilfully, unlawfully, feloniously, premeditatedly, on purpose, and of malice aforethought, did kill and murder, against the peace and dignity of the state.

To Judge DeCourcy's mind, if there were no other objection to this meaningless verbiage and circumlocution than that it is an insult to the English language, it ought to be abolished. But the objections, he urged, are far more serious. Informalities in the form of such absurd indictments, and variances between their allegations and the proof offered, result daily in liberating men who are guilty of the most grave crimes. In the case cited, although the jury found the accused guilty of murder on evidence fully proving the case, the Supreme Court set aside the verdict on the ground that the indictment did not clearly show whether the mortal wound was inflicted with the club! And the same court, in a recent case [State vs. Campbell, 210 Mo., 202] set aside a verdict in a rape case because the indictment recited "against the peace and dignity of state," omitting the word "the"! In Alabama a conviction for stealing hides was recently set aside because the indictment failed to state whether they were mule, cow, goat, or sheep hides (State vs. West). Indict-

ments were dismissed because father was spelled "farther" (in South Carolina); because the letter "i" was omitted in spelling malice (in Alabama); and where the indictment spelled "brest" (in North Carolina). Texas furnishes a large collection of cases that suggest the ancient doctrine of Hale's Pleas of the Crown, "Murervit instead of murdravit vitiates an indictment for murder."

Whatever justification there was for such technical pleading in the days of the savage penal laws of the long ago, there is absolutely none, held Judge de Courcy, for their survival in the twentieth century. Public opinion, acting upon legislatures and courts, has already secured the reform of simplified pleading in England, in the federal courts, and in the more progressive state courts. To-day, he urged, public opinion must be directed to obtain like improvement in legally backward states, where exaggerated adherence to mere form and consequent sacrifice of substantial justice are giving to our country as a whole a reputation for lawlessness.

Setting forth that the need for reform is equally glaring in other branches of procedure—selection of juries, reversals based on errors not affecting the merits, the granting of new trials, etc.—Judge De Courcy finally gave as the belief of the committee

that the time has come for seriously considering a modification of the unrestricted constitutional guaranty against incriminating testimony by one accused of crime—a rule enacted when a defendant was not allowed to be a witness in his own behalf. These constitutional immunities are invoked to-day in favor of crimes involving complicated corporate and financial transactions, with the result that in the popular opinion the machinery of justice has broken down. In all criminal cases power should be given to a committing magistrate to examine a defendant and demand an explanation of the circumstances which have created suspicion against him; and his failure to explain or to take the witness stand should be made a legitimate subject of comment by the state's attorney in his argument to the jury.

THE NEED FOR ADEQUATE PENOLOGICAL STATISTICS

Imprisonment, or release on probation, the two forms of treatment which in the practice of several American states are equally open to the state once the

ordeal of criminal procedure is over and the offender convicted, were taken up from many angles. Prof. Franklin H. Briggs, superintendent of the State Agricultural School at Industry, N. Y., and chairman of the Committee on Prevention and Probation, declared that prevention transcends probation just as prophylaxis transcends medication. The construction of prisons, recreation, religion and disease in prisons, payments to families of prisoners, discipline, the prison physician, pardons—these and other factors received discussion. The action taken by the association at the instigation of Kate Barnard, commissioner of charities of Oklahoma, in creating a committee to go into the subject of prison labor was, as pointed out in THE SURVEY for last week, the most dramatic event of the Omaha meeting. Bearing upon all these phases of work and accumulating experience was the need brought out for more adequate penological statistics. Hastily reviewing the almost farcical want of such statistics in this country—a want which struck sharply the foreign delegates to the International Prison Congress a year ago—and attributing this lack in the United States in part to that division of governmental powers which places the treatment of crime in the hands of the separate states, Eugene Smith, president of the Prison Association of New York, and chairman of the special Committee on Statistics of Crime, outlined the value of criminal statistics.

It is a matter of supreme importance to know whether, and how far, the tenderness of the modern law toward children serves to rescue them from a life of crime—to know whether the clemency of the law toward adults by suspension of sentence and probation promotes their rehabilitation, and to know to what class of offenders this clemency may properly be extended. These vital questions can receive final answer only by following the subsequent career of the offenders to whom these methods are applied and thus gaining data for statistical tabulation.

There should be established in each state a permanent board or bureau of criminal statistics, as an independent body or as a department of the office of the attorney general or secretary of state. This bureau should prescribe the forms in which the records of all criminal courts, police boards, and prisons shall be kept and should specify the items regarding which entries shall be made. The forms pre-

scribed by it should be uniform as to all institutions of the same class to which they respectively apply. The bureau should issue general instructions governing the collection and verification of the facts to be stated in the record; it should also inspect and supervise the records and enforce compliance with its requirements. Such a bureau might secure a collection of reliable statistical matter, uniform in quality throughout the state. Indiana is now, it is believed, the only state in the Union where such a bureau exists.

But even this result is not enough. Records uniform for each state only would not be available for comparison or for the purposes of a national census. It is not chimerical to believe that through the dominating influence of the Federal Census Bureau tactfully exerted on such state bureaus, a uniform system of statistical records relating to crime could ultimately be established throughout the United States.

AMERICAN REFORMS DEMANDED BY WORLD-WIDE STANDARDS

Prof. Charles R. Henderson of Chicago, the American member of the International Prison Commission, reviewed the resolutions passed a year ago at the quinquennial meeting of the International Prison Congress in Washington. He summarized as follows some of the urgent demands which the discussion at Washington has forced anew upon public attention in the United States:

1. The supreme purpose of prisons and preventive measures is to protect and promote social welfare, including, so far as possible, the real interest of the offender.

2. The treatment of the convict must be more thorough, prolonged, and determined than it has been, or can be, under the system of fixed sentences.

3. The administration of the treatment must never be arbitrary nor in contradiction to the modern constitutional division of responsibility between the legislature, courts, and administration.

4. A state central board, with judicial powers somewhat analogous to those of juvenile courts, should be invested with the authority to administer the parole system. It should be constituted in accordance with the principles approved by the International Prison Congress at Washington.

5. The different methods of dealing with youth, morally enfeebled and perverted adults, improvable younger offenders, and habitual or dangerous criminals should be given a permanent legal basis; and state institutions should be provided for affording treatment adapted to the character of each group, with large opportunity for individual treatment.

6. That such treatment may be guided by thorough knowledge of the character of the offenders, persons of training should be employed by the state to assist the administration in the observation and study of the life histories of convicts; and a scientific record should be kept of the conduct of paroled persons to show the actual results secured.

7. The parole system should be made effective by provision for an adequate number of competent and trained parole officers.

8. The probation system should be developed and administered so as to avoid, as far as possible, prison treatment for non-criminal offenders.

9. All institutions for dealing with offenders, and especially county jails, should be brought under central state control. Jails should become places solely for detention awaiting trials, and all persons convicted of crime should be transferred at once to state institutions established in convenient districts in large states.

10. State and municipal organization of agencies should afford protection and watch-care for unmarried mothers, illegitimate infants, and all children in moral peril. (Resolutions of fourth section of the Washington Congress.)

NATIONAL ASSOCIATION OF JUNIOR REPUBLICS

To unify and give greater effectiveness to the junior republic movement, and to aid existing republics in their work, the National Association of Junior Republics has effected a permanent organization by incorporating under the laws of New York. Semi-annual meetings will be held, one in the spring at Freeville, N. Y., the other in the fall at one of the other republics. A national Board of Directors composed of thirty persons was elected.

These things were done October 16 at Annapolis Junction, at a meeting attended by delegates from the George Junior Republic, Freeville, N. Y.; the Litchfield Republic, Litchfield, Conn.; the National Republic, Annapolis Junction; the New Jersey Republic, Flemington, N. J.; the California Republic; the Carter Republic, Readington, Pa.; and the George Junior Republic, Grove City, Pa.

It was on July 10, 1895, that William R. George, originator of the movement, got off the train at Freeville, N. Y. with a band of over 100 boys and girls brought from the eastside of Manhattan. He had hoped to begin his experiment of

reforming wayward youths by life in a miniature republic patterned after the United States of America on the Fourth, but delay was experienced in starting.

From an object of jest and incredulity among many penologists, the junior republic idea—being in essence the application of self-government to the problem of reform and development—has thus in sixteen years grown to the proportions of a nationally organized and accepted movement. It has even spread to England, where the announcement was recently made that the money, the land, and the superintendent for a junior republic there had been secured.

The visitor to one of these republics, knowing that life there is ordered, industrially, economically, politically, by the boys and girls just as adult citizens make up and carry on the larger republic, is surprised to learn that the highest ambition of a citizen is not to become president but to be judge of the Citizens' Court. He learns that not only are there all the other usual offices—president, secretary of state, of the treasury, etc.—but that there is a town meeting, a jail, a court house, and he sees in operation a complete system of court procedure, running through affidavits, search warrants, warrants for arrest, bail bonds, and all the other papers that delight the juvenile pleader. He sees shops in which industry thrives; he makes purchases with the exclusive coin of the realm, and he sees sanitary conditions and standards of weights and measures with the stamp of boyhood sanction upon them.

THE BREWERS AT CHICAGO

The ability and ingenuity shown in successive issues of the Brewers' Year Book warranted the expectation that the second International Brewers' Congress and Brewery Exposition would display the same qualities. This promise was amply lived up to in the remarkable exhibits which filled all the space in the great Coliseum in Chicago. The most significant of them, from the public point of view, were the effective devices, processes, and machinery for filtering and purifying beverages, and for cleansing

and sterilizing the bottles and kegs in which they are transported. The supply of clear and clean beer thus made possible seems to have put the product of unsanitary breweries out of the market. The manufacture of "cloudy" beer is said to have been rendered unprofitable. It was pointed out that imported beer, containing so little alcohol as to require acid preservatives, cannot compete with the home product which is thus more carefully manufactured. Those who are contending for pure milk points to these results to show both the possibility and practicability of making the production of pure milk also profitable, under uniform legal regulations.

The proceedings of the brewers' congress consisted in large part of discussions which were of more interest to the constituent trades than to the public, although some of them appealed to scientific interests with an ingenuity which savored of special pleading. On the whole, however, social workers in attendance felt that it was a dignified and impressive display of a vast industry which did not ignore the social and moral evils involved in it and even openly faced the demands for their correction by the trade itself. A resolution submitted by the section of the congress devoted to sociology and physiology, and adopted by a unanimous vote, declared: "That public drinking places which are the haunts of vice are dangerous and should be eliminated."

In urging its passage the president of the Houston Brewing Company of Texas said it simply told a truth of which they were all aware. "There can be no doubt," he remarked, "that the sale of beer or any other liquor in resorts and dives should be stopped." He claimed that the brewers in Texas are gaining their fight against total prohibition because they have severed their connections with such resorts. Then he asked with even greater frankness:

What is the use of adopting resolutions condemning the sale of our products in these resorts, when it is well known that most of them in the large cities are in some way owned or controlled by the brewers? If the brewer does not own the license, he owns the

building, or is in some other way responsible for the place.

The speaker warned his associates that public sentiment has reached the place where this thing will not be tolerated. Some of you think that the fight against the prohibition wave has been won. This is no wave, I tell you, and the fight has just begun. The owning of these places and the protection of them by the brewing interests is the thing which gives us the black eye. The anti-liquor forces take this fact and make capital of it, as they justly should. The hope of the brewing interests is to be found in the elevating of the saloons. This cannot be done by resolutions, but must be done by the brewer severing his connection with places of ill repute.

The facts upon which this remarkable speech was based were gathered by the speaker himself in the large cities of the United States. It was heard in silence and was followed immediately by a unanimous vote for the resolution quoted above.

Among other minutes adopted were the following:

Resolved, that the characters of persons licensed to conduct a retail liquor business should be subjected to careful scrutiny, and only those whose records are clean and above reproach should be permitted to engage in this business.

Still more contrary, in the minds of those who have studied the activities of the liquor interests from the outside, to the actual attitude of the brewers and the whole trade in the political arena is the following resolution concerning the legal control and restriction of the traffic:

That any urban community, large or small, should have the right, properly controlled by the state, to limit the number, or by a vote of a really substantial majority of its citizens to prohibit entirely, the establishment of public drinking places in its midst; provided, however, that where public drinking places have been already established their owners shall be compensated for the loss entailed upon them by such limitation or prohibition.

UNITARIANS ADOPT AN ADVANCED PLATFORM

The National Conference of Unitarian Churches, in session last week at Washington, D. C., adopted resolutions which the militant leaders in the conference feel take a position in advance of the declarations put forward by any other religious body. The resolutions

were prepared and introduced by the Unitarian Fellowship for Social Justice, and adopted unanimously. They follow:

The National Conference of Unitarian and Other Christian Churches stands and believes that the individual churches must stand and work:

For equal rights and complete justice for all men in all stations of life.

For the right of all men to self-maintenance, a right ever to be wisely safeguarded against encroachments of every kind.

For the right of the workers to some protection against the hardships resulting from swift industrial changes.

For the principles of conciliation and arbitration in industrial dissensions and the full consideration of the rights of the public at times of disagreement or industrial warfare.

For the protection of the workers from dangerous machinery, occupational disease, and mining disasters.

For the abolition of child labor and the protection of children from exploitation in industry and from work that is degrading, dwarfing, and morally unwholesome.

For such regulation of the conditions of toil and hours of labor for women as shall safeguard the physical and moral health of the community.

For the suppression of the "sweating system."

For the gradual and reasonable reduction of the hours of labor to the lowest practicable point, and for that degree of leisure for all which is a condition of the highest human life. For a release from employment one day in seven and a wage based not on a seven-day week but on a six-day week.

For a living wage as a minimum in every industry, and for the highest wage that each industry can afford.

For the most equitable division of the products of industry that can ultimately be devised.

For suitable provision for the old age of workers and for those incapacitated by injury in industry.

For the control of the natural resources of the earth in the interests of all the people.

For the gaining of wealth according to the highest ethical standards and the holding of wealth as a social trust.

For the discouragement of the immoderate desire of wealth; and the exaltation of man as the end and standard of industrial activity.

For the abolition of poverty.

For proper housing; for the proper care of dependents and criminals; for pure food and drugs; for wholesome recreation; and for international peace.

For such safeguarding and extension of the institutions of democratic government as will permit and insure the maintenance of the rights of all against encroachment from the special interests of the few.

SPECIALISTS ON SEX HYGIENE AND HABITS

The first quarterly meeting for the season 1911-12 of the American Society of Sanitary and Moral Prophylaxis was held in October in conjunction with the New York Association of Biology Teachers. The subject under discussion was the teaching of sex in school and college. G. Stanley Hall, president of Clark University, whose treatise on adolescence was epoch-making in the field of child study, read the opening paper. He described this age as a veritable renaissance in respect to the subject of sex, the almost universal recognition that the subject ought to be taught to the young being based on a better knowledge than ever before of sex psychology, of the prevalence of sex error, and of the extent of sexual diseases. He urged that the teaching of sex hygiene should begin at the earliest possible moment, as keeping a child between six and twelve years of age in ignorance often leads either to sexual perversion or to sex shock. Children of this age are alert on the subject and much can be done by judicious suggestions. That the tactless teacher is worse than no teacher at all was the common agreement of Dr. Hall and many of the other speakers, but they were of the opinion that to leave all such teaching till the high school was reached was to leave it till too late. In secondary as well as in high schools bad sex habits are widely prevalent, frequently without the knowledge of the teachers. This fact was further brought out by the Rev. Josiah Strong, in his report of an investigation of schools carried on by the American Institute of Social Service.

In the high school, Dr. Hall held, teaching should be systematic and should be related to biology, supplemented by psychology, physiology, and special teaching on sex diseases. Probably the greater part of this teaching should be given through leaflets. Dr. Hall urged, as one of the first steps in this movement to safeguard youth, the formation of a committee of experts on the subject, drawn from physicians, social workers, and representatives of the churches, to bring about the publication of literature

suitable for school use. The discussion of this point was fresh evidence of the opportuneness of the organization of the American Federation for Sex Hygiene announced in *THE SURVEY* last month. The need for such literature was illustrated later in the discussion by the statement of Benjamin Gruenberg of the Commercial High School, Brooklyn, that the high schools are flooded with leaflets by quacks, filled with misinformation, and designed to terrify young men into thinking they are diseased and into buying patent medicines.

The third stage of sex teaching should be, Dr. Hall believed, in the college, and this is, in his opinion, the hardest of the three, because of the "know-it-all" attitude of the college student. The percentage of college students having venereal disease, he said, is very high. In no single respect do colleges differ from each other so greatly as in the question of sex morality, some being high, some very low in the scale, and this, as in the lower schools—often without the knowledge of their faculties. The center of college teaching on questions of sex should be the biology course, but this by itself is not enough. Healthful athletics should be used to develop the normally puny body of the college student and to give him physical stimuli other than sex instinct. But the most important part of the teaching of college boys should be to fill their minds with ambition to do good work, as the attitude that considers the bare passing mark the mark for a "gentleman" is a signal of precocious senescence, which is, in most cases, accompanied by sexual perversion. Social, even more than religious, interests—because the former especially imply a sense of responsibility for the condition of fellow men—and the development of conscience, in contradistinction to the old threadbare idea of "honor," should be the final influences that should develop sex responsibility in the college student.

In the discussion that followed Dr. Hall's address Dr. Gruenberg dwelt on this developing of the sense of honor as the essential element in sex education. He alone among the speakers said that a most important, perhaps the chief, ap-

peal to this honor should be made by arousing horror and pity for the condition of the prostitute.

Prof. W. A. Bigelow of Teachers' College, Abbie Sage of the Washington Irving High School, Frederick Holtz, president of the New York Association of Biology Teachers, and J. E. Peabody told of their practical experience in teaching sex hygiene to young students through biology. Dr. Ira Wile narrated his experience in teaching mothers, whose education in the matter is, he held, the prime essential, because after all infinitely more can be done for the child's education in the home than in the school.

SEATTLE AND THE NORTHWEST

With true western disregard for distances, delegates from four states assembled in Seattle October 17-21, as the first Northwestern Conference of Charities and Correction. And with characteristic western disregard of new wine for old bottles, they did at the very outset what insurgent members of various eastern city, state, and national organizations have talked about, but never accomplished—changed the name of their organization. It is now the Social Service Conference of the Pacific Northwest. This conference will cover Idaho, Montana, Oregon, Washington, and the Province of British Columbia. Each of these sections will have its own district secretary. The spirit of prevention and up-and-doingness with which these new commonwealths, some of which have been leaders in the radical political reforms of the day, are being urged to address themselves to the range of social problems now first attracting organized attention in their towns and cities, was shown at the outset of the conference, for the three topics discussed at the opening meeting were

Provision for the Social Future.

Forestalling the Slums.

Forestalling Criminals and Degenerates.

How serious a responsibility for social statesmanship rests upon the leaders in this group of states is interpreted on another page by Francis H. McLean,

secretary of the National Association for Organizing Charity, who is on a tour of the Pacific states as his first field work under that new propagandist body.

Conference week was made the occasion for the annual meeting of the Seattle Charity Organization Society, which in its annual report brought out the immediate conditions which the philanthropic agencies of the city are facing. One problem characteristic of the growing western city is that of homeless men. Chicago, St. Louis, Omaha, Denver—each have known it in acute forms. The vagrancy problem, the natural outgrowth of this shifting body of men seeking work and opportunity, is growing in Seattle.

A variety of causes, says the report, have fed this growth: the city's position as a sea-port; its proximity to Alaska; the annual closing down of the logging camps; the shutting of the lumber mills; the return of men from railroad construction camps. A "homeless-man committee" has been formed by the society and progress has been made toward securing a municipal lodging house, co-operation by the city council with other city and state governments to secure uniform city and state vagrancy laws, and the establishment of a state farm colony. The number of applications for help handled annually by the Seattle society has grown in five years from 469 to 2220. In earlier years homeless men constituted a fourth of these; the past year nearly three-fourths, or 1616, were homeless men. Eighty-six of these applied on the day of their arrival in the city. Of the 1011 who were recorded, only 189 had lived in Seattle over six months. In former years the majority of male applicants were sick, crippled, old. Today the able-bodied man predominates. Of 820 applicants whose age and physical condition were recorded last year, 525 were sound in body and 698 were under thirty-five years of age. Eighty-eight were between fifteen and twenty, and 265 between twenty and twenty-five. The United States was given as fatherland by 503, England by 111, Germany by sixty-six, Canada by forty-five, Scotland by forty-three, Sweden by forty, and Ireland by fifteen.

FLORIDA'S FIRST STATE CONFERENCE

Up from the South comes new evidence of strengthening interest in social movements,—Florida will hold her first State Conference of Charities and Correction in Jacksonville, November 16-19. Thus one more is added to the growing list of southern states whose social workers gather annually in conference; yet the number of those who have no such meetings is still large. Of nineteen states which held state conferences in 1900, four were southern—Delaware, Maryland, Missouri, and Virginia; the conferences of the last two were new in that year. Maryland revived her conference in 1907 after seven years of inactivity. Alabama held her first conference in 1909. Kentucky has a conference, and Texas held her first state meeting last spring. South Carolina will hold a conference this year at Columbia, November 23-24.

Clippings from newspapers throughout Florida indicate the efforts making to enlist public interest. Marcus C. Fagg, state superintendent of the Children's Home Society, is chairman of the executive committee, and V. R. Manning, general secretary of the Associated Charities of Jacksonville, is secretary. The issues to be discussed are live ones in the south. One is the drafting of a child labor bill and the appointment of a steering committee to see it through the next legislature. State provision for mental and physical defectives is another.

The Maryland conference at Baltimore, November 27-29, will be held in three sections: health and sanitation, state, county, and municipal work; children, families, and neighborhoods.

WISCONSIN CONFERENCE OF CHARITIES REVIVED

Not a first conference, but the first conference in seventeen years, brought the social workers of Wisconsin together last month in Milwaukee. The last meeting of the State Conference of Charities and Correction had been in 1894; for while the body lapsed, Wisconsin had been among the first states to organize such a gathering, and one of the leaders of the older generation, the late Andrew E. Elmore, was, to use Dr.

Wines's phrase, the "father" of the present national body of the same name. The movement for such another mustering of the social forces of the state was crystallized by the Institute of Municipal and Social Service held in Milwaukee last year.

There was conscious effort to confine the three day's program to subjects requiring immediate attention in Wisconsin. Thus the treatment of law-breakers occupied large attention. Orlando F. Lewis, secretary of the Prison Association of New York, recommended the establishment of a farm colony for tramps and vagrants, and the formation of a prison association to inspect correctional institutions, visit prisoners, reinforce the hands of progressive prison officials, and aid discharged prisoners. The need for a larger force of efficient parole officers was put by G. W. Bowron, superintendent of Green Bay State Reformatory.

That Wisconsin has no place for women offenders except county jails, houses of correction, and the state prison was pointed out by Katherine L. Van Wyck, general secretary of the Central Council of Philanthropies of Milwaukee. There is one industrial school for girls under eighteen. Many of the more than 1,000 girls who have been arrested in the state since January 1, 1911, were allowed to go free, said Mrs. Van Wyck, because of the inadequacy of reformative agencies.

Similarly there was discussion of the needs of the state in respect to its institutions for defectives. At two joint sessions with the Wisconsin Anti-Tuberculosis Association the same general point of view: What are the needs of the state today?—came to the front.

RIISING MORAL TONE OF LABOR BODIES

Reporting, from within, the recent convention of the Illinois State Federation of Labor, a keen observer and critical friend of trade unionism, himself a loyal unionist, publicly affirms:

What appeared to me to be the most significant thing was the decided improvement in the moral tone of the convention.

He admits that

There are a few who will sneer at this

statement, but the number is much smaller than it would have been ten years ago had a similar statement been made then. . . . Extremely sensitive men may still feel hurt by the plain, bald statement of fact that as the labor movement in America is growing in numbers it is also growing in decency and respect for itself.

But as he thinks no progress is made by concealing the truth or drawing the veil over unsightly spots, he proceeds to make confessions which compliment the present at the expense of the past. Not long ago, he makes bold to affirm,

delegates attended these conventions to have a good time, or, what was equally bad, to play cheap partisan politics. Resentment and reaction followed disgraceful scenes which resulted after one of the conventions a few years ago adjourned to visit a brewery. A change in the rules was then made doing away with all entertainments during the business hours. One reason for the low level of previous conventions is alleged to have been the seating of petty appointive office-holders as delegates to such an extent that the real representatives of labor were conspicuous by their absence. At the last convention not a single political appointee of that kind was seated. When the business dragged, as it inevitably does in such a large and varying body of men, delegates from the floor vigorously protested that "the men at home have too little money to keep their representatives here unless they are on the job every minute that the convention is in session."

A visitor from a great fraternity convention which was in session at the same time and place was so impressed with the dignity and ability with which the business and discussions were conducted that he drew the somewhat invidious comparison, "This is a real convention, compared with the kindergarten play which we are conducting."

The demands for remedial legislation made by the Illinois federation at this convention were more radical and insistent than ever. They aimed indeed at two somewhat distant ends, but recognized this fact in avowedly starting long campaigns of agitation and education. One is directed toward securing uniformity of legislation by getting the labor federations of the middle western states to agree upon uniform demands. The other is to unite them in an effort to enact a minimum wage law. The resolution with which the convention went on rec-

ord for the first time in declaring this policy was based upon the facts and figures cited in the report of the Chicago Vice Commission to prove that low wages paid to women workers is a prolific source of vice and prostitution.

Radical as were these recommendations along constructive lines, the tone of the convention was conservative with respect to certain beligerent proposals. Attacks upon the new Illinois compensation act were met by a discussion of the law which suggested the need for studying the subject further before demanding additional legislation. A resolution advising the call of a general strike of all the employes on the Illinois Central Railway to support the striking shopmen was unfavorably reported by the business committee, and a substitute motion was passed by an overwhelming majority to the effect that the convention could only extend such moral and financial support to the men now on strike as the constitution of the federation allowed.

CHARITIES CENTER FOR PHILADELPHIA

The managers of seven social service agencies in Philadelphia have given substantial evidence of their belief in close cooperation as against commodious offices by moving into rather crowded quarters in order to be together. No United Charities building has yet been given them, but the power of an idea has led the Society for Organizing Charity, the Children's Aid Society, the Seybert Institution for Children, and the Children's Bureau to move into quarters immediately adjoining the home of the Society for the Prevention of Cruelty to Children—on South Fifteenth street—to cut communicating doors through four adjoining dwellings, to establish a reception office in common, and to provide quarters also for the Training School for Social Work and for the registration bureau which indexes the work of social agencies.

With this demonstration of team play before the public, the movement for a charities office building, with ample conveniences and space for many more agencies, is likely to gain new impetus.

EDITORIAL GRIST

RED STAINS ON TWO STATE SEALS

OWEN R. LOVEJOY

Two children—only a few years out of babyhood—are dead because the child labor laws of the two American states where they were killed are criminally weak and inadequate.

One was a boy, the other a girl. The boy was killed four years ago, at Rocky Mount, N. C.; but the Supreme Court of the state has just decided by a vote of three to two how it happened. This child, eleven years old, was employed by the Atlantic Coast Line Railroad as messenger for the train dispatcher, and his duty compelled him frequently to cross the yards occupied by about twenty railroad tracks. On Sunday morning, April 28, he was found dead on one of the tracks, with his leg cut off. No one was present to witness the tragedy, and no word ever came from the lips of the child to complain against his lot.

The family sued the company for damages, but the company contended that there was no evidence of their negligence, and that even if the employment of the child was evidence of negligence, there was no evidence that he was on duty at the time of his death.

In the lower court the case was dismissed by the judge, and it was appealed by the family to the supreme court. In the opinion of the majority of the supreme court it is stated that although the law of North Carolina forbids the employment of any child under twelve years of age "in any factory or manufacturing establishment" the railroad company was neither a factory nor a manufacturing establishment; that the question as to whether there was any violation of the child labor law was not pertinent to the case; and that the recovery of damages could not be permitted, as the court was not at liberty to

include employments not within the letter or spirit of the law!

The learned judges evidently felt the pressure of their human interest, for they state that "we may have pity and be inclined to heed the sob of the child in its helplessness, but we must support the law as we understand it." The court points to the fact that no witness swore that the child was killed on the day mentioned, although this was evidently the case; that no witness swore that a train killed the child, although they accepted that as proven; that no witness appeared to show that the child was on duty for the defendant at the time of his death.

Doubtless this is good law so long as legal precedents stand higher than the common knowledge of mankind in the opinion of judges; but we are encouraged to believe that as the sense of social responsibility develops, an increasing number of these eminent interpreters of the law will voice the principles expressed by Chief Justice Walter Clark of North Carolina, who with Justice Hoke vigorously dissented from the quibbles of the bench in this case. Said he in part:

The intestate was a child, small for his age, which was less than twelve years, and had not taken off knee pants. He was employed at South Rocky Mount to carry messages across a yard filled with eighteen or twenty tracks, with engines and trains moving backwards and forwards every few minutes. Such duty would have taxed the discretion and judgment of a much maturer person. The defendant did not attempt to show that he had given the child any caution or instructions whatever.

The Chief Justice acknowledges that there was no eye-witness to prove that the child was killed by a passing train, but says:

The little child being found dead with his leg cut off among constantly shifting trains creates as strong a presumption that his leg was cut off by one of these trains as when a soldier is found dead on a battlefield with a bullet through his head, that he was killed by the enemy.

To the contention of the railroad company that no evidence was adduced to prove that the boy was on duty, Justice Clark replies that the very nature of his work as an assistant to a train dispatcher

is conclusive that it was carried on every day. There is no evidence whatever that these messages were not required to be sent on Sunday as well as on other days.

He continued:

If for any reason he was not at work at that spot on that day it was the duty of the defense to show it, and it could readily have done so, if such was the fact. It did not attempt to make such proof.....

By the avarice of the defendant [the little sufferer] was sent to his death by exposure to an accumulation of perils greater to him in his unguarded and unwarned innocence than that which met the charging column of brave men on Cemetery Ridge. Many soldiers lived through the war. The child was killed on the fourth day of his service.

Without presuming to judge between these learned jurists, we venture that many American citizens will heartily thank Chief Justice Clark for uttering from the supreme bench of North Carolina the same principles in the same striking manner in which any fair-minded citizen would unofficially utter them in the same circumstances.

The second case is that of a little girl, Martha Frazier, who died last week in Utica, Miss. This has not yet come before the courts and perhaps will not. We understand that she was employed by her own parents as a lion tamer in a travelling circus. She was twelve years of age, and had attained some distinction in her ability to put lions and other wild animals through their interesting exhibition. On Saturday, October 21, as the performance was closing, she attempted to make the largest male lion roll on his back and put his feet together. She gave the signal, but the lion did not respond. She prodded him with a stick, whereupon the beast sprang directly upon her, and tore her body until he was shot dead by an employe and "a big Mississippi farmer." Pleading that she might return to her work "before the other lions get bad," she was taken by her father to the sanitarium in Jackson, Miss., where she died the following day.

The little girl loved her work, as the little railroad messenger loved his. Their very dangers appealed to the childish mind. But the stain of murder cannot

be effaced from the seals of North Carolina and Mississippi except by speedy and comprehensive legislation which shall close the doors of such "industrial opportunity" against these little ones. In the case of Martha Frazier, the stain of blood reaches farther than the bounds of Mississippi, and brings further evidence of our thrifty American enterprise which delights in conducting an interstate commerce in children. For the home of Martha Frazier was in Pennsylvania. It was only by chance that her blood was spilled in Mississippi and not in her native state, for there also work on the vaudeville stage, or in a menagerie, or in a large number of other occupations with the consent of the parents is beyond the scope of the child labor law. The little body of Martha Frazier might have been thrown to the lions in Pennsylvania as well as in Mississippi, without the violation of any law.

OPPORTUNITY AND THE NORTHWEST

FRANCIS H. McLEAN

General Secretary National Association of Societies for Organizing Charity

TO THE GREAT PACIFIC NORTHWEST:—The opportunity is here to put your house in order, and to forestall as far as possible the added social problems which will come with the opening of the Panama canal.

—Such was the great message which the Northwestern Conference of Charities and Correction, held in Seattle, October 19-21, gave to the states of Oregon, Washington, Idaho, Montana, and to British Columbia. The idea of a sectional conference in place of state conferences was first suggested by L. H. Wier, field secretary of the Playground and Recreation Association of America. It seemed worth trying. And while the publicity campaign was necessarily small, on account of the limited time allowed for preparation, there was quite a fair representation, though not a large one, from the states mentioned and from British Columbia. At the conclusion of the conference it was decided to name the

organization the Social Service Conference of the Pacific Northwest, and to meet next year.

The timeliness of the message was emphasized again and again. When the Panama canal is opened in 1915, this great northwest will begin to receive steamer-loads of immigrants direct from European ports. Upon the industrial side, men in every business are already figuring just what the stupendous results are going to be in their particular fields. It means a tremendous increase in manufacturing, and increasing markets in the orient and along the Atlantic coast. In fact, the forthcoming transformation of the whole coast may not be otherwise described than as signifying complete revolution, industrially and socially.

On the other hand, the Pacific Northwest is not doing the social tasks it has on hand now. There have been some pretty good developments here and there in recreation, in work for children, in conserving public health, in the field of child labor; but taking the sum total of this there is no doubt that from the care of the neglected family in its home to every single one of the so-called preventive fields, and through to the institutional care and the advanced treatment of types of deficiency, the great tasks are still ahead. If the Panama canal were opened to-morrow, the problems of these sturdy north-western cities, in their glorious environment, would in a few years resemble those of the most neglected Atlantic seaboard cities. There are notable exceptions, of course; but taking the section in the large, this is true. Even when good and conscientious work is being done it is not being adequately supported.

During the conference it was the writer's privilege, with others, to confer with over a hundred business men of Seattle, at a lunch at the Rainier Club, and to learn just how the appeal would be received to add to their great civic plans, which are the marvel of other cities, the gravely important social work. The acceptance was hearty and spontaneous, and it opens up a most promis-

ing development; for the north-western conference feels that Seattle is the strategic point. Why? Because it is the largest city. Also because, while its citizens are cleaning house, they want the very best advice and counsel, and in order to get the most of it and get it in time, they are already girding on their armor to bring the National Conference of Charities and Correction to Seattle in 1913, two years before the opening of the canal. But those who are now interested require the support of the business men of Seattle as a whole in advance of the conference; and with the right kind of leadership during the next two years the interest already aroused should be fanned into the flame of conviction.

It would seem as if this were the great opportunity of a generation, with all the hindsight of other cities now available for the Northwest. Recognizing no universal panaceas, carrying out a program of strengthening the curative agencies and giving them and other agencies the opportunity to work together in the preparation of community programs, diminishing the unfortunate excess of individualism in the social field by definitely working through associative bodies such as central councils—these are the general principles upon which the Pacific Northwest will come to the social workers of the whole country for their very best thought in the development of a practical scheme of action before the canal opens. It would seem as if the desire of Seattle to have the national conference were based upon the possibilities of a great opportunity.

A visit paid later to Portland, Ore., as the guest of the Associated Charities and other organizations, revealed again a slowly dawning desire to be thorough, to be comprehensive, to forestall, to work together through a federated body, and a deeply stirring enmity against the individualism in the social field which has permitted everyone to do as he pleased. In other words, the Pacific Northwest is slowly awakening to its opportunities, which are greater than have ever been afforded any other part of the country within a score of years.

TAKING ACCOUNT OF STOCK.

These cubes, displayed at the Budget Exhibit, showed what New York paid for different services.

NEARING THE \$200,000 CITY

JAMES P. HEATON

New York faces with some apprehension an increase of about twelve cents on the hundred in the tax rate for 1912. After weeks of consideration the Board of Estimate and Apportionment has passed the appropriations for next year and the throes of the annual budget campaign are nearly over. The sum mounts up to \$189,210,950.33, which means a tax rate of about \$1.85 per \$100 on property assessed at perhaps 90 per cent of its marketable value.

The aldermen, subject to the veto of the mayor, can reduce the budget, but they cannot increase appropriations, and with one exception probably no change will be made. That change will not be in the interest of economy or effective public service, but against it. The city fathers in 1910 voted down using \$135,000 for investigating the departments of Education, Health, and Charities. The majority leader of the board has already given out that the aldermen this year will cut out a similar item of \$200,000 to pay the expenses of the committee of the Board of Estimate now investigating the Board of Education, the Department of Charities, and the standardization of grades and salaries in all branches of the city service. The mayor

has expressly reserved the right to act in accordance with his best judgment in case the Board of Aldermen makes any reductions. Last year he did not veto the cuts of the aldermen.

That the city government plays the most important part in plans for social betterment may be little imagined by most people, but it is increasingly recognized by organizations interested in special phases of social work, which are constantly urging the city to assume new obligations. So long as there are unsupervised cases of tuberculosis in the tenements; dark, windowless, interior bedrooms; sick and helpless patients in city institutions who are subjected to the mercies of incompetent employes; babies needlessly sacrificed through lack of proper care: so long social workers cannot watch with equanimity the passing of a budget which does not amply meet the requirements for a successful fight against these ancient evils. Even on economic grounds the human waste transcends the outlay demanded of the tax-payers to control it.

Last year nation-wide attention was attracted by the administration (and by that is meant the controlling group in the semi-executive, semi-legislative Board of Estimate and Apportionment) when it inaugurated in the municipal budget exhibit a policy of refreshing official frankness regarding expenditures. Profiting by its experience,

WHAT TAXES GO FOR.

The cubes in this picture represented the different departmental appropriations for 1910.

the administration did not this year attempt the impossible. That the budget was bound to grow, unless the growing needs of the departments were disregarded, was recognized; but the increase of nearly \$15,250,000, under which the city winces, as against an increase of approximately \$11,000,000 the year before, is not in large part due to this policy of constructive expansion on the part of the mayor and his colleagues, which on the whole has won approval. Rather more than \$8,000,000 of this increment represents what New York city is to pay as its share of the revived direct state tax and the cost of "equal pay" in the schools. At almost the last moment Governor Dix signed the measure for which women teachers have so long struggled; and undoubtedly it is this feature of the budget which will attract the most attention throughout the country. Another million of the increase is due to debt service, which now amounts to over \$51,750,000. For a second time \$10,000,000 has been set aside to make good accumulated deficiencies in taxes. Much of the remainder of the \$15,250,000 represents mandatory increases in salaries for policemen and firemen and for newly created officials.

Some of the causes which make the budget larger than it need be have been pointed out year after year. The issue of special revenue bonds is a question that needs more attention. Unforeseen

needs will always arise, but it is poor policy to set aside in the budget purely nominal sums for snow removal. The cost of this service cannot be foreseen, but it is at least possible to fix a sum below which it is unlikely to fall, so that special revenue bonds would have to be issued for the excess over this amount only. New York has continued also to lose money by borrowing to meet current bills, because taxes are collected nearly a year after the city spends them. Hereafter this will be partially corrected by the new law for semi-annual payment of taxes.

Although the budget exhibit was attended by about 1,000,000 people, the general interest in the budget itself was probably not as great as a year ago. Less than twenty-five citizens were present at the first of the two public hearings and at this meeting almost the only discussion directly on the budget itself was devoted to a protest by real estate interests against any increase for the Tenement House Department. At the second hearing, which was on the tentative budget, the interest was largely centered upon the plea made by citizens for seventy-one municipal infant milk stations. This was almost the only subject that received adequate attention in the newspapers, which did not at all conspicuously even announce the hearings. There is some excuse for the failure of citizens to attend. A number of im-

portant departmental estimates did not appear in the City Record until October 27, the very day set for the hearing on the tentative budget—only five days before the budget was to be adopted and actually after the date of the hearing on the departmental estimates. At the time this is written the newspapers have not yet printed a tabulated statement showing the appropriations made to each department, and some of the departments do not yet know exactly what has been finally allotted to them.

Aside from the provision for equal salaries for men and women teachers, the most important phase of the appropriation for the Department of Education is the fact that it was adopted largely in accordance with the advice of the committee investigating the school system. The schools received an increase of rather more than \$1,000,000 for purposes other than the equalization of salaries. To meet the increase in general enrollment and to reduce the size of classes provision is made for some 500 new teachers. Increased provision is made for ungraded classes and for special classes for anaemics, blind, deaf, and crippled children, and for vocational schools. There is, however, to be no increase in the work of the vacation school system.

The Department of Health, with an appropriation of nearly \$3,175,000, receives an increase of a little over \$340,000. A considerable part of this is for equipping and maintaining fifty-five municipal milk stations. The commissioner of health asked for seventy-three and it was demonstrated by studies showing the radius of influence of milk stations that at least seventy-one were needed to provide one within reasonable walking distance of all the mothers in the poorer districts. Since the budget was passed the city has assumed charge of twenty-two of the depots of the New York Milk Committee. With the fifteen it already had the municipality is now conducting thirty-seven stations. At the twenty-two fully equipped stations presented by the New York Milk Committee rent-free until January 1, there are now no nurses in charge. This lack must detract considerably from the ef-

fectiveness of the work, so that it is surprising that the Department of Health has not yet accepted the offer of the nurses who worked at these stations till November 1 to serve temporarily free of compensation till other arrangements can be made.

At the last moment, after the governor had signed the bill increasing the pay of women teachers, the board of estimate in an effort to keep total city expenses below \$190,000,000 cut the budget of the Department of Health by \$194,000. Among the branches of the work which suffered in consequence were the Department of Child Hygiene, the plans for the extension of the Otisville Sanatorium, and the plans for research work. Borough President McAneny in voting for the budget announced, that he did not approve of these reductions.

The Department of Charities received an increase so small that the plan urged for several years of raising the pay of all hospital helpers to a minimum of at least \$20 a month cannot be carried out. At present many receive but \$15 or even less, and during the past year the department has reduced the pay of many employes receiving less than \$20 a month. As illustration of the wasteful effect of such enforced economies in municipal service, it is to be noted that this department has hired, it is reported, 8,853 individuals to keep 1,150 places filled. The average man therefore served but two months. Often hospital helpers do the work of nurses and are paid, making due allowance for maintenance, \$300 a year less than street-sweepers! The beggarly pay of the lower grade of the hospital service has been a recognized disgrace to New York for years and a cause of neglect to its patients.

The Department of Corrections, Bellevue and Allied Hospitals, and Charitable Institutions received small increases. The Tenement House Department, charged though it is with the supervision of 103,000 tenements which house 3,500,000 people, has again been singled out for a decrease, and despite its creditable showing. In the last two years 44,000 living rooms without windows

have been made light. Parks and hospitals are useless if the homes of the people are left subject to the greed of landlords or the ignorance of tenants. The commissioner has never been able with his insufficient staff to make the monthly inspection of tenement houses a requirement of law.

Among the needs, recognized by social workers, that have not yet been met are a municipal year-book, a well organized municipal library, and a permanent museum of municipal problems and methods. Perhaps the social service departments were fortunate to receive as generous treatment as they did, but it is questionable whether, after the estimates for these branches of service had been cut to the very bone, it was wise to reduce them still further in an effort to make up the sum added to the school budget by the equal salary measure. It was such vital service as that planned in child hygiene and in the extension of the meagre hospital equipment for consumptives which were sacrificed in this eleventh-hour pruning. The needs of the city in the way of health, charities, and education have not been adequately met. The departments will be able to carry on their present work, but almost all their constructive plans are held up for twelve months.

COMMUNICATIONS

"WANTED: A CHILD TO ADOPT"

STERILIZE THE UNFIT

TO THE EDITOR:

I have read with great interest in your issue of October 14 the valuable article by Henry H. Goddard, entitled *Wanted: a Child to Adopt*. Mr. Goddard deals with a very vital question, and his picture of threatened dangers to communities through intermarriage with persons who were adopted as children from institutions is not overdrawn.

Undoubtedly there are children occasionally to be found for adoption in institutions whose birth and lineage would be unshadowed by any taint, but common sense, as well as the testimony of those who have had the widest experience, show us that such cases are exceedingly rare. As Mr. Goddard so ably

points out, children who are held for adoption in institutions, and elsewhere as well, are almost without exception derived from inefficient, if not from diseased, feeble-minded, or criminal stock, and to place them unguarded in our American homes is to run the risk of their marrying later some unsuspecting member of the better class among whom they live, and breeding children who will inherit the degenerate traits of their ancestry. Of course, it will be urged that the lineage of any child, as far as it is known, should be fully made known to any family wishing to adopt that child; but all warning might prove useless, after a lapse of years, to the younger generation, and this precaution would in the long run undoubtedly be altogether inadequate to prevent the evil.

The suggestion that such a class of children be colonized at the state's expense if need be leads to the question as to the future development of such a colony; intermarriage among its members would of course take place, but what conditions would develop, physically and morally, in the course of a few generations bred from such ancestry? Imagination recoils from the picture.

Dr. Woods Hutchinson in his brilliant article, *Human Misfits*, in the October *Everybody's*, seems to me to strike the right note and to suggest the only radical cure for this great evil of degeneracy. To quote from him:

"Broadly considered, these individuals ought never to have been allowed to happen—but having happened, what then? Isolation, and such humane restraint as will protect society from their anti-social acts, is of course obvious, but society owes a still further duty to itself and to future generations. It would be a little short of criminal, from a biological point of view, to permit even the remotest possibility of their causing other failures like themselves to appear in the next generation. Those of them whose defects are so gross as to require their constant confinement are of course by that fact prevented from reproducing their kind; but the other and larger class, who are under favorable circumstances partly or completely self-supporting, cannot be so dealt with. For these, the only effective and intelligent treatment is sterilization."

How great would be the boon to the present generation, and how incalculable the benefit to all future generations, if all children in the class above referred to could be by this simple means so treated that reproduction would be impossible! The science of eugenics is in its infancy; but in it surely lies a great hope for the future of our race, if only we heed its warning and guiding voice. Already several states have passed laws requiring a certain class of criminals to undergo vasectomy, and other states, it is to be earnestly hoped, will soon follow their enlightened example. A simple operation of this sort would be doubtless even more easily performed in childhood than in adult life, and if

ever an ounce of prevention is worth a pound of cure, it would seem to be so in this case.

MARY A. FARRINGTON.

West Roxbury, Mass.

MAJORITY NOT DEGENERATE

TO THE EDITOR:

By calling attention through his article, *Wanted: A Child to Adopt*, in *THE SURVEY* for October 14, to the need for a thorough investigation and recording of the antecedents of dependent children, Dr. Henry H. Goddard has performed a distinct service to child-helping work. His recommendation is in line with the present practice of the best agencies. Those who are foremost in the work employ trained investigators who make a complete inquiry into the personal and family history of each child for whom care is sought. Defectives are sifted out and given institution care, so that only the sound and hopeful cases are left for placing out. The practice, wherever it exists, of placing out children of doubtful mentality or of known deficiency cannot be too strongly condemned. By emphasizing the danger of this, Dr. Goddard has earned the thanks of all who are striving for the best ideals in child-saving.

There is a portion of the article that is regretted by friends of home-finding, however. I refer to the first part, where the impression is given that a large proportion, the greater number, in fact, of placed-out children are by heredity degenerates. This view overlooks the numerous children who come into the dependent class through some one of the many factors grouped as social mal-adjustment. But on this point the home-finding societies can speak for themselves. I wish merely to cite as bearing on the question the data gathered by the Children's Village of the Seybert Institution in regard to the mentality and heredity of the children whom it has cared for.

The work of this institution is to provide temporary care and training for dependent children of Philadelphia, preparatory to placing them in family homes. Children are received from the Juvenile Court, through the Children's Aid Society, the Society to Protect Children from Cruelty, and other organizations. No child is received if some other agency is open to it. Hence the village population largely represents the left-overs, whose cases present some other feature than mere temporary care, such as training, physical up-building, or observation of mentality. The best class of dependent children, those who are attractive and immediately placeable, are not received.

How, then, does this rather ill-favored group of dependent children appear when studied as to degeneracy? The most complete data we have is in regard to those who have entered since January 1, 1910, when the Binet tests, championed in this country by the Vineland Training School, were adopted. There are 134 children who have been examined in this way.

Of these, five tested above normal, eighty exactly at normal, twenty-four backward one year, twelve backward two years, eight backward three years, four backward four years, and one backward six years. Now the surprising thing about these results when reduced to percentages is that they tally almost exactly with the results secured by the Vineland research department in its examination of 2000 public school children with the Binet tests. They found that 15 per cent of the public school children tested from two to three years backward. At Meadowbrook the percentage this group makes is 14.9. Children who test only one year backward are considered as practically normal. The percentage of feeble-minded among the public school children (those who test from four to six or seven years backward) was 3; the similar group at the children's village formed 2.6 per cent. The agreement with the showing made by an ordinary public school system is, to say the least, remarkable.

Now as to the mentality of the members of this group who were placed out. There were twenty-two of the 134 who were thus disposed of. One of these was above normal, eighteen were normal, and three were backward one year. Hence all were normal children if judged by the standard set forth by Dr. Goddard in the article, in the *Training School* for January, 1911, entitled, *Two Thousand Normal Children Tested by the Binet Scale*.

What light is thrown on the heredity of these children by our records? The family history of eighty-four out of the 134 is negative as to feeble-mindedness or anything associated with it. Six, or 4.4 per cent, have feeble-mindedness at some point or other in the family, near or remote. Twelve show a family history of insanity. One had a syphilitic inheritance. These are the only cases which showed any of the proved concomitants of feeble-mindedness. In three cases it was impossible to find out anything about the family history. In twenty-eight cases drunkenness was a marked feature of the life of one or both parents. This is considered by the Vineland department as a frequent concomitant of feeble-mindedness, but has not yet become generally recognized as such. Certainly drunkenness cannot be considered a transmissible neurosis in all these cases. However, if we admit drunkenness as a taint, there remain 62 per cent, the larger part, of these children who cannot be classed as degenerates. If we exclude all or part of the cases where drunkenness figures from the hereditary degenerates, the percentage of those with sound inheritance becomes much larger.

The impression gained from the figures just quoted as to the mental equipment of these children is further reinforced by a canvass of their school records while here. The school system is so arranged that a child can be promoted in three, six, or nine months, in fact, just about as fast as he can do the work, except for the limitation made by the adjustment of the school work to terms. The grades in so

far as they differ at all are considered more difficult than the similarly named grades in the public schools. Of the 134 children, seventy-two of school age were here six months or more. Their rate of progress was as follows: making a grade in three months, four; in six months, twenty-seven; in nine months, seventeen; in twelve months, sixteen; in fifteen months, six; no progress, two. I have no figures from public schools where the "lock-step" or the rigid insistence on one year to one grade has been abolished with which to compare these, but certainly the rate of progress given here does not indicate a degenerate group.

I recognize that the figures quoted above do not represent enough cases to be conclusive. I offer them now simply as showing a tendency. We will have to accumulate data for thousands of cases before we can consider anything as established. But the tendency is especially striking from its appearing in a group representing the worse rather than the better cases. It would seem to corroborate the view of heredity adopted by Dr. Patten, in his *New Basis of Civilization*, that the factors which affect the germ cells are comparatively few, and that improvement of social conditions will reclaim the greater part of human wreckage.

OSCAR M. SULLIVAN,
Supervisor Care and Education,
Children's Village of the
Seybert Institution.

Meadowbrook, Pa.

MENTAL AVERAGE HIGH

TO THE EDITOR:

The article by Dr. Goddard in *THE SURVEY* of October 14 attracted and amused me—first because I have charge of the placing-out of children, secondly because of the purely academic nature of the discussion and the evident unfamiliarity with the conditions generally obtaining. Taking up the various points as they appear in the article, we will grant for the present that the bulk of the children for whom homes are to be found come from more or less profligate, non-intelligent, and non-self-respecting parentage.

The gift of a calf by a farmer subject to the conditions given is inapplicable to the subject under consideration. Not one farmer in fifty keeps pedigreed stock that would be contaminated by mingling with a "grade" stranger (that might turn out to be more profitable, as frequently happens, than anyone of his blooded cattle) and, I'm sure, not one farmer in, let's say, ten would turn down a chance to add to his herd a healthy, vigorous calf on the conditions given. It should be remembered that at least 75 per cent of the milk daily marketed for public use comes from grade cattle and not from pedigreed stock. It is a well known fact among breeders that a pedigreed individual, to equal or surpass sire or dam, must be developed by an intelligent system of feeding, care, and manipulation. And the broad-minded breeder will also tell you that the same care, feeding, and manipulation given

from early in life will improve "scrub" stock marvelously beyond its forbears—but this fact is not given wide publicity, as it "hurts the business." So it is among the patrons of the placing-out departments of most homes. Forty-nine out of fifty are bragging of what they have *ascended* from—their development—rather than from what they are descended, and are willing to take a chance on feeding and other care turning out a fairly profitable member of the "herd" from a youngster who might under neglect and other circumstances be a more worthless "beast" than its progenitors. Also, 75 per cent of the world's work is done by that ascending class of people rather than by the pedigreed stock; judging from frequent newspaper articles the offspring of the latter class, in the case of both man and beast, is raised with the sole object of bringing the highest price at the "fancy stock auction"!

The "stock" which this home in common with others (outside of institutions for feeble-minded) offers freely to the public comes from ancestry mostly defective in *one* point only and with many good points apart from that; and our mangy, feeble-minded, diseased candidates for public favor are cared for in the colonies as advocated by Dr. Goddard. Then too, this home at least—and probably most placing-out agencies show the same ratio—has at present only two children (out of forty-seven under supervision) in homes where there are other children not yet of legal age of maturity, so that the possibility of marriage of our children with degenerates is more or less of a "bogey." It is true that "disease and mental deficiency and possibly crime are transmitted from parents to children," etc., but it is also true that they are *not* transmitted in just as many instances. If we are to believe our scientists in degeneracy, not five out of every one hundred of our population is free from all the "stigmata of degeneracy," all the rest showing one or more of the signs. Dr. Goddard could probably point to several in his own personality (all men of genius have them in more or less marked degree), and as with them, so it is and, just as long as love and not "science" rules people's lives, will be largely with the adopted child: we will be willing to put up with such defects as are not too serious, if only they can give us in return comfort, joy, inspiration, or even profit. And in many cases the supposed defect and taint has been found to be non-existent.

Speaking from several years of practical experience and observation, while it is true that a small percentage of homeless and neglected children come under the classification of feeble-minded, I think I am safe in saying that a major percentage will average as high mentally or otherwise, *under equally favorable environment*, as so-called "normal" children, and a small percentage will show some little genius along one or more lines. It must be remembered that most of the cases coming under Dr. Goddard's inspection in institutions for feeble-minded are the deeply ingrained and extreme cases and not at all comparable

to the usual destitute child. Nothing could manifest this more clearly than the usual quick response of the latter to the improved conditions, noticed by all placing-out agents—a characteristic noticeably lacking in the actually feeble-minded, to the best of my recollection of several years in work in institutions for feeble-minded. Unfortunately scientific knowledge is far from universal in extent and there are many factors unknown to it working beneficially in the mental life of the race which offset and dispel asserted evils, even as our "bacteria bogie" led us to find years ago. And, to speak briefly, as most of the feeble-mindedness began back in the forbears through long continued, strenuous practice of abnormal habits or exceedingly unfavorable environment, just so the adoption and long-continued practice of opposite habits and of favorable environment helps to eliminate, not merely hold in abeyance, those same characteristics.

I might also add that the progressive homes—I do not know about the agencies—do give as full particulars as are known regarding every child, except names, advise as to the desirability of selected children for that particular family, and keep in touch with them for years.

ERNEST WYKES,

Superintendent Home for the Friendless.

Lockport, N. Y.

WOMAN AND LABOR

TO THE EDITOR:

In my opinion your reviewer, in your issue of September 9, has been far too easy on Olive Schreiner's *Woman and Labor*. This appears to be, indeed, the general attitude toward the book, which may be accounted for in part by the fact that it proceeds with such a rush of vehement utterance that the reader, unless very wary, cannot hold fast and collect himself in the midst of the flood of words, and in part because it favors a good cause.

The excuse made by Mrs. Schreiner and accepted by your reviewer for presenting an obviously one-sided view of woman's relation to labor—that she is reviving only one phase of an originally comprehensive work on *Woman* which had been destroyed—is inadequate, for once occupied with the one phase chosen for revival, she treats it not at all as a part but as the whole.

She lays it down as a general proposition that the development of our modern industrial system has on the one hand been progressively restricting the field of woman's activity by taking work out of the home into the factory, and on the other hand has been making it more and more possible to maintain the now idle woman in a dependent condition as a "parasite." This process has already affected vast masses of women and may in time threaten the entire body, she thinks, and the consequence of this parasitism, according to her views, is not only degeneracy of the individual but decay of the race; and it is an uneasy sense of this danger to the race which

gives the motive to the woman's labor movement, in contrast to the man's labor movement, which is carried on for the sake of increased material prosperity.

Nothing could be more misleading. In the vivid series of pictures with which Mrs. Schreiner illustrates her thesis, she shows only those readjustments of labor by which work is taken from the hands of women in the home. She utterly fails to give the companion picture of the woman following the work out of the home to the factory. She forgets, or perhaps never knew, that the introduction of machinery sometimes actually displaces male labor by female labor, and that certain inventions, as for example the typewriter, have automatically opened the gates of opportunity to more thousands of women than the "conscious resistance" of leisure-class women to tens.

She does not note that even on the level of comparative prosperity (reached by a comparatively small proportion of the community after all) which permits the maintenance of a dependent class of women, a rising standard of living makes it increasingly difficult for the male support of the family to meet the demands on him. At once a strictly economic motive to further exertion is brought into play, felt by the women of the family as well as by the men.

As a matter of plain fact, the mass of women who are to-day striving for wider economic opportunity are not doing so in order to relieve themselves of superfluous energy or through any fantastic notions about "the race," but with the much more sensible and creditable motive of securing, through labor, the means of sustaining themselves and those dependent upon them, in accordance, as nearly as they can manage it, with the standard of decent living established by their community.

This book is, indeed, so vague in statement—for we are not even told in any definite way just what the author means by "parasitism"—and so contradictory, that one cannot be certain of formulating, without fear of refutation from some one or other of her pages, the substance of her doctrine.

But I think the emphasis of treatment shows that the above is a fair presentation of her main idea, and that this idea is a mistaken one. The book is evidently based on exceedingly narrow personal observation, on misunderstood and misapplied economic generalization, and on biological assumptions which it is not fitting for the layman to make.

Why should your reviewer excuse the shortcomings of this book on the ground that the original work was burned up twelve years ago, so that naturally the present work is a little out of date! The matter presented was out of date even at that time; and, in any case, what has Mrs. Schreiner been doing in the last twelve years that she could not learn a little something of modern industrial history?

KATE HOLLADAY CLAGHORN,
Tenement House Department,
City of New York.

New York.

VICE AND WAGES

TO THE EDITOR:

My attention was attracted by the reference in *THE SURVEY* to a lack of any statistics that would show the proportion of department-store workers living at home, this question being discussed in the letter of Joseph D. Holmes criticising the report of the Chicago Vice Commission.

Mr. Holmes states that no statistics are given in that report and adds that perhaps none are to be had, and the commission, according to the editor, acknowledges its lack of statistics. I think the commission must have overlooked the report published by the Census on Women at Work, also the recent report by the Bureau of Labor on Wage-Earning Women in Stores and Factories.

The census report compiles data, taken from the 1900 census schedules, for the women employed in various occupations in twenty-seven of the principal cities of the United States. This tabulation included 65,186 women over fifteen years of age or, using the census phrase, "sixteen years of age and over," who were employed as saleswomen, and of this number 60,062 were single women. Of the single women, 51,693, or 86.1 per cent, were living at home, as was indicated by the fact that they were related to the head of the household in which they lived. This comes pretty near giving a direct answer to the specific question which Mr. Holmes raises, and it indicates that his guess of from 80 to 85 per cent was a very good guess, erring slightly on the side of conservatism.

Of the 51,693 single women returned as living at home, 30,096 were living with father; that is, in a household the head of which was the father of the girl or woman at work; 13,380 with mother; and 7,432 with some other relative.

The census report, moreover, throws some light on the question of the extent to which these women and girls are dependent upon their own earnings for support, for it classifies them with respect to the number of other breadwinners in the family in which they live. Thus it appears that of the 51,693 single women employed as saleswomen and living at home, 13,261 lived in a family in which there was one other breadwinner; 15,605 where there were two other breadwinners; and 20,280 where there were more than two other breadwinners; while 2,547 lived at home in families in which there were no other breadwinners.

It appears, therefore, that about 82 per cent of the single women and girls employed as saleswomen were not entirely dependent upon their own earnings. On the other hand, 2,547, or 4.2 per cent of the total number, apparently had to support not only themselves, but perhaps others dependent upon them, while 8,369, or 13.9 per cent of the total number, were returned as boarding (including perhaps some who lived with their employers) and, presumably, had to support themselves at least from their own earnings.

In the census report this tabulation is presented separately by occupations for each of the twenty-seven selected cities, and the workers at the same time are classified by general nativity into four main classes: namely, native white of native parents, native white born of foreign parents, foreign-born white, and the Negro.

In the city of Chicago the number of single women working as saleswomen was reported as 6,593, and of that number 5,643, or 85.6 per cent, were living at home and 5,399, or 81.9 per cent, in families in which there were other breadwinners.

In Manhattan and Bronx boroughs, New York, the total is 13,208, of whom 11,367, or 86.1 per cent, lived at home, and 10,834, or 82 per cent, in homes where there were other breadwinners.

In Brooklyn borough, New York, were 6,029 saleswomen who were single, 5,471, or 90.7 per cent, of whom lived at home, and 5,192, or 86.1 per cent, with other breadwinners.

Similar comparisons may be made upon the basis of these statistics for other cities for several classes of the population and different occupations. This report may, I think, be commended to the attention of all persons who may have occasion to study the relationship between the wages of women, the cost of living, and the social evil. Copies of the report may be secured upon application to the director of the census, or to the writer.

JOSEPH A. HILL,
Chief Statistician Bureau of the Census,
Department of Commerce and Labor.

Washington, D. C.

BACK TO SOURCES

TO THE EDITOR:

I believe in all the protective and social laws we have passed and are projecting. Housing reforms, child labor laws, compulsory education, injury indemnity, shorter hours for women and minors, and pensions—these are drastic remedies for dread diseases. Our industrial and social system infects and the body politic must disinfect. But is not something else needed? There are causes for all ills, few of them are providential or unavoidable. We had cholera up to the sixties and yellow fever into the eighties. We got rid of both by closing the wells and privies, making sewers and controlling water supply, cleaning the streets and alleys, and airing the tenements. We removed the causes and the thing was done. City congestion and poverty are made up of the stream from the country—domestic and foreign. The cities and the factories are growing fabulously, the farms are in many parts vacant, in no old state are they keeping pace with the total. There are causes for this migration, curable causes. Turn the energy that now goes into relief in the cities or one half of it, into the country to educate for rural life, to organize socially, to introduce cooperative business, and the conditions which now turn the face of the young town-

ward can be changed, country life made attractive as of old, and the migration stopped. There would still be some dependents, but there need be no unemployed, no congestion, no unfit housing. Labor would be at a premium, wages and conditions better. Persuade manufacturers to locate in country towns and make garden cities for factory, homes, and recreation.

I have done both and know them to be workable. With their large planning, charity organizations confess that their work has been only relief and not cure. They should devise plans to tackle the causes at their sources.

St. Louis, Mo.

N. O. NELSON.

JOTTINGS

Philadelphia Child Welfare Conference-Exhibit.—A Philadelphia Child Welfare Planning Conference is announced for November 20 to 20, together with a two-weeks' exhibit of city and private work for children to be displayed at the city hall. Like the Municipal Planning Conference of last spring, the responsibility for it rests on the municipality. The various committees include about two hundred names, Mrs. Frederic Schoff, president of the National Congress of Mothers and Parent-Teacher Associations, being chairman of the executive committee, and the other members being Dr. J. S. Neff, Jacob Gimbel, F. W. Forbes, Mary S. Garrett, Dr. Robert N. Willson, Mrs. George K. Johnson, Mrs. William T. Carter. "This conference-exhibit," writes Mrs. Schoff, "is Philadelphia's study on child welfare; a summing up of what is done, what is lacking, and what may be done to give to every Philadelphia child the best opportunity for physical, mental, and moral development, the municipality itself taking the initiative. Every home, every school, every church, every citizen, every organization, whether of men or women, is asked to cooperate, for the city that wisely cares for its children is the city that will have the greatest future. The rights of the children when regarded and considered will show a decrease of infant mortality, decrease of juvenile crime, decrease of adult criminality, decrease of prisons and hospitals and of asylums."

Austin Dam Disaster.—Prodded perhaps by Governor Tener, the coroner's jury which is charged with investigating the flood at Austin has resumed its hearings.

Labor Committee of United States Steel Corporation.—The stockholders' committee, appointed to investigate labor conditions, as a result of Charles M. Cabot's motion at the annual meeting of the United States Steel Corporation, has been announced by Judge Gary. Stuyvesant Fish, formerly president of the Illinois Central Railroad is chairman, the other members being T. DeWitt Cuyler of Philadelphia, a director of the Atchison, Pennsylvania, and New Haven railroads; Darius

Miller, president of the Chicago, Burlington, and Quincy; Charles L. Taylor, formerly secretary of the Carnegie Steel Co. and chairman of the Carnegie Hero Fund Commission; and Charles A. Painter, banker, of Pittsburgh. See THE SURVEY for July 22.—P. 591.

National Municipal League at Richmond.—With its attention directed to a legion of the problems of city government, the National Municipal League will hold its annual meeting November 13-16 in Richmond, Va., under the presidency of William Dudley Foulke. His annual address on Effective Municipal Government will set forth the results of a study made by him last summer of the actual administration of government in a typical German city. At the morning session of November 14 a statement on City Government by Commission will be read as prepared by a committee consisting of Richard S. Childs, New York, secretary of the Short Ballot Organization, Prof. William B. Munro, assistant professor of Government at Harvard, Clinton Rogers Woodruff, editor *City Government by Commission*, secretary of the League, Prof. Charles A. Beard, Columbia University, and editor of the Digest of Short Ballot Charters, and Dr. Ernest S. Bradford, of Washington, D. C.

This topic looms large on the program. In the afternoon of the fourteenth municipal civil service reform will be discussed by Charles J. Bonaparte, Baltimore, former attorney-general of the United States. Other subjects slated for discussion are The German Imperial Unearned Increment Tax; Housing, Health, and Morals; Civic Surveys, Civic Education, etc.

HELP WANTED

Executive Secretary

An Executive Secretary wanted at The National Farm School. Applicant must have experience in organizing and in propaganda work.

Address, stating salary expected, Dr. Jos. Krauskopf, Pres., 4715 Pulaski Ave., Philadelphia, Pa.

SITUATIONS WANTED

COLLEGE graduate with highest references and experience in social work would like to tutor or read to woman interested in social movements. Two dollars per hour. Answer Tutor, Survey.

For the Home

LESSONS in COOKING Thru Preparation of Meals
New home-study course, 260 menus with recipes and full directions for preparing each meal. Food Economy, Balanced Diet, Menus for all Occasions. Special Articles, etc. Send 50c. for first 21 lessons. Sample pages free.
American School of Home Economics, 519 W. 69th St., Chicago III.

SOCIAL FORCES

BY THE EDITOR

THE DESERTION OF THE STREET CLEANERS

With the incidents and merits of the controversy between Commissioner Edwards and the street cleaners of New York city we shall have occasion to deal later. At this writing the outcome is not clearly discernible. In one aspect, however, it furnishes already a most impressive object lesson and the lesson should be taken to heart. That lesson is that the public service should not be subject, in fact must not be subjected, to strikes, lockouts, and other vicissitudes of the industrial warfare. For the army of street cleaners to throw up their jobs simultaneously in order to enforce their demands should be regarded not as a strike but as desertion, and desertion on the field of battle in the face of the enemy. No one who has walked through the slime of the unswept streets and seen and smelt the uncollected and disintegrating garbage will question the fundamental importance of the street cleaning service and the elementary necessity of keeping it in continuous operation.

The right to strike is not lightly to be denied; but society's right to self-preservation is paramount. That any community should tolerate the possibility of such a wholesale desertion after even a single experience with it is unthinkable. Heretofore we have not taken measures to prevent such a catastrophe, because heretofore policemen, firemen, health inspectors, and street cleaners have not been in the habit of trying to influence their wages, their hours of labor, or the conditions of their employment by such drastic means. Now that we know the danger we must take suitable precautions against it.

We do not suggest that these particular offenders against the public health and order should be dealt with summarily as if they had violated a statute. To twist the law of conspiracy to meet the case would be impracticable and unfair. This particular situation has had to be handled as an unforeseen emergency, and of the methods by which it was handled in its earlier stages perhaps the less said the better. What should be done, however, is to enact a law making it a misdemeanor to strike in any branch of the public service and providing suitable penalties. Such a law might extend also to quasi-public corporations such as railways, express companies, water companies, telegraph and telephone companies. Strikes and lockouts may remain for a time the last resort for settling strictly private disputes, although a little more civilization will surely send them entirely to the scrap-heap of discarded barbarities. In the public service certainly and probably in the public service corporations also the time has already come for decisive action. Under modern conditions the daily food supply is dependent upon uninterrupted railway service, as the public health is immediately dependent upon the uninterrupted cleaning of the streets, and the public safety upon the fidelity of the police force. Such a general railway strike as those which have occurred recently in France, England, and Ireland may take place here at any time, and adequate measures should be taken in advance against

the paralysis of trade and industry, of the primary functions of the life of the community, which such a calamity involves. France called the railway strikers as reservists to the colors. England appointed a parliamentary commission to make a quick investigation, and the government let it be known that by its own direct intervention if necessary the railway service would be kept in operation. These methods are not open to us, and, although in an extreme emergency some device might be found, it is surely more rational to profit by the experience of others and by our own experiences before we are brought to extremities.

The denial of the right to strike implies of course the creation of some adequate means of sifting the grievances and demands of those who are engaged in the public service. If the legislature does not itself desire to fix wages and the conditions of employment some impartial tribunal could be established for the purpose. If men are not allowed to strike they must have their chance to make their appeal elsewhere and their just demands must be met. The machinery for meeting them must be such as commands public confidence and democratic support. An impartial inquiry by some body not amenable to the employer and on the other hand not open to undue influence from the side of the employes must take the place of the trial of strength. After all, how unsatisfactory and inconclusive the strike has shown itself to be as a means of settling disputes! It is scarcely more logical or equitable than the mediaeval trial by water and fire. The result depends often upon many incidental circumstances with which the merits of the case have no connection. Useful in default of something better, even indispensable, in the early stages of a labor movement, the strike is surely not an ideal arbiter, at least between the state and its own employes. When security of employment has once been established, and wages are determined, as they may be at least roughly, with some reference to the cost of living and of maintaining the prevailing standard of life, the strike loses its justification and becomes unnecessary. When we suggest that, in the public service at least, desertion should be definitely forbidden, we recognize that the status of the employe must be additionally safeguarded in these respects. The state under such circumstances deliberately assumes responsibility for the conditions of employment and must provide adequate mechanism for discharging that responsibility fairly and justly.

Let us begin by making strikes in the municipal service both impossible and unnecessary.

THE COMMON WELFARE

TWENTY-FIVE MILLIONS CARNEGIE'S LATEST GIFT

The Carnegie Corporation of New York, chartered last June by the state legislature, and organized on November 10, has been given \$25,000,000 by its founder. It is intended that the business of founding and aiding libraries and educational institutions, which has been carried on by Mr. Carnegie as an individual for many years, will be turned over at an early date and carried on by the corporation. The purposes of the latter, as stated in the act passed by the New York legislature June 9 last, are as follows:

Section 1. Andrew Carnegie, Elihu Root, Henry S. Pritchett, William N. Frew, Robert S. Woodward, Charles L. Taylor, Robert A. Franks, James Bertram, and their successors are hereby constituted a body corporate by the name of the Carnegie Corporation of New York, for the purpose of receiving and maintaining a fund or funds and applying the income thereof to promote the advancement and diffusion of knowledge among the people of the United States, by aiding technical schools, institutions of higher learning, libraries, scientific research, hero funds, useful publications, and by such other agencies and means as shall from time to time be found appropriate therefor.

Five of the incorporators named are the heads of the various great philanthropic trusts hitherto established by Mr. Carnegie, Mr. Root being president of the Carnegie Endowment for International Peace, Dr. Pritchett president of the Carnegie Foundation for the Advancement of Teaching, Mr. Frew president of the board of trustees of the Carnegie Institute of Pittsburgh, Mr. Woodward president of the Carnegie Institution of Washington, and Mr. Taylor president of the Carnegie Hero Fund Commission. Mr. Franks is president of the Home Trust Company and Mr. Carnegie's business representative, and Mr. Bertram is Mr. Carnegie's private secretary. The new corporation, therefore, becomes a ganglion of philanthropic funds with resources directly and in-

directly at its command probably larger than those of any other benevolent institution in the world. Its definite organization has followed promptly upon Mr. Carnegie's return from Europe October 20 last. The incorporators met at Mr. Carnegie's house on November 10, accepted the charter, adopted the constitution and by-laws, and elected the following officers:

President, Andrew Carnegie;
Vice-president, Elihu Root;
Treasurer, Robert A. Franks;
Secretary, James Bertram.

Mr. Carnegie transferred to the corporation \$25,000,000 par value first mortgage gold bonds of the United States Steel Corporation.

Mr. Carnegie will be seventy-seven years old on November 25, so that sixty-three years after he began work as a bobbin boy in a textile mill and ten years after his retirement from the American steel industry he rounds into a whole his scheme of philanthropic foundations and endows them jointly with an emperor's ransom. This latest gift, it is estimated, raises Mr. Carnegie's benefactions above the \$200,000,000 mark.

10-HOUR LAW BEFORE OHIO'S SUPREME BENCH

Louis D. Brandeis, "New England's attorney for the people," has been invited by the state of Ohio to defend the Woman's Ten-Hour Law before the Ohio Supreme Court. It was Mr. Brandeis who successfully defended the Oregon Ten-Hour Law before the Supreme Court of the United States. With the assistance of Josephine Goldmark he submitted a brief which brought the scientific and economic experience of the world before the Supreme bench of Illinois in a similar case and led it to reverse its decision of the 90's. Now the Ohio Supreme Court is to pass upon a kindred law enacted at the last session of the legislature.

Ohio well protects working children

and girls by prohibiting their employment after seven o'clock in the evening and by limiting their hours to eight a day. Ohio safe-guards young girls up to eighteen years, a higher standard than prevails, for instance, in New York and Illinois. But on the other hand, up to this year, although more than twenty states had some kind of protective legislation against the over-work of adult women, Ohio had no such law. Along with California, Washington, Missouri, and Wisconsin, the Ohio legislature of 1911, in response to public opinion, took action to come abreast of the progressive industrial commonwealths.

The Ohio law provides that women may not be employed more than ten hours in one day, nor more than fifty-four hours in the week, in such places of employment as factories, work-shops, restaurants, dress-making establishments, and telephone or telegraph offices. The law has a flaw from the social workers' standpoint in following the Michigan statute which exempts canneries from the restriction of hours.

During the past three years the Supreme Courts of the United States and of Illinois, Michigan, Louisiana, Virginia, and Missouri have decided that state legislature may safe guard the health of women by limiting their hours of labor. Similar cases are pending in California and Washington. The Ohio case was heard last month by Judge Dillon of the Court of Common Pleas of Franklin county, who held the law constitutional. The state Supreme Court has granted the application for leave to carry this test case from the county court of Common Pleas direct to the Supreme bench, in appearing for the state before which Attorney General Hogan has enlisted Mr. Brandeis's cooperation.

HERE'S TO THE HOMES OF ALL HOOSIERDOM

Indiana has the first State Housing Association. The prime mover in its organization is Albion Fellows Bacon of Evansville, a director of the National Housing Association and the author of the Indiana housing law of 1909. Linton A. Cox, of Indianapolis, is presi-

dent, C. S. Grout treasurer, and Mrs. Bacon secretary. These were the leaders in the campaign before the Indiana legislature last year for a more advanced statute which would have put Indiana at the top of the list of states. They lost by one vote after a rousing legislative battle, one of those defeats which in the long run sometimes prove better than victories, for it attracted popular notice, and the methods used by the law's opponents excited general indignation. The result has been a widespread interest, not only in Indiana, but also in the neighboring states of Ohio and Illinois, where Mrs. Bacon has been in great demand as a speaker at conventions, conferences, and chautauquas.

The purpose of the association is to educate the state on improved housing, to improve the present housing law, and to secure enforcement. The state body is modelled upon the National Housing Association, the chief difference being that the state organization will have a local chairman in each city, who will have charge of local membership, publicity, investigations, etc. The slogan of the new organization is "The Homes of Indiana" and to judge by the newspaper headlines, the slogan has reached them.

INTERNATIONAL CONGRESS ON HYGIENE AND DEMOGRAPHY

In response to the invitation of the United States government, twenty-one foreign countries and twenty-nine states have given notice to date that they will be represented at the International Congress of Hygiene and Demography which is to be held at Washington, September 23-28, 1912. The object of the congress is to extend the knowledge and improve the practice in hygiene, public health, and vital statistics in the countries which participate.

The work of the congress will include an exhibition, together with a series of scientific meetings in which leading specialists from all over the world, including representatives of our state and city health authorities, will take part. Eight sessions will be devoted to hygiene, including microbiology, parasitology, diabetics, and physiology; hygiene of in-

fancy, of childhood, and of the school; industrial and occupational hygiene; the control of infectious diseases; state and municipal hygiene; hygiene of traffic and transportation; military, naval, and tropical hygiene. The final session will be devoted to demography.

Provisional programs for all three sessions have been worked out. In preparing an exhibit showing recent progress and the present status of the public health movement, some twenty state committees, as well as representatives of foreign countries, are co-operating with the organization committee of the congress.

The president of the congress is Dr. Henry P. Walcott, president of the Massachusetts Board of Health. Dr. John S. Fulton, of Baltimore, is general secretary, and Dr. J. W. Schereschewsky of the United States Public Health Service is in charge of the exhibit. The president of the United States is honorary president. The committee on organization comprises sixty-eight names of experts on medical and social matters in all parts of the country. The secretary's address is Army Medical Museum, Washington, D. C. The membership fee is \$5.

"HEALTH DAY" AND A "HEALTH HARANGUE"

To help in "making Boston school children the healthiest in the world" the Boston School Committee, under the direction of Dr. Thomas F. Harrington, the director of hygiene, conducted its annual "Health Day" in October. In the lower grades the school nurses gave talks on the care of the teeth, school luncheons, cleanliness, and posture. In the elementary and high school classes a circular letter was read, which, as a health preachment for school purposes, may prove suggestive to other cities:

Sitting and standing in a natural, free, straight-back position exercises the back muscles and give the spine strength and stability. This means good circulation, good breathing, and healthy nerve-supply to the whole body. The games and plays in the early grades, as well as the setting-up drill and apparatus work in the high schools, have all been selected and planned to develop a firm arch, a straight spine, and a good chest capacity.

The examples of the benefit of cleanliness are no less striking than those of proper posture. The whole germ theory of disease rests almost wholly upon whether or not the germ of a particular disease can find elements of uncleanness with which to unite for its growth and development. Dirt on the teeth results in decay. Dirt on the skin results in skin eruptions and skin clogging. Dirt in the form of waste products means disease if not removed regularly.

Fresh air is needed for the system during the sleeping hours as well as during the waking hours. Air that has once been breathed is not fit to be breathed again. We should live in the open air, and if possible sleep in the open air, so as to get the fullest supply of pure air.

Sunshine kills many of the germs of disease, and if we live in the sunshine the body takes up this power of the sun's rays and stores it up to fight disease. Our blood becomes pale when we are deprived of sunshine, because it loses the force which the sun gives to the body. The loss of this force makes us easy prey for the germs of disease. Games, plays, athletics, and exercises in the open air and in the sunshine have been made a part of the school work because they offer the best means for an abundance of fresh air and sunshine.

The moral health is also dependent upon cleanliness and sunshine. The girl or boy whose mind is unclean, whether from evil associations, evil practices, unclean books, speech, or amusements, who does not live in the open sunshine of confidence with himself and with his parents, will sooner or later fall a victim to disease more serious than any physical ills. The boy who saps his life during the growing period by cigarette smoking, by excessive indulgence in athletics, or by a life devoid of recreation, is destroying an armor against attacks from disease which he must sooner or later meet.

Sunshine, both in nature and of the person, means joy and happiness. It is the best tonic we possess. Every person can possess it in abundance; with it all work is a pleasure; without it no labor is satisfying. The boy and the girl who grasp these lessons and make them the rule of life will lay a foundation for moral and physical health which will guarantee a degree of efficiency in later life far in excess of any estimation of success measured by any other terms.

THREE PHASES OF PITTSBURGH

Three new community enterprises have been launched this fall in Pittsburgh—a campaign for the conservation of child life, an economic survey, and a movement for boosting the district industrially.

The campaign for the conservation of child life includes a definite program,

frequent conferences, and the inspiration of visiting speakers. Through these the Associated Charities and the 120 bodies with which it is affiliated hope to concentrate attention for a year on the needs of Pittsburgh boys and girls in such manner as will lift the community's provision for them to a new level.

The plan, as announced through Secretary Charles F. Weller, has struck a popular chord both with Pittsburgh newspapers and among the religious workers of the city. Delegates from the constituent organizations will hold the first of the series of conferences on November 13, taking as their subject Juvenile Delinquency: Its Causes and their Possible Removal. Topics assigned for succeeding conferences are:

Progress and problems in the institutional care and training of dependent children.

Plans for the placing of dependent children, and the graduation of institutional children into normal family life.

Schooling and its proper relations to the after-life of the pupils.

Housing and home conditions; improvements needed.

Charity problems: including "school pensions" for the children of widows, compulsory support by neglectful fathers, adequate feeding, and the prevention of pauperization.

Working children: including newsboys, messengers, and bootblacks; their needs.

Health problems: including tuberculosis, the prevention of infant mortality, and the promotion of efficiency.

Moral problems: including sex hygiene, the work of churches, boys' clubs, settlements, and the "Boy Scout" movement.

Play, amusements, and recreation; dangers and needs.

Americanization of foreign-born families.

INDUSTRIAL PROMOTION

The Pittsburgh Industrial Development Commission was launched by the Pittsburgh Chamber of Commerce in September. An extensive program has been adopted on the lines suggested by the title of the commission and a campaign inaugurated for a \$250,000 fund wherewith to conduct a three years' effort "for the advertisement and exploitation of Pittsburgh's resources." Members of the commission are H. P. Bope, president; F. F. Nicola, vice-president; W. H. Donner, treasurer; D. P. Black, Morris Baer, James C. Chaplin, W. C. Cof-

fin, Robert Finney, Robert Garland, James F. Keenan, A. M. Schoyer, and J. M. Schoonmaker. The group is representative of enormous business enterprise in steel, railroads, and real estate. Mr. Bope, the president, is identified with the Carnegie Steel Company; Mr. Coffin with Jones and Laughlin, the leading independents; Messrs. Nicola and Black with real estate interests, and Mr. Finney and Colonel Schoonmaker with railroads serving the district. For manager the commission has secured W. A. Donkin, who was formerly connected with the Philadelphia company which furnishes street car service, electric light, and natural gas to Pittsburgh. E. P. Douglas, the secretary, has been with the First National Bank for a number of years.

The main purpose of the commission is indicated in the first plank of its platform. It pledges itself to "business organization, using practically the same methods in securing industries for this district that an aggressive merchant or manufacturer would use in expanding his business." While none of the members of the new commission have been prominent in the aggressive struggles for municipal reform recently waged in Pittsburgh, two planks of the platform suggest the possibility of broadening out the work of the commission toward civic improvement as differentiated from commercial success. They are: "Increase the housing facilities so that labor may live well at a moderate cost," and "Increase our present means of recreation for labor, thus making Pittsburgh more attractive for health, pleasure, and convenience than other cities."

The Economic Survey is an enterprise of the city administration, made possible by an appropriation of \$5,000 by Pittsburgh's new council of nine men. Mayor Magee has appointed as director Professor J. T. Holdsworth, of the University of Pittsburgh and formerly of the University of Pennsylvania. One of his first lines of inquiry bears on the present movement to "boom" Pittsburgh industrially. He will assemble data relative to freight rates and collect other information for use in the campaign for diversified industries. How

far the scope of Dr. Holdsworth's investigations will include such phases of the general economic problem as housing, recreation facilities, and the cost of living with its prime factors—rents and food prices—has not been definitely announced.

EDITORIAL GRIST

RESPONSIBILITY OF THE SMALL INVESTOR

CHARLES M. CABOT
Boston

The small investor in a large corporation is apt to criticise the management of the corporation just as the average citizen in a large city curses the incompetent government of his city. He does not seem to realize that in each case a share of the responsibility is his. There is to-day a widespread belief that serious evils obtain in the management of the combinations of capital known as corporations and, when large and powerful enough, as trusts. As there is seldom so large a volume of smoke without some fire, it is safe to assume that there is some ground for this belief, and that the feeling of the public is to some extent justified by the facts. But, admitting the evils, who is to blame? There can be no doubt that the people who for the past few years have been to blame for all the scandals that have shocked the community have been the presidents and directors of the various corporations that have undergone investigation whether by the government or by the much abused muck-rakers. This is natural, for the president and directors of a corporation are most directly concerned with its policies and its management.

But while it is natural that the blame shall fall on these men, is it fair and just? Look at the political field. Is it not true that most of the evils which we see in municipal government are traceable to the fact that the average citizen has taken so little interest in the government of his city, and has been content except on election day to leave it in the hands of the office-holders and the "ma-

chines"? The result has been that instead of "government of the people, for the people, and by the people" it would be more nearly true to say that we have had government of the people, for the bosses, and by the machines. The first sign that the people had begun to realize this situation was the organization of reform movements variously known as citizens' parties, independent voters' leagues, good government clubs, etc. But it was seen that the old party machines still held a tremendous advantage in their grasp of the political machinery, and the present strong movement towards direct popular government is the outcome. Whether this movement will not defeat its own object, good government, by running to extremes, it is of course too early to say. But the tendency is a healthy one. To insure good government the people must have an important part in determining important policies. If, on the other hand, too many questions are put before them, they are likely to lose interest.

The management of large combinations of capital presents the same difficulties and is susceptible of improvement along similar lines. It would be impossible to induce men of the necessary ability to serve as directors of our great corporations if they felt that each step they took was subject to hasty criticism and revision by stock-holders. On the other hand, knowledge of the facts by stock-holders and intelligent criticism based upon those facts would, I believe, be welcomed by many directors who today bear the whole responsibility for the policies of their corporations. Such a relation would imply an active and intelligent interest in their own business on the part of the stock-holders, and a cordial willingness on the part of the management to let the facts be known. Neither of these conditions exist today and it is no simple matter to bring them about. But as surely as the success of democratic government depends on the loyalty of the individual citizen to his duties to the community, just so surely, I believe, will the continued existence of great combinations of capital in anything like their present form depend in a large degree on the realization and

assumption by investors small and large of the responsibility that they owe to the community, to their employes, and to one another.

THE KEystone OF THE ARCH

JOHN COLLIER

The Social Center Conference at Madison looked two ways—toward the problem of the public school and toward the problem of American democracy. To the writer, this conference opened up the most fascinating, inspiring vista that he has encountered among the movements of our day.

The conference met to consider certain questions that are pressing for answer the country over. These questions, viewed from the public school standpoint, are three:

1. Must the public school, in avoiding the sectarian religious element on the one hand, and the partisan political element on the other, forever sacrifice ethical teaching and civic influence?

2. The public school is weighed on by an ever-increasing demand, imperfectly met, for technical education, business education, rhetorical education, intellectual drill of every sort. How can the school find time or strength to care for the social and emotional development of the child, which are basic to everything?

3. Once the family and the church helped to fire and guide the child's emotional nature, but the family and church are dwindling parts of the child's total conscious environment. American life is making a veritable assault on the unity of the family. The school has most largely contributed to this very process. What shall be the future? Shall the school continue to perfect itself as a *substitute* for the family? How can the school be made to become an enlarged family environment, united with the family life and the neighborhood life?

At the Madison conference the social center was put forward as a deliberate answer to these questions. If the social center theory is correct, two results are destined to come, one immediate and one remote:

1. The school will continue during

regular school hours to do its more technical, special, and standardized work for the child. Into the regular school hours will be compressed everything which requires the compulsory attendance law to enforce—everything that will not be spontaneously sought, if opportunity be given, after the regular school hours. After school hours the school will be used just as thoroughly, just as systematically, to provide those things which, if properly conducted, will be spontaneously pursued by the child and by the family group. Citizenship, ethics, social good-will, the many-sided education that comes through play, and aesthetics, will be largely given after school hours.

2. Such a development of the school will exert a profound reaction on the regular school curriculum. To develop in the mind of the adult public a criterion for educational efficiency; and to prove the value of spontaneous interest in making possible the hitherto impossible in education: what greater contribution could be made to educational science? The social center will make this contribution.

Another thought was added to these by the social center conference. It was the thought of progressive democracy as applied to the wider use of the school plant. If centralization, redeemed by co-operation, is necessary in the conduct of the regular school, just as clearly must local initiative, organized in self-governing ways, be the basis for the wider use of the school. At the conference there was almost an over-insistence on the importance of free discussion, but this insistence was justified by the conception of self-government within the center. For self-government, and fruitful local initiative, can be secured only where free discussion is allowed.

It seemed to the writer that the social center conference was working very close to that point in the arch of American institutions where the school, and scholarship, and science, on the one side, and public action, the family life, and the vast, vague emotional life of the people, on the other side, are destined to be joined and made one. The social center may prove to be the keystone in the completed arch of American life.

CIVICS

ARCHITECTURAL METHODS FOR FIRE PREVENTION¹

CHRISTOPHER CLARKE

Massachusetts State Firemen's Association

Notwithstanding the enormous expenditures for fire-proof materials in the construction of so-called fire-proof buildings, little or no provision has been made to prevent flames and smoke from reaching the upper stories of the buildings. Through this failure, in many instances, the lives of the inmates have been surrendered, with no hope or possibility of rescue, and the buildings so seriously damaged as practically to require rebuilding above the foundation.

Can buildings be so constructed and altered as to make them safe for life and property?

I am confident that such a thing can be accomplished by simple and effective methods, that will when adopted make what will in fact be a compartment building, which shall have fire-proof division walls, and fire-steps of some sort at every story or stairway landing, so as effectively to prevent the flames and smoke from spreading beyond the story in which the fire begins.

The changes of construction which I consider necessary to be made for protection of life and property are:

First. Every building to be erected in the future should, so far as possible, be divided into separate compartments, either by permanent fire-proof walls, doors, or fire-steps of wood covered with metals, so arranged as to be instantly closed by automatic or other means (already in use) to shut off the fire and smoke from going beyond the story in which the fire originates.

Second. The adoption of fire-proof stairways, enclosed in fire-proof compartments, or towers, according to the architecture or demands of the building, should be made obligatory in all new buildings and as far as possible in all buildings where fire-escapes are demanded, so as to secure a certain means of escape from each story to the ground, independent of the ordinary stairways that are

many times instantly blocked by fire and smoke. This danger was demonstrated at the Park Avenue Hotel fire in New York, a fire-proof structure in which twenty-two persons lost their lives for want of this protection, the fire starting at the foot of the elevator.

Third. The use of fire-proof shutters and the standard insurance fire-proof doors should be enforced in all buildings where very inflammable goods, such as oil or raw materials, are stored. These when burning constitute a great danger and are often the cause of a general conflagration, resulting in the destruction of an immense amount of property. Under the present method of building, such fires often cannot be controlled by the best departments of the country and no year passes that does not record the deaths of many firemen, sacrificed in fighting fires in these unsafe buildings. Had the Hearst Building, in Baltimore, been provided with the fire-proof shutters and fire-stops that I advise in this article, the fire would never have spread to any other building, but would soon have been under control, and the immense loss by the conflagration would, in my opinion, have been prevented.

Fourth. The use of metal or fire-proof roofs should in some way be made more general, especially in wooden and high buildings. The danger to surrounding property from burning buildings (high or low) that have shingle or wooden roofs is very great. It is well-known that live cinders and fire-brands are carried by the wind miles from a burning building, starting new fires that may destroy an enormous amount of property. In many instances a large district in a city, covering hundreds of acres, has been burned over through this cause. The present mode of construction in all our cities and towns is very largely responsible for a yearly fire loss of over two hundred and fifty million dollars. It is well known that a fire seldom spreads to an adjoining building when the building on fire has a metal roof with no openings in it, and when the windows are protected by fire-proof shutters of the underwriters' standard type, of wood covered with metal, or the new

¹This article is the substance of an address delivered by Mr. Clarke before a convention of fire engineers in New York over four years ago. The specific recommendations he made, their identity with many of the plans now under discussion, and the obvious fact that if carried out in law and enforcement they would have gone a very long way toward preventing the terrible fires of the past year, are a commentary on the lethargy of public opinion. They are also a challenge to the organizations and officials who are committed to

the promotion of new and effective standards not to let the present public interest die down until New York and every American city is safe; and that safety is attested in lower fire insurance rates.

It was back in 1885 that Mr. Clarke invented the tower fire-escape referred to in this text.

"At eighty-four," he writes, "I am still fighting for better protection of life and property in this country, which I commenced twenty-five years ago."

invention of fire-proof and wired glass, a most admirable protection, especially from exposure to fire from adjoining buildings.

All elevators, ash chutes, and dumb-waiters should be built in brick or fire-proof inclosures, with fire-proof doors at each entrance to the elevator, and with fire-proof self-closing elevator traps for all manufacturing buildings. No passenger elevator should ever be allowed to be built except in a fire-proof enclosure, as the elevator shaft acts as an air-shaft instantly to conduct the flames and smoke to the top of the structure, often rendering escape from the upper stories impossible. There should be no exception made as to elevators in buildings where people work or lodge above the second story.

One of the most important means of saving life and property from destruction by fire or panic is the new compartment tower, by which the inmates of the building have an entrance at every floor to a series of separate incombustible tower stairways, independent of each other, in one tower reaching to the ground. The ordinary stairways of the building, being open, may instantly be enveloped in flames and smoke. Over one hundred fire-escape towers have already been built in the city of Philadelphia, and there is no possible doubt that this means of escape is the most reliable one in use, and is imperatively demanded by the increased height and size of buildings now in use throughout the country.

The towers are also an instant means by which the firemen may reach any story of the building, and the standpipes for water placed in the tower and protected from freezing can instantly be utilized to put out the fire. The sprinkler system can also be protected in the same tower or compartment. Any law adopted should include requirements for the use of the above-described tower or compartment stairways protection. This would result in an enormous saving of life and property in the future.

Balcony and ladder escapes are without question under many conditions dangerous to the last degree; for when the fire breaks out under or near them, or they are covered with ice, they cannot be used safely or at all, and have thus made possible the death of many thousands of persons. The tower or compartment escapes when required can be embodied in new constructions so as to reduce their cost very much, and at the same time beautify the architecture of the building. They can also

be utilized for ordinary purposes, and thus save a large special outlay. They can also be attached to all old brick constructions at very little cost.

Another effective aid in the prevention of the spread of fire in buildings where the ordinary lath and plaster partitions are or have been used is to fill in the space between the base or mop-board of every story and ceiling of the upper stories with six inches or more of plaster, concrete, mineral wool, or any other fire-proof material, so as to prevent fire or smoke from running up through. These partitions are generally open to the top of the building, and it is impossible for the firemen to reach the enclosed fire, for the lath and plastered partition protect it from contact with the water. The cost of this safeguard is very small and will alone save an enormous amount of property from destruction.

These open partitions are now found in the majority of our hotels, stores, and dwelling-houses, new and old, and were the cause of the rapid destruction and great loss of life in the Windsor Hotel fire in New York, the whole house being instantly in flames. Requirement of this fire-stop protection, therefore, should be embodied in any state law or city ordinance that may be adopted in the future.

One of the best and newest fire-proof partitions is made of plaster blocks, upon which different kinds of plaster finish are used. These blocks are made two or three inches thick, take up less floor-space than the lath and plaster partitions, and are fire- and vermin-proof and durable. They are now very much used in the better class of buildings, and make an economical fire-stop division wall that is far safer than any kind of lath and plaster partition now in use.

Openings for skylights should not be allowed on any floors above the second story, if possible to avoid their use there, but if indispensable and adopted, they should have fire-proof closures at each floor, to prevent the fire and smoke from being instantly carried upward through the open spaces from story to story. If the fire has been smouldering for some time before it breaks out into the cooler air spaces or upper rooms where large stocks of inflammable goods or material are stored, the latter are instantly set on fire by the superheated air and flames, and an explosion may take place by which walls sixteen or twenty inches in thickness may be shattered or thrown

down and firemen and fire-apparatus destroyed.

The explosion reported to have caused the conflagration in the Hearst Building in Baltimore was undoubtedly responsible for that disaster, and I have in my own experience seen the heaviest brick walls in a fine new construction destroyed as instantly as if dynamite or powder had been used.

In stores, high side windows with fire-proof inside or outside shutters or wired-glass windows will answer a very good purpose, to show goods and still protect the building from fire from adjoining buildings. The immense stocks of highly inflammable goods in all department-stores without the above-described protections, when crowded with customers, are nearly as great a menace to life as the unprotected theater. These great department-stores should be divided and sub-divided into compartments; each department should be protected with fire-proof movable closures or fire-proof division walls, and should always have enclosed fire-proof towers or enclosed stairways connecting each story to a ground or subway exit.

The adoption of additional protection, not by any means so thorough as the methods I have described above, has enabled the Manufacturers' Mutual Insurance companies in Massachusetts to give a very low rate on manufacturers' buildings and storehouses. The adoption of the changes I have suggested will be a splendid investment, beyond doubt secure

safe buildings, and reduce the cost of insurance largely. It was stated in the last International Convention of Fire Chiefs and Engineers, in the city of New York, which the late Edward Atkinson and myself addressed on this subject, that there were no proper protective building laws in any state or city in this country. This is absolutely true, and is proved by the fact of a fire loss fast advancing to two hundred and fifty million dollars yearly.

The summing up of this appeal for better protection is this: There is no question whatever that the protections named can be adapted to new and old buildings at a cost which is not excessive, nor beyond the means of any builder, corporation, or persons interested in real estate investment; and the sum saved in money by reduced rates for future insurance will certainly pay for all the additional cost of these protections many times over in the life of the building.

In Berlin, with a population of nearly two millions, there are over thirty-three thousand buildings, constructed on this general compartment (government) plan, with the result that no such thing as a great conflagration can possibly take place. The same is true of Paris and other continental cities. There should, therefore, be no doubt or delay on the part of the legislatures and cities of this country in passing laws and city ordinances that will procure better protection from future losses of life and property by fire.

REGULATING CITY BUILDING

JENS JENSEN

Chairman City Planning Committee of the Chicago City Club

Americans are continually criticised for their lack of conservatism, for their temporary enthusiasms which sweep the country like prairie winds and leave no permanent effect. When we regard professional efforts as they are being directed along so-called new lines of activity, this criticism seems to be not without justification. Just now, city planning is rapidly rising on the wave of popular enthusiasm. It has taken our cities by storm. A new profession has come into life. Plans are rapidly being made, and the zealous public, gazing upon their depiction of gayly colored parks, wide boulevards, and ornate bridges, is fired with the desire to make all American cities

such pleasing pictures as the clever draughtsman has represented on paper. But it is too much to assume that our cities can be transformed as quickly as the paper receives the ink of the enthusiastic designer, nor is it to be expected that the lines so cleverly laid down by the rule can be as readily cut through the physical complexities of a great city. Our laws do not give arbitrary power as do those of some European cities, and on account of this the immediate effects of our planning must fail. To cut a broad street through the city is one thing, to have the sides of it lined with buildings of harmonious façade is another, and on this last depends a satisfactory work-

ing out of the plan; but where is the law to provide for this?

On the face of it, this idea of city planning is a fine thing—broad boulevards, ornate arches, formal promenades, all give one a feeling of excitement, as of being dressed in one's best clothes for some festive occasion. But right here is one of the most salient evils of such a city. It is too often a show city; it is at once the city of palaces and of box-like houses where humanity is packed together like cattle in railroad cars. To build civic centers and magnificent boulevards, leaving the greatest part of the city in filth and squalor, is to tell an untruth, to put on a false front, which vitiates the whole atmosphere of the town. The formal show environment reacts upon the people: the spirit of being on parade, of striving always for superficialities, makes of them a city of spendthrifts desirous of a gay life. As a consequence, immorality, strife, and discontent grow. The formal show city is distinctly imperialistic. It is undemocratic and its tendencies are destructive to the morals of its people. The more formality in design the less democracy in its feeling and tendency.

A show city is supposed to have a commercial value and, indeed, such a city will attract crowds to view its splendors and spend their money; but like the show itself, it needs constant variation or it becomes tiresome and loses its drawing qualities—it must have a new dress every so often, in order to entertain its crowds of visitors. But is the American city to be a commercial proposition with no other interest in its own people? Or is it to be a city of ideal homes, with a healthful expression of its business life? The American home is the foundation upon which the world's greatest democracy rests. It is the unit, of which the city is made up, and in it should center the whole force of city planning, in order to foster the highest ideals in its people, and to be an expression of the best in mankind. A city should first of all, then, be home-like. May not this be secured by a system of regulation?

Such regulation of the city might be in the hands of a new department, a department of civics, consisting of the best talent in art and science which the community possesses. Such a department might be made up of an engineer, an architect, a good business man, a sculptor, a landscape architect—the number depending upon the particular conditions of the individual city, and the vocations of the mem-

bers to be a far less important consideration in determining membership than their public spirit. The members should be appointed for a period of not less than six years, one member retiring every year, and their removal from office should be subject to judicial inquiry. This department would guide, advise, adjust, and pass upon all matters pertaining to the building of our cities and their extension through the purchase of land, new subdivisions, or the annexation of suburbs. Every expression of city development would be directed along the best possible lines by men fitted to consider not only artistic but utilitarian stand-points as well. It would pass upon transportation facilities, depot and freight yard terminals, harbor and river development, markets, lighting, and bridges. Designs for all municipal buildings, building sites, and public works of art would be submitted to it for approval. It would give advice in regard to the location and design of churches, clubs, hospitals, and depots, encouraging centers where an association of buildings is possible. Through conference with the civic board of control, each new public building erected would be constructed with a view to improving the city as a whole. No additional funds would be necessary to effect this; the buildings would cost no more than under the old scheme, but they would be located and planned with the help of the best authorities, not only with the special requirements of the buildings but with the good of the entire city under consideration. The services of the department of civics would be at the disposal of the public and semi-public corporations, and it would offer to promoters suggestions concerning prospective factories both as to situation and design, thus improving not only the sanitary conditions of the factory and its environs, but making it an interesting note in the city as well. It would prevent tenement housing through law or honest taxation, and promote cleanliness and health throughout our urban life. The department of civics would determine the width of streets and sidewalks with the future development of the city in view. A practical suggestion on this question of street widening might not be amiss at this point. It can be accomplished gradually by establishing a new curb line as a street changes from a residence to a business district, thus avoiding the great cost involved in condemning and moving expensive business buildings. Guided by the most competent of its citizens the city

would improve step by step, day by day, in a sane and natural manner, rather than in the spasmodic spurts which result from business booms.

One of the most important duties of the board of civic control would be to develop the school as a neighborhood center, to unite home life with that of the school, to make the school a place of interest for both young and old. It is here that the boy and girl receive some of their most lasting impressions; the school is the point about which their early associations cluster; there is no reason why it should not continue to be a center of culture and healthful recreation throughout their lives, and remain as a pleasant spot to which they may return when old. Here recreation which left to itself is liable to take vicious forms could be made an uplifting influence. By providing halls for music, lectures, dancing, and the production of plays, higher tastes could be cultivated. If the same authority which provides schools for the children is giving the father and mother an enjoyable evening full of color and music, it follows that the parents will be more interested in what their children are doing. Their whole field of interests is going to be bettered and at the same time united with that of their children.

The playground also would be established as a part of this neighborhood center. It belongs to the school and should not be conducted as a separate institution. Each gains from an association with the other. The playground gives the school building a setting which it too often lacks, and forms a kind of outdoor gymnasium. The activities of the playground on the other hand can be much more economically and effectively housed and directed in the school building than in a separate field house. Are not the functions of the playground more closely related to the school than to the park, with which it is generally associated?

Public and semi-public buildings such as churches, settlements, and club halls should form a part of the neighborhood center. They would here secure breadth and beauty of surroundings, add their quota of interest to the center, and serve the people to far greater advantage than when situated in a less accessible spot. These centers of enlightenment must be developed if our cities are to produce a people who will become a real factor in the progress of the world.

Another relation which should be established in the improved city is a union of home and workshop. Separation of factory and home means a greater breach between capital and labor, an opportunity for militant defense in time of strike which causes a defiant spirit. It means as well greater congestion in our streets and reduced vitality for the workman. Travel for long distances on crowded cars tires him out, and makes him indifferent to healthful pleasure during his free hours. He has not enough strength left for the much needed outing with his family. Wholesome

A TUNNEL ENTRANCE, STUTTGART.

pleasure of this sort is essential to a right development of mind and body in the making of fit citizens for the republic. The union of factory and home means first of all better relations between employer and employe, it means more sanitary factory surroundings and more healthful interiors, together with greater effort for good design in the buildings. The factory as a building should become an important consideration in the city landscape, instead of giving rise to the smoky, unsightly communities that exist in so many instances. If properly located and designed there is no reason why it should not become a picturesque part of the city. Here again a center may be formed. Several factories may locate together about a square with its public fountain and parkway. The square affords a setting for the factory buildings and gives so much more light and healthful air to the employes. With the improved factory surroundings the task of uniting home and factory becomes comparatively simple. The factor which is able to effect this union is electricity; through it we may return to the same conditions, though on a larger and more improved scale, which existed between workmen and shop before machinery was invented. Next to the school center in importance to the modern city, artistically and socially, stands the factory center. Other centers to be developed are the depot center, the market center, etc.

To further every movement that stands for a better city—to make our cities more livable, home-like, places for all our people, especially for those who through the force of circumstances must endure the city the year around—proper regulation guided by high ideals and common sense ought to be effective.

The melting pot is still boiling, American character still in making. We may plan cities for the future; but how many of these plans will be accepted by the Americans to come is a question. We can not say to future generations, "Build thus and so"; but by careful regulation we can build our present-day cities in the spirit of sound and wholesome democracy which is the best foundation for the future.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

TEN MINUTES FROM A PARK

The recent decision of the Supreme Court of Washington that a contested election, held May 3, 1910, was valid, gives the park commissioners of Spokane a million dollars for park sites, playgrounds, and improvements. One-quarter of the sum is to be used for playgrounds. The amount is so large for a city the size of Spokane as to make one credit the big promise of the commissioners that soon there will be no home in that whole city situated more than a ten-minutes' walk from a park or a playground.

MUNICIPAL REFERENCE LIBRARIES

St. Louis has joined the list of cities that have established municipal reference libraries in the city hall. The other cities are Baltimore, Kansas City, Milwaukee, and Minneapolis—municipalities that are not only recognized as leaders, but that are so well distributed as to give to the movement a very helpful start. Even more, however, than in the case of the usual public library, the effectiveness of these archives will depend upon the men who have charge of them rather than upon the collections they contain. For that reason it is important that location in the city hall should not be permitted to mean political management. That there is great confidence in the St. Louis experiment is indicated by the fact that the Civic League has turned over to the library its entire collection of pamphlets and scrap-books.

GOOD PARK ARGUMENTS

Probably one could count on his fingers, perhaps on the fingers of one hand, the cities as large as Columbus, O., which have not park commissions. But Columbus, one of the cities, has been seriously considering the advisability of securing one. In an editorial discussion of the matter in a local paper, a useful argument was neatly put. After noting that some of the opposition came from those "who seemed to feel that because Columbus cannot have all the things it needs to meet the requirements of the greater city, it should have none", the writer remarked that this would be a proper "attitude for a humorist to take", and then said: "The way—and the only way—to provide Columbus with the improvements that are necessary is to begin, to provide one, and then proceed to another. Nobody gets at one and the same time all the things he wants or needs. The acquisition is gradual and proceeds as rapidly as circumstances will allow; but one success is an incentive to the effort that makes another."

In this connection the Memphis Park Commission gives some interesting statistics in its report, quoting the following contribution of an abstract company: "From information gathered from conveyances of land, a record of which we have in this office, we find that on November 14, 1901, the date of the warranty deed from Overton Lea to the city of Memphis of the land known as Overton Park, the abutting property was worth \$70,200, and that it is now worth \$735,000. Before For-

rest Park was developed the abutting property was worth \$112,670; that it is now worth \$381,100. That the value of lands fronting the Parkway, from Trezevant avenue to Riverside Park, in 1903 was about \$279,000 and is now \$837,000." As the commission remarks, these figures suggest that park investments are very good from a financial point of view, to say nothing of their returns in health and pleasure.

PRIZES FOR LOCAL VIEWS

For two years the Civic Federation of Newton, Mass., has given prizes for the best photographs of representative views of the city's more attractive features. The pictures will be kept permanently, probably in the Newton Public Library, and it is expected that gradually an adequate and comprehensive collection, which will greatly increase in value as time goes on, will be gathered. This year's competition closed November 15, and the pictures have been placed on exhibition. The following are the prizes offered: "Parks, streets, trees, rivers, lakes, and nature in general: first prize, \$25; second prize, \$15; third prize, \$10. Public buildings, institutions, memorials, bridges, historical houses, and architectural features: first prize \$25; second prize, \$15; third prize, \$10."

A HINT FOR OLD-HOME WEEK

It has long been a custom in the Amo part of China, says a news note in *Municipal Journal*, for returning townsmen who have become wealthy during their absence abroad to present some work of public improvement to their fellow citizens. In accordance with this habit one Chinaman, who has recently returned from the Philippines, has arranged for the construction of a bridge of reinforced concrete, at a cost of \$42,000 (Mexican), as a gift to his native village.

CITY PLANNING IN LOS ANGELES

The City Planning Committee of Los Angeles has submitted to the mayor its first annual report. In accordance with the suggestion of a city planner who was retained to make a study of the city a few years ago, it recommends that the hill which now forms the site of the normal school should be acquired. Upon this noble site it urges that the public library, the art gallery, and an auditorium be erected. To make practicable this ambitious enterprise, which is so rich in promise for the city, the committee suggests a popular bond issue for the acquirement of the land, the bonds to be in \$10 amounts, or possibly even less, and subject to redemption by the city at par at any time. It is recommended that all civic bodies be asked to cooperate in making the bond issue a success. Alternative projects are the gift of the land to the city by public-spirited citizens, or the formation of a holding company, to acquire and keep the site until the city is ready to buy it. The committee strongly endorses the garden cities established in Europe, and expresses the hope that private enterprise will develop such industrial centers around Los

Angeles, retaining for their planning experts who are able to embody the best thought in their development. It advocates neighborhood social centers, the more artistic subdivision of residence property, and the establishment of a municipal beach on the ocean front.

A SIGNIFICANT COINCIDENCE

Here are two news items which happen to arrive together. Their juxtaposition is so interesting in its significance of the widespread character of the civic improvement effort that they are given without further comment.—The Women's Co-operative Civic League of Baraboo, Wis., has been formed for the purpose of making Baraboo more beautiful. Its first work will be the improvement of the cemeteries and of the street that leads to them. In a Texas town the school-boys have organized into weed-cutting companies, each with its officers. To each group a certain section of the town was assigned for a three-day assault. Every weed was driven from the streets and alleys. The companies, however, were continued, and there was talk of a state organization.

AN AMERICAN MUNICIPAL FOREST

San Diego, Calif., is said to be the first American city to take up scientific forestry as a municipal enterprise. It has, however, an exceptional opportunity. The city owns 7,000 acres of land that has heretofore lain waste, as a heritage from the time when it was a Mexican pueblo. This tract is now set aside for growing eucalypti, and last spring forty thousand seedlings were planted. Eucalyptus is very valuable and takes the place of many of the more familiar hardwoods that are becoming so expensive; it grows with truly tropical rapidity; it will stand an enormous amount of cutting, and seems to thrive under it; and a grove once well started apparently will last forever. In San Diego the more optimistic tax-payers are looking forward to a time when the forest will relieve them of all taxes and perhaps even pay them for being citizens of San Diego!

PLAYGROUNDS NOT OUTGROWN

The Playground Commission of Cambridge, Mass., in making a plea for a generous playground appropriation, puts thus forcibly the argument for recreation grounds: "When the children grow old enough to work, the need of facilities for exercise and recreation does not cease. At the age of most rapid physical development we allow our children to be shut up all day in shops and factories. It is all the more necessary that we should take care to give them a chance for healthful vigorous exercise, properly supervised and directed, out of hours, in the evenings and on Saturday afternoon, if we cannot do it on Sunday. The health, bodily and mental, of the parents of the next generation should not be neglected at the most critical time. Nor should the older men and women be left without a chance to share in the benefits of the playgrounds. They are able to share the joy and the profit of out-of-door exercise."

HEALTH

A VACATION IN THE COUNTRY.

Special summer work at the summer home for crippled children at Southampton, Long Island, maintained by the Post Graduate Hospital, New York.

CARE OF CRIPPLED CHILDREN

DOUGLAS C. McMURTRIE

New York

Shall crippled children continue to be neglected children? That question has had a reasonably adequate negative answer in Boston, New York, Philadelphia, Baltimore, Chicago, and St. Paul. In many of the other cities of the country, however, it has had no answer, and the result is a pitiful lack of care and education for children thus handicapped. Excepting hospitals there are no institutions west of St. Paul and south of Baltimore furnishing anything approaching comprehensive care of crippled children; and other than medical or surgical attention is even more sporadic and inadequate.

The needs of crippled children are several. First and most important is physical care. This in many instances solves the problem completely through an entire cure, thus restoring the patient to the class of normal children. In almost all cases it greatly reduces the deformity of the child and renders the difficulties less acute. Other needs, broadly, are social and moral. To meet these, there is demanded education, moral training, and the other means leading to general development, or modified to fit the individual case, and calculated to make the child's position and attitude as normal as possible.

Practically all of the present-day work for cripples can be classified under two heads; one is the residential or institutional system, by which they are cared for in separate homes away from their families, and the other the non-residential system, which provides care during the day-time only, the children still living with their families. The choice of system depends on the individual case. Where the child's physical condition demands constant attention, a resident home with full medical and surgical equipment is very naturally the more desirable. But in cases where the child's physical deformity is more or less chronic or permanent and the surgical care required is infrequent and not extensive, very excellent results are attained by the non-residential system, by which children are given their physical care at the clinics, their education in day schools, their more intimate care at home, and at the same time are not separated from their families.

The residential or "home" system is by far the older. The first institution of this type in the world was established in Munich in 1832, and the first in the United States in 1863. Other homes were founded soon after, and the number has been growing ever since,

until there are at present in this country quite a few institutions of this type. The first homes were mainly asylums of shelter. They have been improved, however, until the modern institution, often handsome and homelike, is provided with full facilities for general and special care and education.

Like most philanthropic efforts the first care for cripples was undertaken at private initiative and expense. In 1897, however, the state of Minnesota recognized its duty to its crippled children and founded an excellent work for them. Minnesota's example was soon followed by New York and Massachusetts.

The ideal institution will, of course, be planned primarily for the needs of the children. The first, as already stated, is physical. Crippled children can do more at physical exercise than is generally supposed. The Massachusetts Hospital School in Canton, for instance, has a base ball team which wins a majority of its games with near-by teams which are made up of boys of the same age but physically normal. Of course, many must be restrained on advice of their physician, but others, if encouraged, can attain great dexterity—so much as to surprise the average visitor. Corrective gymnastics have a distinct orthopedic value when given under proper direction, and the necessary apparatus will be found at several of the more modern homes. Since so many of the children suffer from tubercular joints, much time should be spent in the open air and the building plan should have this in view.

The manner of meeting other needs is open to more question. Practically all agree, how-

ever, that the child should be given a good primary education. The first thought is too often to abbreviate the schooling of cripples because they are not as strong as normal pupils, but it has been found very generally that the greater individual attention on the part of the teacher, which is necessitated by the varying conditions of the children, more than makes up for the retardation due to impaired strength or shorter hours. Furthermore, the paucity of interests for these children and the consequent enhancement of interest in and application to school work weakens the lure of the street and other activities of childhood; the average crippled child has been compelled to spend so many days out of school, away from other children, that lessons seem to him much more attractive than to the normal child. Contrary to the popular conception the crippled child is as capable mentally as his normal brother; and, as in the case of normal children, the best practice has shown the absolute necessity of separating from mentally normal crippled children any feeble-minded cases. This is often disregarded.

The social considerations are important, and provision for them depends largely on the human sympathy and breadth of vision of those in charge. It must be remembered that the average crippled child comes to an institution broken in spirit and discouraged. All his life he has felt that he is a useless member of the community—that he is hopelessly handicapped. The truth of this has seemingly been demonstrated to him, for every day he has realized that he could not do the

WHERE THE SCHOOL PRIVILEGE IS SPECIALLY APPRECIATED.

SPECIAL SCHOOL EQUIPMENT.

Type of adjustable chairs and desks used in non-resident work.

things that his brothers and sisters were doing. His inactivities alone engender hopelessness. Manifestly the first duty of those endeavoring to help him will be to correct this idea. The awakening of ambition is a prerequisite to efficient and continued effort. The eventual aim is to render the cripple self-supporting, thus enabling him to take his place as an independent member of society. To this end some form of industrial training has been found valuable.

For girls the problem is comparatively easy, the solution in almost all cases being needlework of some kind, ranging from plain sewing to embroidery. One institution has made a specialty of feather-stitching and the students have become so proficient that they do almost all the work in this line in their city. The proceeds render the class self-supporting. The endeavor should be to turn out at a reasonable profit a product which will hold its own in commercial competition.

In the case of the boys the problem of industrial training presents more complications, perhaps, because so many fields are open to male endeavor, but the following trades have been taught with success: printing, typesetting, making jewelry by hand, electrical repairing, switch-board operating, telegraphy, basket- and rug-making, carpentry, shoe-making and repairing, wood-turning. I suggest, as an untried trade which seems to offer great promise, watch-making and repairing. The work would seem excellently adapted to cripples, and I am informed that there is a considerable scarcity of competent operatives in this line.

Incidentally, since the children who receive treatment in such homes come largely from poor surroundings, to which they will later return, it is well not to have the discrepancies in comforts, not to say luxuries, too great. While nothing should be spared to make the physical and educational care the best, anything verging on extravagance should be avoided.

Passing to the non-residential plan, we find that after its successful trial in England the idea spread remarkably, and in 1894 the Boston Industrial School for Crippled and Deformed Children, the pioneer institution of the kind in this country, was founded. It was followed by the establishment in New York city by the Children's Aid Society of a series of special classes for crippled children. Later the auxiliary to the Avenue B School developed into the Association for the Aid of Crippled Children. Largely through the influence of this association a significant advance was made in 1906 when the New York City Board of Education opened a special class for crippled children in one of the public schools. To this class the association agreed to transport the children. Many of these special classes are now maintained by the Board of Education, three private organizations co-operating to furnish the transportation and supplementary care. Chicago made special provision for crippled children at the Spalding and Fallon Schools, transportation being furnished by the Board of Education.

The pedagogical considerations are not essentially different from those discussed for the residential system, except that the class period in the New York city classes is four hours instead of the five which are given the normal pupils. The additional individual attention made possible by limitation of the classes to twenty enables the crippled children to make the regular rate of progress.

When a crippled child first begins to attend one of these classes, it is generally after a long period of neglect. Often the mother is very poor and can do little; in many cases she does not know what to do; and in other cases the child may have come to seem an unmitigated burden. The social needs—which, by the way, can not be met by the schools, but must depend on private agencies—are hardly less acute than the educational, and they are usually met in one of two ways: either by bluntly furnishing the requisite ar-

ticles, or by sending nurses or other trained visitors into the home, securing the confidence of the family, and working from this as a starting point. The latter is obviously the better.

Having set right the attitude toward the child, the nurses show the mother the details of care—bathing, dressing, adjustment of braces, and feeding. They also stand ready to give instruction in the best and most economical principles of home-keeping, and seek to become the friends and valued advisers of the families. They aim to do the best with the facilities at hand, but where it is absolutely impossible for the family to provide necessities the organization furnishes them—through the medium of the parents if possible. This is to preserve normal family relations and to prevent the estrangement which may follow when a child begins to look to outsiders for elements of daily existence which should come from his own family. Where the family can be enlisted in a new and good care of its own, there is accomplished a permanent result of the greatest value.

As to management, other things being equal, public support is desirable. It puts the expense where it belongs and leaves private philanthropy free to exert its efforts in other

Omnibus of the Association for the Aid of Crippled Children transporting children to day classes in New York city public schools.

directions; it places the work on a more permanent basis, relatively independent of changes in management and not so subject to decreases in an otherwise fluctuating income; and furthermore, it accomplishes the very excellent end of removing educational measures from a charitable category.

The problem of caring for crippled children has a national aspect in the seeming isolation of institutions. There has been very little direct exchange of experience among them. The establishment of more intimate and co-operative relations would therefore mean a positive gain.

COUNTRY BRANCH OF THE NEW YORK ORTHOPEDIC HOSPITAL.

In this institution, at White Plains, N. Y., crippled children are given industrial training aimed to render them efficient and self-supporting.

INEBRIETY: THE HAGUE RECOMMENDATIONS

CORA FRANCES STODDARD

Boston

In September, at the invitation of the Dutch government, the Thirteenth International Congress against Alcoholism, as already noted in *THE SURVEY*, met at The Hague. The addresses and discussions assumed the premise that alcoholism is in the nature of a disease and not wholly of a moral fault, and dealt largely with practical measures for its cure. The recommendations had to do with institutional treatment of hopeful cases, asylums for incurable drinkers, consultation offices like dispensaries for treatment of drinkers in their own social surroundings, the improvement of social and family influences, and the influence of a temperance organization in reclaiming the drunkard.

If the state sanctions by law the manufacture and sale of alcoholic drinks, the least it can do in return is to remove the hurtful results of its neglect and policy; this was the main contention of a paper presented from the Bielefeld society against the abuse of alcoholic drinks. The paper recommended that, if possible, patients should be persuaded to enter an inebriate home voluntarily. The system of state insurance in Germany facilitates this, as the worker is given help when unable to work. In this case, the help consists of paying the total cost of the cure, and if the patient does not belong to a sick benefit society the state gives him some support, to make it easier for him to enter the home.

Under the new German criminal code, when adopted, it will be possible for the judges to send persons who have committed offenses while intoxicated directly to an inebriate home, or, after they have served a sentence in prison, to order their further detention in a home. In this case, of course, the home must be of the "closed" type, in which the directors have the power to help drinkers against their will. Another feature of the new German law will enable relatives and municipal authorities to place the person and property of the confirmed inebriate in the charge of trustees, when it becomes evident that he cannot take proper care of them.

Several private asylums for the care of incurables have already been instituted in Germany in the Westphalia and the Rhine sections. "It is these persons," says the Bielefeld paper, "who are a severe scourge for their families and surroundings as well as for the parish which must support them, because they generally will not or cannot work, since they can find nobody who will employ them. There is, therefore, a pressing need that these should be cared for by the state, and the local parishes induced to pay the cost of their stay in such an institution—which, for the most part, will be less than what the parish grants to these incurables when they are poor, because the inebriates in such closed asylums can and must

themselves earn by their bodily labor a considerable part of the cost."

The method of treatment in inebriate homes as outlined by Dr. Seiffert and by Dr. Feldmann should be both medical and educational. Complete abstinence should be insisted upon, accompanied with attention to diet, proper physical work and exercise, baths, mental treatment, or medicinal treatment if necessary. "In education," said Dr. Feldmann, "we are concerned with two things: first, to educate the patient to voluntary abstinence as the foundation of a useful life afterwards; and, secondly, to encourage him to use all the powers he possesses which can be strengthened by education on ethical lines.

"The education in abstinence is carried on as personal work with the patient and in an atmosphere of abstinence; there is an education which comes with becoming accustomed to his duties and with the effort to conquer bodily and mental weakness."

At the last National Conference of Charities and Correction an interesting account was given of the "follow up" work of the Foxboro Institution in Massachusetts, by which the patient who has been under treatment is given supervision and help after he leaves, and especially during the transition period as he tries to take up normal life again. One feature of the work was deemed especially important; the influence which such oversight could have in securing healthful conditions in the home and helpful cooperation from the family. One of the Hague addresses, by Wilhelmina Lohman, emphasized the absolute necessity of "organized care for the family of the drinker," because "the mania for alcohol wrecks family life and seriously interferes with the training of the children. Such care should not consist of charity and giving support, as this only makes the evil greater, but should be directed to a work of redemption for the whole family life. This means bringing the completely disordered circumstances into the right way again through helping the wife as well as the husband."

A dispensary system for combating drunkenness in thickly populated centers, without removing the drunkard from his own social surroundings and daily occupations, was outlined by another speaker at the congress. Excluded from such treatment, of course, would be the cases where repeated attempts of this kind have failed or where mental disorders, diseases, or injuries make necessary a temporary stay in an inebriate home or hospital. The treatment given during visiting hours at the consultation offices should be under medical supervision and should also be of an educational nature. Co-operation should be sought with existing societies for combating intemperance, with medical institutions, physicians in private practice, courts, police, and charitable institutions of all kinds. A direct control service springing from the consultation offices themselves over the inebriates entrusted to their care was deemed necessary. It was suggested also that in addition to working

with inebriates who come for treatment, or their families, the consultation offices ought to gather as much information as possible concerning the various phases of the alcohol problem, such as heredity, different forms of the drink mania, what influence social surroundings have upon the habit, racial differences, etc.

Three conclusions are significantly common to nearly all of the papers, namely: the problem of the drunkard is not the ultimate alcohol problem but one that, since it exists, must be handled more efficiently and intelligently than heretofore; abstinence is required in any method; and education of the drinker, his family, and society at large as to the facts involved is essential.

JOTTINGS

"EITHER THE SEWAGE OR THE PUBLIC SHOULD BE KEPT OUT OF THE WATER"

The Metropolitan Sewerage Commission which was created to make plans for a system of main drainage and sewage disposal for New York along lines similar to those adopted by London, Paris, Berlin, and other great cities has submitted a preliminary report on the collection of the sewage to one central point for disposal. The essentials of the subject are given briefly, and in various appendices are forecasts of population, volumes of sewage flow, and estimates of the cost of several ways of dealing with the problem.

It has occasionally been suggested by engineers and others who have recognized the need of stopping the pollution of New York harbor that all the sewage be collected into one system of main drainage and pumped out to sea. The benefits which would accrue from this solution of the sewage problem have led the commission to give attention to its practicability. In its report the commission describes the essential engineering features of four forms of this general project. The commission declares that it is within the range of engineering ability to carry out any of them, but advises against all of them because of the tremendous cost and because they do not afford the best solution of the problem of protecting the harbor against excessive contamination.

The commission finds that the sewage of New York could be utilized for agricultural purposes and that the only land within reach which has suitable elevation and is of proper quality is Long Island. It would be feasible to collect the sewage to a central point in the vicinity of Jamaica and from there pump it to irrigation fields which would begin at Amityville, about thirty miles from New York City Hall; but again the expenditure would not be justified. The sewage of New York could be purified at one point so as to be inoffensive and without serious chance of harm to health; but this also is rejected because of its great cost.

To collect all the sewage to a central point for disposal is, the commission finds, not the only way to protect the harbor against ex-

cessive pollution. Works of less magnitude and cost can be constructed to answer all the requirements. Fundamental to the design of the needed works is the division of the city into districts, which shall coincide with the principal natural drainage areas of the land. The commission believes that the sewage should be collected and treated in each of these districts in such ways as to afford the needed protection for the near future. The design of the drainage system should be such as to fit into a more comprehensive plan when more protection becomes needed. The manner of dividing the metropolitan territory into districts and of collecting sewage in each subdivision, and the cost of disposal, will be made the subject of special reports to come later.

TO REDUCE SURGICAL OPERATIONS

In an editorial in early September under the caption, A Medical Abomination That Must be Brought to an End, the Brooklyn *Eagle* voices a sentiment regarding the division of fees between physicians and surgeons that has been receiving expression lately in other parts of the country. Using as its text a recent report made by a committee of the Medical Society of Erie county, N. Y., composed of distinguished and efficient members, disclosing the fact "that sundry surgeons who are highly remunerated split their fees with many of the physicians who send cases to surgeons for operation," the *Eagle* says in part: "The tendency of this collusion is to declare operations are necessary which are not necessary, in order to increase the money which conspiring surgeons and conspiring practitioners can divide between them, at the expense of the life or the mutilation of victimized patients and always at the expense of their pockets. For in matters protecting health and life against syndicated conspirators, against both there can be no steps backward and the disclosures to-day have kindled a fire which will not be extinguished until the abomination shall have been burnt."

Moreover, the practice of dividing fees tends to choosing surgeons who will make the most liberal terms, but who may or may not be the most capable within reach. In other words, the tendency is to make the basis of choice not ability but liberality in fee-splitting.

In May of this year the Council of the New York Academy of Medicine adopted a resolution making the secret division of a fee sufficient cause for expulsion of a member from the academy. On October 5 the academy unanimously voted to endorse the council's resolution, the full text of which is as follows:

Resolved, that the secret division of a fee, or fees, with any person, or persons, who may be instrumental in influencing a patient, or patients, to apply for operative care or professional advice is unworthy of any member of the medical profession.

Resolved, that if such a division of fee is made by a member of the New York Academy of Medicine it should be counted as of sufficient ground for the expulsion of the member.

POISON FOR PENNIES

Herbert Johnson in Philadelphia American.

keeps people HAPPY. We are interested in HAPPINESS because it keeps people HEALTHY. That is the way we want you to feel about it. Every child can learn to take care of his own health and help to keep the people around him in good health too. If health is one secret of happiness, helpfulness is another. So the things we learn we will use to help make others happy and healthy."

Each member is to receive from the company a badge and certificate, upon pledging himself to do all in his power to preserve his own bodily health, and to help the company improve the health of other policy-holders, and upon his signing the following promises:

First, I will wash my hands and face before each meal, and my mouth and teeth each morning and evening; second, as spitting is unclean and helps to spread consumption and other dangerous diseases, I will not spit upon the public streets nor in public places; third, I will not use a public drinking cup—I will use paper ones, or carry my own cup; fourth, I will destroy every house-fly I possibly can; fifth, I will never throw rubbish in the streets, as dirty streets make sick people; sixth, I will do something to help my mother every day; seventh, I will try and do at least one kind act to some one every day; eighth, I will permit no rude or offensive word to pass my mouth, even when provoked.

On the back cover of the same issue is a full-page series of pictures contrasting good and bad methods of producing and handling milk. Boys and girls who have signed the league's pledge are invited to write compositions, stories, and verses about the pictures, in competition for fifty-two prizes. The company will distribute approximately five million copies of their publication bearing this graphic health lesson.

Resolved, that the council considers it its duty to investigate charges against members made on the basis of such division of fee, and on receipt of proof of offense the council may either permit the resignation of the person or expel him from the academy.

HEALTH, HAPPINESS, AND INSURANCE

The movement among life insurance companies for health conservation continues to grow. In the November *Metropolitan*, the publication of the Metropolitan Life Insurance Company, that company announces the formation of a "Health and Happiness League" into which it hopes to enroll 500,000 children between the ages of six and fourteen who hold policies in the company. The object of the league, as suggested in its name, is found in the announcement:

"We are interested in HEALTH because it

INDUSTRY

SOME METHODS IN SAFETY ENGINEERING¹

II

GUARDING WOOD-WORKING SAWS AND CUTTERS

JOHN CALDER

GENERAL MANAGER REMINGTON TYPEWRITER WORKS, ILION, NEW YORK.

The most difficult safeguarding problems for the engineer are those relating to numerous machines used in the arts, which, after the maker and installer have carefully protected all the structural details, are essentially dangerous at the operating point, if worked at all. The variety of uses to which such apparatus is put often precludes the application of a universal guard. Nevertheless protections claiming to be of all-round use are on the market for a number of especially dangerous machines.

No such machine, however, is effectively protected by any guard which hampers a workman, reduces his speed and earnings, and which has not been designed for the actual working conditions. Such inadequate apparatus is naturally removed by the workman or wholly or partially put out of action at the first opportunity, and the particular safeguarding problem becomes the subject of a fruitless triangular controversy between the employer, the employe, and the factory inspector.

To educate the employe to use caution and foresight about dangerous machines is difficult enough and it should not be rendered more so by calling upon him to work with an impracticable safeguard. What is needed in such a case is careful inquiry, by a competent engineer experienced in the study of safeguarding problems, into the conditions under which the employe has to operate and a solution, where such is possible, which will enable him to work with efficiency and safety or at least to reduce considerably the accident risk of his occupation.

For the purpose of illustrating the problem of the especially dangerous machine, the author has confined himself to examples of accident experiences with only four out of many classes of such apparatus. These four, however, are probably the most prolific in accident to the operator when performing his usual duties. They comprise woodworking saws and cutters, punches and presses, rolling machinery of all kinds where hand-feeding is necessary, and emery and other grinding wheels.

WOODWORKING SAWS.

A close approach by the fingers of work-

men to sharp cutting tools running at a very high rate of speed is essential in operating efficiently many woodworking saws and cutters. Consider first that king of accident producers, the common circular saw, which takes an annual toll of not a few lives. This tool, the author believes, mutilates several thousands of our workmen each year and renders many of these permanently unfit for following dextrous occupations.

It is the *bête-noir* alike of employers, employes, works executives, factory inspectors, and casualty insurers. What contribution can the mechanical engineer make towards conservation in this instance? In spite of claims to the contrary such an article as a universal saw-guard does not exist on the market. On the other hand, except in the case of small diameter checking and grooving saws covered by the work, the author believes it is quite possible to safeguard all saws to varying degrees, conditioned by the uses to which they are put.

An efficient as well as a safe saw-guard is one which may have to fulfil all or any of the following conditions:

a The safeguarding must be strongly made and once adjusted must be able to retain its position and form without special care on the part of the saw operator.

b It must so protect the saw, both above and below the bench and before and behind the saw, that no one can accidentally touch or fall upon the saw.

c It must not permit the work in a ripping saw to close upon the blade, mount the same, or be projected to the danger of those around.

d It must not obscure the workman's vision of the line of the saw.

e It must be especially adapted to the class of work done on the saw bench and, where required, it must leave all the area of the saw table clear of obstruction and also the space above the guard itself.

The ways in which these conditions for reducing saw accidents, while maintaining efficiency, have been met in the author's experience are illustrated in Fig. 1 and in Figs. 2 to 9 for various kinds of saws and applications of such, from the handling of the rough log to completely converted lumber.

Fig. 8 shows in some detail the solution of a circular-saw protection problem where the conditions were supposed by workmen and foremen alike to forbid safeguarding which would permit the machines to be worked at full efficiency. The saw-bench illus-

¹From the *Journal of the American Society of Mechanical Engineers*. In THE SURVEY for October 21, 1911, was printed Mr. Calder's discussion of guards for transmission machinery; other especially dangerous machines will be taken up in a later issue.

GUARDS FOR WOOD-WORKING.

- 1 Automatic-positioning mesh guard for variable diameter converting saw.
- 2 Automatic-positioning bar guard for variable diameter converting saw.
- 3 Adjustable shield guard for variable diameter converting saw.
- 4 Spar guard for log saw.
- 5 Mesh guard for constant diameter overhung saw requiring clear bench for sliding table feed.
- 6 Mesh guard for constant diameter saw requiring clear bench for lumber.
- 7 Adjustable mesh guard for swing saw and belt.
- 8 Guarded triple-saw, slide-feed bench with clear tables.
- 9 Band saw guard against contact at any part and also against saw breakage.
- 10 Adjustable jointer guard.
- 11 Telescopic jointer guard.
- 12 Automatic-positioning jointer guard.
- 13 Spindle molder screen guard, thin work.
- 14 Spindle molder screen guard, thick work.
- 15 Spindle molder cage guard.

trated is a combination trimmer and edger having three saws on one shaft.

The over-hung saws, a rip and a cross-cut respectively, are fixed in position on the shaft ends, but the middle cross-cutting saw must, with any guard, traverse the shaft freely when required for a distance of eighteen inches. The work handled varies from one to three thicknesses, totalling two inches, and is fed into the saws on two sliding tables of twenty-nine-inch stroke and of fixed and variable gauge respectively. Thus no attachment above the bench for any guard is possible at the front or sides or for about the above named distance to the rear of the saw.

No purchaseable guard will meet such conditions. As finally worked out, the rip-saw has a safety parting-knife fitted in its rear, and all three saws are efficiently and strongly guarded, as shown, at every dangerous point. Men working at a rapid pace on task work at these benches are highly pleased with the result. They are able to use the three saws more effectively than before and without any fear of injury. The saw line is always visible through the mesh-work and pierced work, yet the operators' hands, which necessarily travel with the work, can never approach the saw teeth too closely, as they are pushed off by the projecting fingers.

WOODWORKING CUTTERS.

The common jointer accounts for a large number of finger and hand amputations every year. Figs. 10, 11, and 12 show three forms of effective guard. In the first and third, two movements, vertical and horizontal respectively, are necessary to adapt the guard to any given piece of work. In the second, the guard supported on springs rises automatically when pushed by the work and only the transverse sliding motion is necessary for positioning. After the work has passed the guard the latter returns automatically to a position close to the cutter gap. In the other two types the guards maintain their height above the table until readjusted. All these guards can be readily swung out of the way for cutter adjustments and as easily returned for use.

The vertical spindle molding cutters can also inflict serious injuries. Sometimes a leather knuckle-duster revolves with the tool and contact with it warns the workman of too close approach. Figs. 13, 14, and 15 show three forms of more positive safeguarding for this dangerous tool.

ARE LAKE STEAMERS "SLOCUMS?"

The following paragraph from the report of the federal commission which investigated the *Slocum* disaster, in which over a thousand men, women, and children were killed in June, 1904, should be read in gauging the significance of the charges made by the Chicago Federation of Labor with respect to passenger steamers on the Great Lakes:

"The deckhands are apparently picked up with very little consideration as to knowl-

edge of their duties, have very little discipline, change from year to year (only one of the *Slocum's* deckhands having been on the vessel before this year), and are unfitted to meet any such emergency as was presented by the disaster to the *General Slocum*, or properly to take care of such peculiarly dangerous traffic as that on excursion boats."

The inefficiency and poor quality of the deck crew of this vessel, doubtless typical of the majority of the crews on excursion steamers, is one of the essential facts that caused the loss of so many lives.

The Chicago report is published in full in the *Coast Seaman's Journal*. It describes crews on twenty-four passenger boats sailing out of Chicago as follows:

One master or captain, and two licensed mates.

Three to six experienced seamen called quartermasters, or wheelmen, watchmen (not "cabin watchmen"), and lookoutsmen.

Usually from two to eight "scrubbers." These men or boys are not sailors, are not required to have any experience; the only qualification needed to secure employment in these positions is a willingness to handle a scrub brush.

Four to thirty deckhands. No experience of any kind is needed to obtain employment in these positions. In most cases the deckhands are merely freight-handlers. The majority of those interviewed were "down and outs," working only a week or so at a time on the boats.

Engine department crew, consisting usually of two licensed engineers, two oilers, and from two to four firemen.

Steward's department, consisting of from six to 125 persons, none of whom are sailors. This department consists of cooks and helpers, pantry boys, waiters, porters, bellboys, cabin watchmen, chambermaids, bartenders, news and cigar stand attendants, etc.

"We find," the report goes on, "that the average crew of experienced seaman on each steamer, exclusive of the captain and two mates, is five. These five seamen are the two quartermasters or wheelmen, two watchmen on most of the steamers, and one lookoutsman.

"On a passenger steamer employing two quartermasters, two watchmen, and two lookoutsmen, a total of six experienced seamen, the watch on deck consists of one man of each grade, a total of three such experienced seamen. One of these, the quartermaster, is at the wheel in the pilot house or on the steamer's bridge, steering the ship, and is not available for any other work. The watchman is stationed on the freight deck and would only know of anything dangerous on the passenger decks through hearing the official signal or alarm. The lookoutsman is usually stationed at the extreme forward end of the steamer, and he is the only available man to whom the officer in charge of the vessel could personally communicate a sudden direct order to perform emergency service on deck. In cases where

only one lookoutsman is employed, who then stands watch only at night, the officer in charge must, during the day, wait until the watchman comes to him from the freight deck in response to a signal. The law itself permits this condition of affairs.

"It will be noticed from this that not one of the twenty-four passenger steamers ever has on watch at one time sufficient experienced seamen to launch and man even one lifeboat. No experienced seamen could be found on the passenger decks, except, at times, a lookoutsman stationed in the bow of the ship.

"Such few experienced sailors as are employed on board these steamers are each placed in charge of a lifeboat, with cooks, waiters, bellboys, deckhands, or freight handlers as crews and there are not even enough able seamen on board these steamers to place even one such man in each lifeboat."

The fire and boat drill practiced in these boats the federation denounces as of no value:

"The fire drill consists of pulling down the hose and opening a valve. The calling of the fire drill serves as a notice for boat drill. Boat drill consists of lifting from one to three lifeboats and swinging them out. It is not required that lifeboats be launched into the water with crews in place during boat drill—and without this being done the drill is very nearly useless. The men are given no practice whatever in handling lifeboats in the water, or other life saving apparatus."

In its editorial comment on this report the *Journal* urges legislation requiring experienced crews on lake and other vessels. The bill which has been introduced into Congress in several successive sessions and which will be brought in again this winter by the Seamen's Union (H. R. 11372 of the sixty-first Congress) would require that 75 per cent of a crew be able seamen.

The Seamen's Union has been on strike for three years against the Lake Carriers' Association, and the union officials claim that the present condition on the lakes is due to the use of casual laborers.

BAKE-SHOP RULES

The following tentative rules drawn up by the Wisconsin Industrial Commission have been adopted *in toto* by the Master Bakers' Association of the state. The commission invites criticism and suggestions and reserves the right to modify the requirements when special conditions demand changes in order to attain the sanitary standard they desire to attain in this trade. A digest of the rules follows:

1. If there is a public drain extending along any street or alley in which a bakery is located, the bakery must be connected.

2. If there is no public sewer or drain, a drain must be provided to a cesspool or other receptacle, located at least thirty feet away from the bakery; provided that if such drain empties into a running stream or lake, the limitation as to distance shall not apply.

3. All plumbing must meet the legal requirements; but in all cases water fixtures

shall be back-vented or equipped with anti-siphon traps.

4. Waste water shall not be drained directly on the ground below the floor or on the surface of the ground adjacent to the bakery.

5. Sewers running through any bakery shall be so securely and completely bedded as to prevent the escape of water, sewage, or gas, and must be subject to a test of at least two feet of water or twenty-five pounds of air pressure.

6. No drain is permitted nearer than eighteen inches to any water pipe.

77. No pan, hopper, or plunger water-closet shall be put into any bakery hereafter established, and all such closets now in use must be replaced, when worn out or filthy, with tank flushed siphon closets, properly trapped and ventilated.

78. All water-closets and urinals in bakeries must be fully enclosed and provided with self-closing doors. All closets and urinals shall be provided with a window to the outer air, if possible; if such window cannot be constructed, closets and urinals must be connected with a ventilating flue providing a continuous current out of the closet into the open air.

79. In places where it is not possible to have sanitary conveniences in bakeries on account of local conditions, privies with vaults may be maintained. Such privies must be located at least thirty feet from the bakery, and must be screened.

87. In bakeries where eight or nine persons are employed separate sanitary conveniences must be provided for females. At least one such convenience shall be provided for every twenty-five females or fraction thereof, for males in the same proportion up to 100, then one for every forty.

It may be noted that there is no provision that water-closets shall not open into bake-rooms, nor is there any requirement for facilities for cleanliness, or any regulation tending to limit the use of cellars as bakeries.

JOTTINGS

STANDARDS IN ACCIDENT REPORTING

The Committee on Standard of the American Association for Labor Legislation is sending out for criticism and suggestion its tentative schedule for uniform reporting of industrial accidents. It solicits the co-operation of all who have information on this subject in the task of drawing up its final schedule. A copy can be obtained from the following persons, members of the committee:

Leonard W. Hatch, New York Department of Labor, chairman; Lucian W. Chaney, United States Bureau of Labor; John R. Commons, Industrial Commission of Wisconsin; Don. D. Leschier, Minnesota State Bureau of Labor; John B. Andrews, secretary American Association for Labor Legislation, 1 Madison Avenue, New York.

The committee will make its full report at the meeting of the Association for Labor Legislation in Washington, December 27.

BRITISH REPORT FOR AMERICAN READERS

In *Bulletin 93* the Department of Commerce and Labor has made the essential facts in the recent report of the British Board of Trade on the Cost of Living in Europe and America available for American readers. The resumé, which digests in seventy pages the British report of 533 folio pages, should be useful not only to those wishing to get a general view of the report, but to introduce the subjects covered to those wishing to make a thorough study of the British investigation. Publication 93 contains also facts regarding the hours of labor of Austrian factory workers, a digest of recent foreign statistical publications, and recent decisions of American courts affecting labor.

BUFFALO TRADES UNIONS AND TUBERCULOSIS

A booklet issued by the Buffalo Association for the Relief and Control of Tuberculosis tells of the organization of a Trades Union Section of the association. About sixty unions are at present affiliated, electing delegates to a central body. The purpose of the organization is to do "everything in its power to prevent the spread of tuberculosis among the well, and to care for the sick among its own members. Through organized effort, and its affiliation with the parent association, it will work for more and better hospital facilities for the care of the sufferers, and for improved public health agencies of all kinds in city, county, and state, and to arrange that its members have proper sanatorium treatment whenever possible. It will work for improved sanitary and hygienic conditions in factories and all places of employment. It will through meetings, lectures, and printed matter, carry on an educational campaign among the organized workers of the city."

One of the pioneers among trade unions in work for tuberculosis is the International Typographical Union, whose 700 locals have long co-operated with local anti-tuberculosis committees, have carried on an educational campaign among their membership, and have enforced sanitary conditions in union shops. Their sanatorium, founded in 1892, has spread from a single building to a group of buildings, which with the surrounding property are worth a million dollars. In this settlement care is provided for tubercular printers, and also for those aged members of the union who prefer institutional care to the weekly pension of \$5 to which all members of twenty years' standing who have reached the age of sixty are eligible.

A MASTER PLUMBER'S MUTUAL

In their effort to keep premiums low, the New England Mutual Fire Insurance Companies have, by confining their risks to buildings properly built, protected, and occupied, largely eliminated the fire hazard in the factories of their members. A system that works with fire may be turned to account in accident insurance, and it is interesting to learn from the *Metal Worker* that, influenced by the practically compulsory feature in the new

state compensation law, the master plumbers of Wisconsin have taken the initial steps toward forming a mutual liability insurance society. This is said to be the first venture of its kind on a large scale in the plumbing field.

ON A PAY ENVELOPE

This is the inscription on the pay envelope of the Lorraine Company, a Rhode Island firm interested in preserving the health of its employes:

WILL YOU HELP TO PREVENT TUBERCULOSIS?

It kills 1,000 people yearly in Rhode Island.
It is spread by Careless Spitting.
It can be cured if taken in time.
It can be prevented in nearly all cases.
Do not neglect a Cough. Consult a Physician.
Sleep with the Windows Open.
If you think you have Tuberculosis,
Notify the Overseer, and the Lorraine
Manufacturing Co. will help you.

LABOR NEWS LETTER

The weekly *News Letter* of the American Federation of Labor, issued by instruction of the delegates attending the last annual convention, is designed to furnish the affiliated labor periodicals throughout the country with current notes on the labor movement from the trade union point of view, and with the news of important events directly or indirectly connected with labor throughout the world.

Among other items last month's letters record the opening of the strike of the shopmen on the Harriman lines, boilermakers, carworkers, blacksmiths, sheetmetal workers, and machinists all voting to come out, the latter in spite of the adverse decision of the president of their organization. Later the strike spread to trainmen and conductors. The demand is for recognition of the federation of shopmen's unions.

—On the eve of his trial the International Bridge and Structural Iron Workers' Union has re-elected J. J. McNamara general secretary-treasurer of its organization.

—After six weeks' strike the ladies' tailors of New York have come to a settlement with the Employers' Association which is a compromise agreement on their original demands. The agreement secures the journeymen tailors shorter hours, increased pay, fixed pay-day and cash payments, some regulation of over-time, Sunday and home work, a certain degree of union recognition, and steps toward establishing a sanitary board.

—President Mahon in his annual report to Amalgamated Association of Street and Electric Railway Employes of America states that: "During the term there has not been a single reduction of wages anywhere; while upon the other hand 138 divisions have received increases in wages varying from one-

half cent to ten cents an hour, and twenty of these divisions have had the second increase during the term. The wage increase affects 42,491 of our members and amounts annually to \$2,356,900. The average per member for the year is \$55.46."

—According to President O'Connell's report members of the International Association of Machinists have engaged in 152 strikes. They are now striking at forty different points for increases in wages, reductions in the hours of labor, and better shop conditions. In two years the general office has paid in strike benefits over a million dollars. In death benefits it has spent \$93,325, and its local unions have paid, on a conservative estimate, \$100,000 for sick benefits.

SAFETY AND THE MACHINE BUILDER

A Wisconsin builder, while approving state legislation compelling employers to install safety devices, suggests that the persons on whom compulsion should be used are the manufacturers of machinery. This, he points out, would save the manufacturers the expense of practically rebuilding parts of their machines. It is to be noted that some of the largest machine purchasers have safety standards which they demand as a matter of routine in securing new equipment, and let be known among the sales agents of machine supply companies that safety elements in machine construction will be taken into account in placing orders. The margin of profit on travelling cranes, for example, is so small that, unless specified, protection devices are not customarily built into them; only the purchaser who demands them is sure of getting them. The *Metal Worker* suggests that a compulsory safety law such as that before the last Wisconsin Legislature would automatically give the advantage in competition to the manufacturer of machinery who designs with a view to safety.

RESISTANCE TO MINIMUM WAGES

The efforts made at Cradley Heath to postpone the operation of the new scale of wages imposed by the British Minimum Wage Boards¹ are being closely paralleled in the lace industry, the second trade for which a scale was arranged. At Nottingham, the home of lace-making, the more unscrupulous firms are taking advantage of a contract clause in the board's award to postpone the new scale of wages. Under threats of dismissal workers are being asked by middlewomen—forewomen who, it is believed, expect in this way to earn an advance in wages themselves—to contract out for six months at less than the legal minimum of 2 3-4 d. per hour. For refusal to agree to this proposition several hundred women have been locked out. The National Federation of Women Workers, to which the lace-workers belong, and the National Anti-Sweating League have addressed a public appeal for funds, signed by Lord Henry Bentinck, M. P., and others, to support the locked-out women.

¹See THE SURVEY, September 23, 1911.

W. T. U. L. COURSES

The Women's Trade Union League of New York, encouraged by the success of its last year's classes in music, English, and social subjects, is offering a fuller educational program for this winter. The musical course covers classes in sight singing, voice production, and chorus. A course in parliamentary law will give training in carrying on the business of an organization. Courses in debating and in English, the latter especially for foreigners, will be offered, designed to increase the pupil's power of self-expression and orderly thinking. Through the class in English, the more elementary facts about modern industry will be taught, some of the subjects of the lessons being: Looking for Work, Learning a Trade, a Trade With a Union, Factory Laws. More advanced instruction on the subject of modern industry, with special emphasis on the position of women in this field, will be given in a series of half-hour talks on social subjects, economics, the labor movement, and trade unions. These talks, the first popular presentation of sociological subjects, have already been prepared in pamphlet form by James Dealy of Brown University, Charles Beard of Columbia University, and Jessica Linch. Beginning in January there will also be given a course of twelve lectures on American government and politics, constitutional rights and police power, and labor legislation in Europe and America.

TO PROTECT RESTAURANT WORKERS

A recent issue of the *American City* reprints a paper read at the last meeting of the American Public Health Association by Charles B. Ball, chief of the Bureau of Sanitation of Chicago, whose work for improving the condition of Chicago bakeries is well known. It lays down a model set of regulations for bakeries and restaurant kitchens. Mr. Ball deplors the growing tendency toward cellar occupation, but believes that pure food legislation can be used to obstruct it. Pure food is to be the excuse, the protection of the health and lives of those who are forced to labor in unsanitary places the real motive of sanitary improvement. He suggests the following regulations for bakeries: the floor to be above the ground level; lighting and ventilation to be from at least three sides; floors to be rat- and moisture-proof, monolithic to be preferred to wooden floors; wall and ceiling finish to be of hard, smooth, cement plaster; and furniture to be movable, to allow easy and frequent cleaning. For restaurants, whose present kitchen accommodations he calls "foul catacombs," he recommends in addition to the above requirements: an ample space requirement; an arrangement of appliances that shall insure the separation of garbage and dish-washing from food; adequate provision for the removal of cooking odors; ample and isolated toilets, washrooms, and lockers, and well-ventilated refrigerators, with separate compartments for different classes of food.

CRIME AND ITS CURE

ISABEL C. BARROWS, Contributing Editor

YOUNG CRIMINALS IN THE NEBRASKA STATE PENITENTIARY¹

LUTHER E. WIDEN

A little over 30 per cent of the convictions in Nebraska during the past forty years resulting in the serving of terms in the state penitentiary, at Lincoln, concerned individuals who were twenty-two years old or younger at the time of their conviction. As the writer moved from cell to cell and galley to galley talking to some of these youths, knowing that their average time behind the walls was less than two years, the question came forcibly: What is being done to help these boys to withstand temptation when they are given their freedom?

The penitentiary has two cell houses for men, well ventilated, equipped with modern sanitary appliances, and electrically lighted. The prison for women is above the chapel. The prison shops—contract labor is employed in making shirts and brooms—the hospital, greenhouse, electrical and heating plant, a branch kitchen, and tailor shop are back of the long cell houses and surrounded by the customary high wall. Barns, an orchard, gardens, and fields surround the walls.

The institution was opened to receive convicts July 28, 1870, when twenty-three men were admitted. During the following period of forty years, over 5500 men and boys have been committed, and of this number two-thirds were from fourteen to thirty years of age at the time of their commitment. The length of sentence has varied from one day in two cases to life in approximately one hundred cases. In numerous instances the death penalty has been exacted.

It was not till July, 1881, that the State Reform School was opened at Kearney to receive boys and girls under the age of sixteen, who were "growing up in mendicancy and crime for want of proper parental care or other cause." It took eleven years from the opening of the penitentiary to have established a separate institution for juvenile delinquents, and eleven more years elapsed before boys and girls were provided for in distinct institutions.

In the spring of 1893 a legislation investiga-

¹This is an abstract of a study made by the writer while a student in the Department of Sociology at the University of Nebraska, 1909-1910.

tion was held on account of the death of a convict from causes growing out of the inhuman method of punishment in the penitentiary. Among other recommendations were the following:

The contract labor system should be done away with at the earliest possible moment. The pay of the guards and other minor officials at the penitentiary should be increased. How can it be expected that convicts will be reformed while under the care of men who are almost if not quite as lacking as they in moral principles? The wiser economy would be to increase the compensation and secure the services of men better qualified to fill the places. Your committee believes that the system of confining young convicts, under sentence for the first time, with the older and hardened criminals is wrong in principle and unwise in practice. We believe that every endeavor should be made to reform the young criminals and to lead them to live moral and upright lives, but all efforts in that direction will be thwarted while such young criminals are permitted to associate with men who have led criminal careers during their whole lives; and we therefore recommend that suitable arrangements be made by the officials in charge to classify and separate the older and more hardened criminals from those less vicious. Your committee believes that some provisions should be made whereby the ignorant convicts, as also those who may desire further educational advantages, may be taught such branches as are taught in the common schools of the state; and to that end we believe that a night school should be held not less than two evenings in each week, which all those convicts who can not read and write should be required to attend for instruction in the common school studies.

What a different institution we should have to-day if these recommendations had been followed! But the contract system still exists, the guards and other minor officials are only half paid. The first offender is thrown in with the vicious. Moreover, there is not a country school in the state less systematically conducted than the present prison school.

Two boys of fourteen and sixteen boys of fifteen years of age have been committed to this prison. Of the 66 2-3 per cent from fourteen to thirty years of age, 17 per cent are under twenty, and a little over 45 per cent, nearly one-third of the total prison number,

are twenty-two years of age or less. More than ten times as many youths of twenty-two are received as men of forty-five. To one man between forty-eight and fifty-eight, fifteen boys are received between the ages of eighteen and twenty-eight. More boys between the ages of nineteen and twenty-six are received than men of all the ages after twenty-six. More boys from fourteen to seventeen inclusive have been received than men over fifty up to seventy-four. The average age of the Nebraska convict is a fraction over twenty-eight years, the degree of variability being much larger above than below this figure.

It may be worth while to give a few of the quotations concerning these younger convicts. In the third biennial report, 1873-1874, the warden says:

It is impossible to overestimate the moral injury inflicted on the young in years by having them thrust indiscriminately into the same room with older and hardened criminals.

He urges the need of separate cells. Chaplain Harris in his report in 1878 says:

I have become especially interested in some of the younger convicts. In many instances they are capable of being made very much of, but situated as they are among those who have been hardened in crime, their reformation is a matter of great doubt and difficulty. Their only salvation is to be removed at once to a reformatory school of some kind, and to be surrounded by better influences than are now possible. Many of them are as yet mere boys, wholly uneducated, and without a trade for their future support.

The Rev. P. W. Howe's long experience as prison chaplain afforded him a rare opportunity to become familiar with the needs and abuses of the penitentiary system. In his report, November 30, 1890, he says:

A person of ordinary comprehension can well understand that the placing of the young man who has committed his first offence in constant association with the hardened and abandoned criminal will inevitably lead to the worst possible result. As I understand it, we should, if possible, turn out a better man than we took in. Under our present system we are almost certain to turn out a worse man. That our prisons should be reformatory the best interests of society clearly demonstrate.

A statistical study from the prison record for the period from 1903 to 1909 inclusive brings out the following facts concerning the boys who were twenty-two years of age or younger at the time of their commitment. Three hundred and sixty-six individuals are

included in this summary study, representing 26.5 per cent of the total population received during the period. On January 1, 1910, nearly one-fourth of these young men were still confined, just one-half of these, however, having been received during the year preceding, 1909.

Thirty-three per cent of all the commitments were from Douglas county, of which Omaha is, the county seat, a county which represents a proportionate population just one-half as large. On the other hand, Lancaster county, of which the state capital, Lincoln, is the county seat, figures a proportionate number of convictions according to population, both figures being about 6 per cent.

Eleven per cent of these 366 cases were foreign-born. Seventy per cent were born in the north central states, nearly one-fourth in Nebraska. Thirty-six states and territories and sixteen different foreign countries are represented as birth-places.

Forty-two statutory crimes were recorded against these unfortunates, ranging in degree from seven cases of first degree murder to single instances of receiving stolen property, selling mortgaged property, larceny as bailee, sending threatening letter, etc. The crimes against property constitute 85 per cent of the cases, and one-half of these were burglary and horse-stealing.

These figures do not show any apparent variation in the ages of those convicted for crimes against property and those convicted of crimes against persons. But the age average is higher for larceny from person, that is pick-pocketing, than it is for burglary and horse-stealing.

Nearly one hundred different occupations were given by these youths as having been followed before their incarceration:

Thirty per cent were common laborers, 16 per cent were farmers, 6 per cent were waiters, 3 per cent were butchers, and 3 per cent were cooks. These were the most common.

The tendency of the judges is to give these young men the minimum sentence.

One hundred and forty-five of the 366 were sentenced to one year, which means only ten months, since practically all shorten their terms by two months by making so-called "good time." Eight were sentenced to one and one-fourth years, and thirty-five to one and one-half. Fifty-eight were "sent over" for two years, and as these young men spend as a rule only one year and eight months in prison, deducting their good time and assuming that they are not paroled after serving one year, it is readily seen that 68 per cent spend less than two years behind the bars. Ten of the commitments were for life. One boy of fifteen and seventeen of seventeen years of age were received during this seven-year period.

The most interesting part of this study is,

perhaps, that which the boys themselves contributed. A questionnaire asking some eighty questions was prepared. The prisoners were, without exception, courteous. One or two showed indifference, but as a rule they displayed unusual interest in the investigation. The questionnaires were given to those inmates who had entered the prison when they were twenty-two years of age or younger. Approximately 4,000 questions answered by fifty individuals were selected for statistical tabulation.

With one exception each of them knew the exact date of his birth. Sixteen per cent of these men were under eighteen at the time of their conviction. Only three of the boys hailed from the other side of the Atlantic, these coming from England, Denmark, and Sweden; two were born in Canada, and the remaining forty-five in the United States. Sixteen mothers and fourteen fathers were foreign born. Not a single parent was a native of Nebraska. The average size of the family, including parents, was nearly seven members. In fifteen cases there were from seven to ten children. In twenty-three cases both parents were still living, four of them, however, not living together. Twenty had lost their fathers and fourteen their mothers. Twelve of the boys were under ten when their fathers died; six were likewise under ten when their mothers died. Five had lost both parents before they were eight years old.

Several questions were submitted to determine the age at which schooling, if any, began; the age upon leaving school; the grade attained; and the reason for leaving school.

Only two had never attended school. The average age of entering school was six years; the average age for leaving, fifteen. The average time of attendance was, however, much less than nine years.

Three questions were given to ascertain the number of jobs held before conviction, and how many had had a trade, and how many had joined a labor union.

Fourteen had had so many different jobs they could not remember the number. Twenty-eight said they had learned some trade in whole or in part. However, the word "trade" was confused several times with manual labor or menial service. Only five had membership in labor unions.

It is generally contended that criminals are of a non-social type. A question bearing on this matter resulted in answers showing that one-half had never belonged to any organization whatever. Twenty claimed membership in seven or eight different religious organizations. Only four had joined secret societies.

Just one-half said that they had never been

arrested as boys. Only three admitted having worked off a fine, eight had served jail sentences, eight had served time in industrial schools for boys, two had paid fines, and one had already served a short penitentiary sentence in another state. Thirty-two had never before served sentences for crimes or misdemeanors. Twenty-one admitted that they had been drunk. Fifteen drank at times, and fourteen were, presumably, total abstainers.

Most of the boys appeared to be in good health, but about 40 per cent had some complaint to make.

Eighteen per cent admitted having suffered from venereal infections. One suffered from rheumatism, another from tuberculosis, a third from bad blood.

"Did you get justice when convicted? Did you plead guilty? Are you guilty of what you were convicted for?" In answer to these questions the boys showed a great deal of unexpected interest.

Forty per cent admitted getting justice, but only one of these had committed a crime against person, namely wife abandonment. All of those convicted of murder or manslaughter denied receiving justice. Eighteen convicted for property crimes claimed that justice had not been dealt out to them.

In spite of the fact that such a large proportion plead guilty, two-thirds of them spent more than a month in jail. The average time spent in jail was sixty-six days. It is evident, therefore, that the young men who are sentenced to the penitentiary have neither means at their disposal nor friends or relatives who are in a position to assist them in their trouble. It was found that the average time spent in the county jail by those charged with property crimes was fifty-three days. The time spent in this way has an important bearing upon the hardening process in these young, pliable characters. The average county jail is infested with the crime-breeding germs of idleness and vulgarity at least, not to say of social diseases, filth, and immoral practices. Even those boys who plead guilty served a significant sentence in the county jail, the average being fifty-seven days.

Eighteen boys had run away from home, and thirteen of these claimed that their relatives did not know that they were in prison. In answering the question, "To whom do you write?" sixteen specified their mothers, six their fathers, seven their relatives, five their friends, three their sisters, and three their brothers. Three wrote to their wives and one to his foster-parents. Nine wrote to absolutely no one.

That the apparently easy, shiftless life of

the tramp often leads to crime and a prison sentence is evidenced by the fact that

twenty-six of these fifty boys admitted having bummed their way in travelling. Twenty of these had at some time classed themselves as ordinary tramps. Sixty per cent claimed that they had travelled a great deal.

"Whose fault is it and what caused you to be here?"

Thirty of the boys attributed their waywardness to their own mistakes in greater or less degree. "Errare est humanum" was the classical answer of one of the younger prisoners. In ten cases "my own, by whiskey," or similar answers, were given. Gambling was mentioned once, and so was cocaine. Thirteen boys placed the blame on their evil associates. Six of the boys centered the cause of their downfall in their economic conditions before or after the crime was committed.

Tobacco was used by 80 per cent of the boys at the time the questions were submitted. Only three boys had never used it in any form before or during incarceration; five had not used it before going to prison.

In reference to their prison treatment the boys were not given to complaining. The few grudges that were noted in the answers were usually directed towards the guards.

Three-fourths of these young men referred to their treatment as being "O. K." Others complained of mistreatment.

"What do you like about the prison system?" was answered in various ways.

"Nothing," said eighteen. "Don't have to wear stripes," "working system," "library and school system," "parole and pardon laws," "modern cell house," "regularity of meals and sleeping rules," "visitors and warden," were other answers. The negative of the foregoing question, "What don't you like about it?" was answered by seven in one word, "Everything." The food was condemned by ten, contract labor by two, exercise by two, close confinement by six. One said that the prison system would be better if stricter, because too much partiality was shown to certain prisoners. Another appreciated the evil effects of mixing indiscriminately persons of all ages and crimes. Two criticized the moral standards of the guards.

Suggestions as to how matters could be improved were mostly specific.

Twelve urged better food, ten wanted to be allowed the freedom of the prison yard on Sundays, and eight suggested the employment of better and more moral men as guards. One made the suggestion, "Give us chance to earn and save a little money." Two recognized the advantages of keeping boys out of cells in which prisoners of vicious character were confined. Other suggestions were "grade convicts," "improve sanitation," "better wages to guards to induce better men to stay here."

The evil influences in prison given the most emphasis were the associations with hardened criminals and their stories of crime. About one-third of the boys referred to these.

Only two of the fifty boys had lost good time for some infringement of the prison rules. This practice, established by statute, of giving two months of the first and second years, three months of the third year, and four months of the fourth and additional years of sentence, for good behaviour, is a most important factor in maintaining discipline. One of the boys complained that the Nebraska law was not as liberal in this respect as some other state laws, and another thought that "the best should have a chance to earn more good time." Two men who had long sentences, twenty and twenty-two years respectively, had reason to believe that the indeterminate sentence law, which has not as yet been added to Nebraska's code, would be better than this so-called good-time law.

Prison officials usually realize the great dangers of sexual vice in prison and the debauching influence of the older men on the young boys when allowed to cell together. A convict is not in prison long before he learns of the revolting sex crimes practiced by perverted human beings. This is, no doubt, one of the most serious and difficult problems confronting the prison management and is a strong argument for the separate system. Sixty per cent of the boys answered in the affirmative to the question, "Do you think there is a great deal of sexual vice in here?"

All but two liked the weekly chapel exercises on Sunday morning. Only eleven of the boys attended the prison school. Two of them sang in the choir, and one played the cornet in the orchestra.

Perhaps one would venture to say that, as a whole, the answers were optimistic, considering the circumstances under which they were written. While this is a measure true one can not but feel the strong undercurrent of dissatisfaction. Again, many of these boys would be willing to say things they would not commit to paper. They feel keenly the contributory responsibility of others for their crime, their own weakness to combat evil influence upon their release because of the attitude of society and the majority of the servants of society toward the ex-convict. They are members of a large unorganized army, so they would have it, and their organized foe, the unit of which is the average American citizen, is, unconsciously, ever ready

to drive them back into accustomed haunts and nefarious practices.

One would naturally expect dissatisfaction to reign over the inmates of a prison. From the nature of things this must be true even in a model institution. And while there is no absolute panacea, no perfect system devisable whereby all delinquents may be reformed for social assimilation, there is great hope in those institutions where the problem is not only understood but dealt with by means of precedents that are tried and true. Reformatory ideals should be introduced into all correctional institutions. In the January, 1910, issue of the *American Journal of Sociology*, Z. R. Brockway discusses the principles of the American reformatory prison system. He says that it

is based on the principle of protection in place of punishment; on the principle of the indeterminate sentence instead of the usual time sentence; and on the purpose of rehabilitation of offenders rather than their restraint by intimidation.

BACK TO SING SING

With the removal by Governor Dix of four of the five members of the State Commission on New Prisons, and the resignation of the fifth, a further chapter has been written in the story of New York's attempt to get a new prison. Four years ago the commission made its selection of the Wingdale site, consisting of 500 acres of land lying on the west bank of the Hudson river, about forty-two miles from New York. The selection was approved by the State Commission of Prisons and Governor Hughes. Later, just before Governor Dix assumed his duties, the State Commission on New Prisons awarded the contract for the construction of the new prison, which was planned to take the place of Sing Sing, to the P. J. Carlin Construction Company of New York. This company began work.

As a result of investigations conducted by Governor Dix, Superintendent Scott, and the State Prison Commission, the permanent body charged with supervision of New York penal institutions—the personnel of which had undergone changes under the present Democratic administration—Governor Dix caused negotiations to be started with the Carlin company for the abrogation of its contract. The project has been abandoned and instead steps are to be taken to improve the equipment of Sing Sing.

Concerning the changed program, Joseph F. Scott, formerly superintendent of Elmira Reformatory and since this year superintendent of the State Prison Department, writes:

"There has been paid from the state

treasury at the present time for the Bear Mountain and Wingdale work upwards of \$400,000. The contract with the Carlin Brothers amounts to \$2,200,000. Their original bid was \$2,900,000, but six buildings were eliminated to bring the amount down to that authorized by the legislature. I do not believe that six buildings can be built for less than Carlin's original bids. With what has already been expended, this would amount to \$3,300,000. It will then be necessary to provide the prison with water works and sewerage disposal plant, and grade the grounds, the cost of which I approximate at \$200,000. This would bring the complete cost of Wingdale up to \$3,500,000 for the bare buildings, without equipment. The soil of the site is low, and one end marshy. The basement floors of all the buildings except the cell block and administration buildings would be seven feet above high-water mark of the swamp river. Many of the foundations go much below the high-water mark of the river.

"Of course there are no unfavorable conditions at Wingdale that could not be overcome, but the expense over that of a properly selected site would be considerable. I believe also that the water supply would be inadequate. Before the fall rains set in all of the water in the brook which would furnish the reservoirs was passing through a three-inch pipe put in by the contractors for construction work, and the rest of the brook was dry.

"I do not believe that the location of Sing Sing prison is an unhealthy one. A new cell block could be constructed there to do away with the old one, in which the cells are altogether too small, and could be constructed by prison labor. The present cell building could be stripped of its cells and converted into a factory building, which would be exceedingly serviceable. I believe \$1,000,000 would construct a new cell block at Sing Sing and leave enough money to put all of the other buildings in good condition. While the prison would not be as good as a new prison at Wingdale, it would cost \$2,000,000 less, and would be adequate to our present needs.

"It should be taken into consideration also that the prison at Great Meadows has been started since the Bear Mountain and Wingdale projects were inaugurated. There are already 600 cells completed at Great Meadow prison. The plans call for 600 more. This would give a cell capacity at Great Meadow of 1,200. There are 1,200 cells at Clinton, 1,200 at Auburn, and 1,200 at Sing Sing, making a total of 4,800, which would provide for a prison capacity of about 5,000 people in all four prisons, taking into consideration the number that are in the hospitals, etc.

"We have at the present time a total population in the four prisons of 4,375 male prisoners. The commitments of male prisoners to the state prisons for the past four years were as follows: 1908, 1,633; 1909, 1,627; 1910, 1,512; 1911, 1,368."

There have been charges that the abandonment of the Wingdale site let the construction firm out of an unprofitable contract, but these have not been generally credited among public-spirited people interested in prison matters in New York state. Opinion seems to be in support of the present prison administration in abandoning the Wingdale site as ill-adapted to institutional uses. It has been rumored that the "scientific method of elimination" by which the site was ostensibly chosen was used to cover up a choice made for reasons best known to the controlling faction on the new prison board. Certain it is that the structural plan adopted for the new prison by the removed commissioners, against the vigorous protests of the minority at the time, embodied all the old faults of American prison building and disregarded the recommendations made by Samuel J. Barrows as a result of his tour of European prison structures.

The settling back into a partially rehabilitated Sing Sing, as an economical solution of New York prison needs, however, is not likely to receive the same measure of acceptance. Sing Sing is not and cannot be made a fit place for reformatory work, and the time has come when all prisons should be reformatory. K.

PROBATION AND THE "PLEDGE"

There was doubt as to the efficacy of the "pledge" method of reforming drunkards in the minds of those who attended the Fourth New York State Conference of Probation Officers, held under the auspices of the State Probation Commission at Watertown, October 17-18. The discussion of this matter borrowed interest from the general endorsement given the "pledge" system by the delegates to the Thirteenth International Congress against Alcoholism at the Hague last summer. The doubt of the New York probation officers amounted, in the words of one of them, to "a general belief that the use of a 'pledge' is seldom effective". William J. Dempsey, county probation officer of Oswego county, told of the reply of one prisoner at the bar: "Now, Judge, never mind a new pledge, I've got a whole bureau drawer full of those pledges down home, and I'll just go down and take one of the old ones."

Opinion was divided among the speakers as to the wisdom of the "tapering-off" process. Young men should usually be required to stop drinking at once, was the opinion expressed by Thomas A. Fletcher, chief probation officer in the Utica City Court; but, he added, for older persons and especially for whiskey drinkers abrupt discontinuance may work physical injury. The importance of medical treatment in conjunction with probation was urged.

The use of probation as a means of requiring offenders to make restitution for stolen property and to support their families is growing, according to Vice-president Frank E. Wade, of the State Probation Commission,

who presided. There was almost unanimity, among the sixty people who gathered in round table discussion, that girls should be placed only under women officers, and boys of fourteen years or more only under men. Aside from the question of instruction in personal hygiene, it was pointed out that in dealing with boys it often becomes the task of the probation officer to wean them away from a "gang", or by securing the "gang's" confidence to elevate its own moral tone. One officer told of doing this through the agency of a boys' club.

The view came refreshingly to the front that a probation officer should be somewhat of a vocational director. He should feel a responsibility, it was thought, as to the nature of occupations in which juvenile probationers of working age are employed. Children should be dissuaded from entering occupations which offer no prospects of advancement, or are harmful either to health or morals. This responsibility should extend also, it was argued, to wholesome evening recreation.

Citing the fact that during September over \$4,000 was collected from husbands convicted for non-support in the Brooklyn Domestic Relations Court, Alexander J. McKinney, chief probation officer in the Second Division Board of City Magistrates of New York city, urged the large benefits resulting from the use of probation in cases not only of non-support but wherever the offense has caused the complainant financial loss. Yet even men guilty of neglecting their families should usually be allowed, was the declaration of one speaker, to pay for their support directly to them rather than through the officer.

JAIL OR FARM FOR DRUNKARD?

Under this title Dr. S. D. Miller, in the Jacksonville, Fla., *Metropolis* advocates outdoor life in treating intemperance. He shows that last year in the small city of Jacksonville, with only ninety-five policemen, the total cost of the mere arrest of drunken men was \$33,000. Eight arrests were made daily, on an average, though these arrests were "repeaters" in many cases. Says Dr. Miller:

"All this is labor and money spent without producing any lasting results. The arresting and bailing of these drunkards does not stop the drunkenness nor expense, but on the contrary both the drunkenness and expense keep growing every year. The question is: What shall be done with this large and ever-increasing body of men who are a menace to the public at large and an enormous expense if arrested and kept confined? They can not be taken out into the pine woods and shot, as we would do with a lot of worn-out horses to save the city the expense of keeping them. . . . Chronic drunkenness is not a thing that can be stopped at will. Occasionally there is a patient who can stop drinking at will, but most of these unfortunates have an overwhelming craving for liquor seize them, which overcomes all their power of resistance. They are as helpless as a row-boat be-

fore a gale. When this mad craving sets in they drink because they must do so to relieve its overwhelming power. They can not resist it. It is mightier than they. It simply overpowers them. . . . They cannot be cured by prison bars. They need medical care. They should be treated at least as humanely as we would treat a sick mule. We would not punish a mule for having a disease. We would not think of placing a man in jail for having typhoid fever, epilepsy, or malaria, but we do place the chronic alcoholic in prison, the same as the heathen in dark ages placed a man in prison for having epilepsy. If these same 500 chronic drunkards were properly treated they would become useful citizens and supporters of their own families, instead of a great public expense.

"The method of caring for them is simple. Let the city or county buy a farm, place an honest, conscientious physician in charge, with a competent farmer to direct the farm. . . . The farm would soon produce enough to pay the living expenses of all the patients, with the possibility of making money out of the farm. Here the patients would be treated until they had lost all desire for whiskey, and would then go out into the world as useful citizens."

The New Britain, Conn., *Herald* likewise advocates outdoor employment for the intemperate:

"Establish a farm colony to which drunkards could be sent for long terms, say five years, with parole possible at the end of one year, and not sooner. Let this institution be arranged upon the cottage system, with say not more than twenty in one building—all under the control of a central organization bringing about as nearly as possible the atmosphere of a decent home and family; the less air of an institution the better. If any rounder shows signs of ability to learn a trade let him be encouraged. This farm colony should be under the control of the state and there should be land enough for each inmate to get outdoor labor under kind supervision."

JOTTINGS

PUTS PRISONERS ON FARM

"At the Central prison, Toronto, we are experimenting with a farm of 840 acres. I have taken there between 800 and 900 men and I have failed with only three out of 100. Probation and suspended sentence have failed with them, but we are going to give them one more chance to make good without bolts and bars. There isn't a bolt or a bar or a gun on the farm," says Warden Gilmour.

DETROIT HOUSE OF CORRECTION

Z. R. Brockway was the first man to develop the financial side of this large institution. The seeds he sowed nearly half a century ago are bearing good fruit still. Said W. H. Venn at the Omaha congress: "July 6, 1911, the Detroit House of Correc-

tion passed its fiftieth mile-stone. During the last thirty-two years over \$1,000,000 in profits were turned over to the city of Detroit, to the families of prisoners, and to the prisoners themselves. Since 1880 the city of Detroit has annually received sums ranging from \$9016.83 to \$52,711.64. The original expenditure by the city of \$189,841.36 has been turned back into the treasury of the municipality, the institution has paid its own way, and in the fifty years showed a fine balance of \$1,254,178.15. In addition to this showing, the prisoners since July, 1901, have been receiving financial benefits ranging from \$5,958.14 to \$9,670.38 annually.

"In addition to amounts paid the prisoners, some of which are sent by the men to their families, provision is also made for the families of those who are imprisoned on the charge of abandonment. This is accomplished under a statute which provides that \$1.50 per week for the wife and an additional 50 cents for each child under fifteen years of age be paid them out of the funds of the institution."

PRISON CAMPS IN NEW ZEALAND

As described by J. A. Kayll at the Omaha Prison Congress, "the sites chosen for the camps are at a considerable distance from close population and in districts noted for their invigorating climate. The prisoners are out all day working at hard manual labor either on the hills or the plains. They develop keen appetites and sleep well. The result is a rapid improvement in physique, a much more contented mind, and the formed habit for sustained industry. The state also benefits considerably, for every year several hundred thousands of trees are planted on an otherwise barren soil. The work does not compete with free labor, inasmuch as the government could never get a sufficient number of men to take up the work under such conditions as are necessary to make it a possible undertaking."

CONVICT LABOR IN INDIANA

When the Indiana legislature abolished contract labor in the state reformatory there was rejoicing. But when time passed and work continued to be done under what was in reality but a thinly veiled contract with the Reliance Manufacturing Company, joy was not unmixed. Now the legislature has forbidden this work, and the reformatory labor is thus in fact what it before pretended to be.

When the members of the International Prison Congress went through this reformatory last fall and saw the four hundred men working at fever speed on this very contract, one of the European experts remarked: "We can show nothing like such product in Europe, but it is not reformatory."

LONDON MURDERS

"In the last year in London, with a population of 7,000,000, there were but nineteen

murders. Of the nineteen murderers five committed suicide. All of the others except four cases were arrested and either convicted and executed or committed to the insane asylum."

PROBATION AND PAROLE

The papers are making favorable comments on the plea of Attorney-General Wickersham for paroling life prisoners.¹ There are certain public speakers who decry parole and refuse to see the good in it.

The new Texas parole law has gone into effect. It provides that paroled prisoners must have employment and for the settlement of differences between them and their employers.

A. W. Towne, secretary of the state probation commission, takes this tone toward probation:

"During the past ten years the probation system has been steadily growing in New York state until to-day it is used, through paid or volunteer officers, in more than half of the counties and more than three-quarters of the cities. Over 11,000 children and adults were under the care of probation officers last year, and over 1,000 of these had been convicted of felonies. The extension and strengthening of the probation system tends to decrease the number of persons committed to institutions."

LIFE PRISONERS IN ALABAMA

Thirty-one life prisoners in Alabama recently held what they called a "Life-time Man Convention," in which they adopted a petition for clemency which was printed in the *Montgomery Advertiser*, signed by seven names. Though they say they are "sadly sorry" for their crimes, yet they give no proof that they deserve clemency, nor can they under a system that has no grades and marks.

"RULE OF HONOR" PRINCIPLE

Says the Grand Rapids, Mich., *Press*, speaking of the state prison at Jackson:

"Seven shops now are operated on the 'rule of honor' principle, and the result is that guards are not needed for these particular divisions of the penitentiary. Owing largely to the new spirit of the men the warden has been enabled to make improvements for little or nothing which formerly would have been left until a state appropriation was made. For instance, when there was no money on hand to get new boilers for the laundry, a convict who knew how volunteered to draw patterns for the castings needed. They were cast in the institution and several hundred dollars' worth of repairing thus was done at a cost of about \$25. At the suggestion of another prisoner the timber in some old dry-goods boxes was used when a new partition in the tailor shop for which there seemed to be no available timber was necessary."

¹See THE SURVEY for October 21, 1911.

ROAD-MAKING IN NEW YORK

The *Syracuse Standard*, after describing the mile of highway built by men from the penitentiary, says:

"The men themselves appear to be benefited by the work. They prefer the life to confinement at the penitentiary and for the most part are willing workers. So far there has been no trouble from attempts to escape, and but few of the men have so far violated the regulations as to require severe discipline."

CRIME AND THE PAPERS

The *Salt Lake City Telegraph* thinks that "the press of the United States is responsible for a good deal of increase in crime. The most respectable newspapers love to depict and magnify every form of criminality. If a woman is involved, and one generally is, her picture is displayed, the prisoner's picture, the jury's picture, the judge—the whole business; and what ought to be condensed into a couple of sticks is spread over columns every day, whereas if a very superb speech is made in congress or anywhere else, unless the speaker has obtained national fame, the speech is either dismissed with three lines or some reporter that never has written and never can write a speech gives what he calls the substance of it. The whole bearing of the business is that one horse-thief, or murderer, if he commits a real crime and is charged with it, is of more consequence to the public than all the statesmen in the land."

COST OF CRIMINALS

The Dallas, Tex., *News* has been printing a series of articles on prisons from which we quote this nutshell reason for expending large sums of money in training and caring for criminals:

"Men say, 'Why provide capital for caring for criminals?' The answer is, 'Because they are criminals.'

"We send men to prison for two reasons. The first is because they are dangerous. We want them where they cannot harm us. If that were our only purpose, possibly it would serve as well to keep them in the county jail or to lease them as it would to keep them in a penitentiary and work them upon state account.

"But our second object in sending men to state prison is that they may be reformed, rendered fit and safe again to become a part of society. It is because we believe that men may be cured of their evil ways that we limit the terms of imprisonment for most men convicted of crime, and provide for pardons and paroles. Just so long as we keep our laws fitted to that theory, it is necessary that the prison system shall be conducted so as to reform criminals. Otherwise, all convicted criminals ought to be sentenced to death or to imprisonment for life, for it is unsafe to liberate them if they have not been cured of crime."

SOCIAL AGENCIES

MADISON CONFERENCE ON SOCIAL CENTERS

GEORGE B. FORD

From October 25 to October 28 there was held in Madison, Wis., the first social center conference in America. It was organized by a society called the Social Center Association of America, with headquarters in New York city, and by the Extension Division of the University of Wisconsin. In response to their invitations there appeared at Madison nearly 200 delegates representing all interests, races, creeds, and localities. The eleven sessions of the conference were addressed by a remarkable set of speakers, including the governors of three states, the mayors of six cities, some of the most prominent educators in the country, sociologists, economists, newspaper editors, and people prominent in civic and social work. The whole conference was wonderfully inspiring. Everyone went away feeling that he had been present at the inception of one of the most remarkable and telling movements that America has yet embarked upon. A spirit akin to the fervor of a great religious revival actuated the whole conference. It seemed to those present that America was at last about to develop a true democracy; that at last the people of the United States were about to direct their own affairs, and further, that this Social Center movement was going to be the medium through which all the people in a given community could learn to know each other and so to help each other, and that this was to be accomplished by neighborhood gatherings in some public place like the school-house.

The conference was not only an inspiration; it was an education to all. That is to say, a great many people who had been interested in the starting of social centers in their own communities had been at a loss as to the best way to get results. Each person had been working out the whole problem for himself. This conference brought together the experiences, successful and otherwise, of people who had tried to solve the social center problem either in the large city or in the rural district,

and by the interchange of ideas and through general discussion a great fund of useful knowledge was accumulated.

No two people agreed as to just what a social center really is. Some were particularly interested in the civic side, that is, in what was termed the gathering in public places for open discussion of public questions. Some were interested particularly in the social side, in the

idea of bringing the families of a given community into closer friendliness with one another so as to create that spirit of co-operation which can be gained only by a mutual understanding. Some were interested particularly in the educational side, seeing in the social center a medium for the education of parents, who are usually so neglected in our modern educational system. There were some who saw the problem as a whole and who realized that a social center would be most effective if it combined all these different phases so that each would help toward the success of the others.

The conference was particularly fortunate on the opening night in having with it Governor Woodrow Wilson, because he, more than anyone else present, clarified the conception of the real meaning of a social center. Protesting that he was new to the subject, he yet reasoned on the platform in such harmony with his audience, and so logically worked out his subject, that he left the auditors with a very definite impression as to the different possibilities lying within the development of the social center idea.

In order to understand the real significance and value of the conference it might be desirable to go quickly over the history of the movement. Frances G. Vandergrift, of Pittsburgh, a woman who had long been interested in social welfare work, decided that she would like to do something worth while and distinctive along these lines, and she asked Mrs. David Kirk, of Pittsburgh, to help her. Mrs. Kirk came to New York and there became

interested in the possibilities of putting the moving-picture business on a better footing morally and educationally. A small committee of interested people was formed, and as they considered the subject they saw that it would be necessary to deal with other forms of commercialized recreation in working out their program. This soon broadened to include the neighborhood club, then the civic forum, and then the idea of the wider use of the school plant. In order to carry out their work they found it necessary to form two organizations—one, the People's Recreation Company, which would carry on experimental work with actual problems of organizing and directing commercial amusements of the better sort, and the other the Social Center Association of America, which would propagandize the social center idea and send out missionaries wherever it seemed desirable to start social centers. As their work developed they discovered that the subject of social centers was a very live one throughout the United States. With the splendid example of Rochester, N. Y., where the public use of the schools has become a prominent feature of the life of the people, and with the examples of social centers as worked out in many places in the West, particularly in Texas and Oklahoma, it seemed that the propagandizing function of the society demanded a much more representative body to carry it out. Further, they found that sending out missionaries to start social centers was quite impracticable, for such groups turned out to be successful only when they were a matter of spontaneous growth. The Social Center Association of America realized that it could be of the greatest service to the cause by calling a national convention which should represent all those interested in the subject. This resulted, through the co-operation and the indomitable zeal of Mr. E. J. Ward and of the University of Wisconsin, in the great convention at Madison.

This gathering formed itself into a permanent national organization with a definite purpose and with a constitution and by-laws and an effective group of officers. The purpose of the Social Center Association of America was defined as follows:

To promote the development of an intelligent public spirit through the use of public school houses and other public places for the free discussion of all public questions and for all wholesome civic, educational, and recreational activities.

The first plank of the platform reads:

The social center represents all the people in all those interests which are common to all. It is the people's forum and permanent headquarters for citizenship and neighborly spirit. In it the people come to know one another and how to make their government work. The public school plant now functions only in part. Its present service is parental. The social center makes it also function fraternally. Details of this wider use of the school plant vary with local needs, but its spirit is the Lincoln spirit.

The officers elected are:

President, Dr. Josiah Strong, New York city.

Vice-president, Frank P. Walsh, Kansas City.

Second vice-president, and chairman of the Program Committee, Dr. George M. Forbes, Rochester, N. Y.

Third vice-president and chairman of the Legislative Committee, Louis Brandeis, Boston.

Fourth vice-president and chairman of the Local Arrangement Committee, Charles Frank, University of Kansas, Lawrence, Kan.

Secretary, Edward J. Ward, Madison, Wis.
Treasurer, George W. Harris, Cincinnati.

It was arranged to hold the next conference one year hence at the University of Kansas, and in the meantime, as far as possible, the secretary, E. J. Ward of the University of Wisconsin, is to keep the delegates in touch with one another and informed as to the progress of the movement. It was hoped that a magazine would soon be started to serve as a medium of inter-communication among those interested, a sort of clearing-house of social center ideas and especially as the great propagandist organ for the movement.

At the various sessions the subject was discussed from different points of view. At one session, given up to the farm problem, Dean Russell of the Wisconsin Agricultural College insisted that the best energies of the city come from the country and that the country, feeding its most vigorous youth to the city, will soon offer only the less energetic type for the city to draw upon. "It is all nonsense," said another speaker, "to cry 'Back to the farm!' As the farm now is, it means atrophy of the best human faculties."

The new awakening in the country was said to come from the consolidated schools and was proved to exist by such notable movements as those in Kansas, Texas, Wisconsin, and other states for rural neighborhood clubs and neighborhood improvement centers in the schools. Another session was given up to the educational side, and prominent educators showed the relation

between the school and the social center. Another session was devoted to the discussion of the possibilities of a career as a social center worker. About 150 students of the University of Wisconsin were present at this session by special invitation. Here George R. Forbes, of Rochester, N. Y., who, as chairman of the Board of Education, had a leading role in the Rochester social center movement, showed most clearly the possibilities and the attractiveness of social center work. Another session was given up to the commercialized amusements, the motion-picture show, the dance hall, etc., showing the possibilities of the use of the model motion-picture show or the model dance hall in the social center as a means of abating the current exploitation of these amusements.

Much was made of the opposition which a live social center is likely to meet from the political machine. The case of Rochester, N. Y., was discussed in full, for here the machine soon realized that an open discussion of public questions was not to their advantage—with the result that the appropriation for the wider use of the schools was cut off, the superintendent was deposed, and the social centers were temporarily without a chance to meet. But the civic groups in Rochester were so thoroughly organized before this happened that there is not the slightest doubt that they will survive, stronger than ever despite these obstacles, and that it is only a matter of time before they will come back greater than before.

Throughout the conference a spade was called a spade, and the power of the social center as a medium for righting the political wrongs of the country was brought most markedly to the fore. It was realized that the social

center movement can be successful only so long as it is absolutely non-partisan. Most of the western men present laid practically the whole emphasis of the social center movement on the idea of the open forum for the free discussion of public questions; but all realized that the social center gained in the end by being much more comprehensive in its scope; by developing along recreational, educational, and social lines as well as along the line of the civic forum. In other words, the social center should bring all classes, all ages, all races, all sects, all interests together in one family group where they can know one another and sympathize with one another's point of view, where they can "swap" experiences, and broaden that life which the home too often checks and confines.

The movement is most auspiciously launched. The character and quality of those present at the convention, the value of the convention in an inspirational and educational way, the fact that there were present editors of a number of the leading progressive papers of the country, and that nearly all finished by agreeing on one line of attack—all of this means that the movement is destined to have a great success, a success which in its ultimate working out means the triumph of American life and American democracy.

The convention was concluded by four hundred people rising and with great fervor singing the following stanzas:

Come close and let us wake the joy

Our fathers used to know,

When to the little old schoolhouse

Together they would go.

Then neighbor's heart to neighbor warmed

In thought for common good;

We'll strike that fine old chord again—

A song of neighborhood.

"BUTTRESSING THE FOUNDATIONS OF DEMOCRACY"

ADDRESS AT THE NATIONAL CONFERENCE ON CIVIC AND SOCIAL CENTER DEVELOPMENT,
MADISON, WIS.¹

GEORGE M. FORBES

President Board of Education, Rochester, N. Y.

The movement for the wider use of school "buttress the foundations of democracy." It buildings in Rochester was from the very was, therefore, in the very broadest sense beginning consciously and deliberately educational, and yet without any suggestion planned, as Governor Hughes expressed it, of the organization or atmosphere of a

¹"After Mr. Forbes had spoken," writes a correspondent, "he was cross-questioned by Governor Woodrow Wilson and it was brought out that the direct cause of the strangulation of the social center movement in Rochester was the enmity of the political machines of both parties, especially the enmity of the dominant Republican faction. It was further brought out that as a

result of this same situation Mr. Forbes had himself been defeated for re-election to the presidency of the board, so that if the present drift goes unchecked the reactionary elements in Rochester may make a clean sweep, not only of the social centers, but of the progressive educators of that city."

school. It was educational in the sense that where there is human aspiration and joint effort for better things there is education. The very foundation of the movement was built upon the underlying assumption of democracy that the spirit of good-will is in the average man, and that this spirit may become dominant; that this spirit is ethical and has two aspects. One is the consciousness of the essential equality of men as persons. Upon this is founded the sense of justice. The other is the consciousness of the essential solidarity of men, so that they must realize the true good together. Upon this is founded the spirit of brotherhood. Now democracy assumes that the average man will take this ethical attitude when rightly appealed to and when he is free to act; i. e., it assumes that you can trust the final issues of human well-being to the sense of justice and the sense of brotherhood of the average man. This means that the average man is ethical in the very roots of his being, and capable of such ethical development as makes him worthy to be a member of the final court of appeal for justice and brotherhood. What is over-looked in this assumption is the established fact that absolutely no inborn endowment of a human being develops except in response to its appropriate stimulus, and that the selfish instinct, equally innate, may be so stimulated as to repress the ethical nature and leave it to atrophy and perish altogether. It is, therefore, an absolutely essential condition of democracy that the ethical spirit shall be aroused in the average citizen by appropriate stimulation. This can not be left to hap-hazard influences. The existing dominant influences are those which appeal to selfish instincts. Modern individualism with its "each for himself" has abnormally stimulated the spirit of unscrupulous competition on the one hand and monopolistic greed on the other. It has repressed and atrophied the sense of brotherhood and developed to an inordinate extent the selfish impulses. Under these circumstances the faith in democracy is futile unless there is a systematic appeal to the ethical spirit, the deliberate provision of a soil in which it can grow.

We are accustomed to say that social evolution has reached the conscious stage, that we are advancing with increasing momentum because we are intelligently shaping social progress and not leaving it to the slow

processes of nature; but what institutions are we shaping? Are they those which will guarantee the systematic development of the communal spirit? Rather we are now intensely occupied in forging the tools of democracy, the direct primary, the initiative, the referendum, the recall, the short ballot, commission government. But in our enthusiasm we do not seem to be aware that these tools will be worthless unless they are used by those who are aflame with the sense of brotherhood. If the action of a democracy is to be but the resultant of a clash of selfish interests, it is hardly worth battling for. It can give at best but a negative good. The truth is that we have developed every kind of institution and every form of education except the one fundamental kind of institution and form of education upon which the very existence of democracy depends. Every institution within the state, except the public school, is more or less exclusive. The family, the church, the political party, the social classes, the endless social groups and organizations, commercial, industrial, fraternal, purely social—all are exclusive and have exclusive interests. They can never develop the ethical spirit as a community spirit, a spirit that transcends all such bounds and feels that its supreme membership is in the whole community and that the greatest good is that which may be shared by every human being in the community.

The public elementary school, our only non-exclusive institution, can not adequately meet the ethical demands of democracy. Its limitations are too great. One serious limitation is the fact that it is confined to very immature minds, with very narrow and very simple experience. Another is that all school work is by necessity artificial, isolated from life, even from the life of the family, and so abstract. The school, as such, is not an ethical community. It is not a democracy. It is an absolute monarchy. It is an institution framed to furnish every child with some mastery of the fundamental tools of civilized life: reading, writing, and the elements of number and measure. Hence, no matter how excellent the ethical teaching of the elementary school, it is utterly inadequate to develop the ethical attitude of the mature citizen to the problem of the whole community. It is utterly unable to fortify the child against the selfish appeals of real

life. Democracy must have its distinctive institutions for the stimulation and development of the community spirit. These institutions must be free from the limitations of the public schools; i. e., they must appeal to relatively mature minds dealing with the actual experiences of community life. Furthermore, they must be in themselves a realization of democracy, not merely non-exclusive, but positively all-inclusive, the one institution within the state that takes in everybody solely by virtue of his living in the community; and, lastly, the relation of these institutions to the community life as a whole must not be artificial nor abstract, but vital, exercising real initiative, dealing with real problems with a view to real betterment of community life.

If Rochester has any lesson to teach regarding the community use of school buildings, it is because the movement in Rochester was from the very beginning consciously and deliberately founded upon these principles, and its supreme aim was to arouse and develop the ethical spirit of the whole community. The movement was, therefore, in the broadest and most fundamental sense educational, but it was in no sense the establishing of a school or the extension of existing schools. The most vital education, and preeminently the ethical education, essential for citizenship can never be achieved in the artificial atmosphere of a school. Hence the very deepest purpose of the movement was to make each neighborhood conscious of its civic functions and power; it was to make real democracy conscious and bring it into action. The idea was to establish in each community an institution having a direct and vital relation to the welfare of the neighborhood, ward, or district, and also to the city as a whole. What was called the civic club, composed of adult citizens of all classes, parties, and shades of opinion, was the very foundation stone of the whole movement. And the first great lesson of the movement is that such organizations became actualities, held their meetings in school buildings, have had continuous existence for four years; that they did actually develop the community spirit in a most remarkable degree; and that they proved to be capable of discussing in the spirit of fairness and good-will questions involving the most extreme and radical differences of opinion. They proved not only will-

ing but eager and insistent to hear both sides of the questions considered and they did not "lose their heads", nor were they "carried away" by radical utterances and appeals so as to take any hasty or ill-considered action. Not a single instance of such action can be cited in the history of some twenty civic clubs in as many different neighborhood school buildings. On the contrary, on their initiative notable contributions to the welfare of the neighborhoods and to the whole city have been made. It was this spirit which profoundly impressed Governor Hughes and led him to say on the occasion of the second anniversary of the first civic club: "I am more interested in what you are doing here than in anything else in the world. You are buttressing the foundations of democracy."

There are a multitude of lesser witnesses who will testify that the atmosphere of these clubs and their associated activities gave them a wholly new revelation of community spirit, that here they felt for the first time the wonderful thrill of human brotherhood actually realized. The intensity of this feeling was illustrated by a prominent visitor from Buffalo, who remarked as he came out of a meeting: "I feel as if I had been in a religious revival."

As the movement developed certain very significant phases appeared. One of the most interesting was the influence of free and fair discussion upon radical opinion. One of the most radical socialists in the city publicly stated that his views had been seriously modified by the discussions in the civic clubs. Many others gave similar testimony. This result is the more surprising because it was feared by many that these free centers of public discussion would be seized upon and controlled by radicals and extremists, and because radical opinion was freely expressed. Opponents of the movement charged that they were so controlled, but no action of any civic club ever gave the slightest foundation for such a charge. On the contrary, the net result of the movement was to modify extreme opinion and bring it into line with rational progress. The movement vindicated the opinion that the average man is a conservative or moderate progressive, and will take only one step at a time in the path of progress. Another most interesting side-light was the fact that the most congested quarter of the city, with a large for-

eign element in the population, and—judged by conventional standards—lacking in education, culture, and material well-being, proved to be most thoroughly responsive to the civic spirit; and it was a common remark of the ablest speakers at civic clubs that they did not find in the twelfth ward, with its wealth and culture and large number of so-called "best citizens," anything like the civic spirit and breadth of view that was found in district No. 9, which is the most congested quarter of the city. Several of these clubs had such border line locations that they gave a practical demonstration of the fact that all classes of the citizenship could work together without a trace of class distinction. There was nothing in the experience of these clubs which so impressively brought home the lesson of real democracy as the appearance of public officials in response to the invitation to explain their policies, their acts, and the methods of operation of their departments. There was such full opportunity for questions and answers as resulted in illuminating for the average man the whole field of their work and made him a much more intelligent and sympathetic critic of public officials. It vitalized for both official and citizen the theory that the officials are really servants and not masters and exploiters of the people.

Equally effective in a different way was the method by which some clubs made use of a political campaign. They invited able representatives of the various parties to present to a non-partisan body in a calm and dispassionate way, on different occasions, their reasons for their political faith. Nothing could more effectively emancipate the average man from a blind and narrow partisanship born of tradition and prejudice.

I dwell thus upon the life and functions of the civic club because it is the corner-stone of all that is distinctive in the Rochester movement. It means that our public school buildings, consecrated to education, may become the instruments of that deepest and most fundamental education upon which the very existence of democracy depends. This use gives depth, seriousness, purpose, and unity to every subordinate use. All other clubs—the women's clubs, the young men's clubs, the girls' and the boys' clubs—are inspired and shaped by the spirit and ideals of the civic club, and for this reason they too become schools of the community spirit.

They are recreational and educational in many other respects as well, but the civic spirit gives unity and purpose to the whole. This gives all its real initiative and power to the movement, because it takes it up into the very life and purpose of democracy. I do not wish to be misunderstood. Without the civic club, the social center is well worth while. Its possibility of certain kinds of good to the community is inestimable. Apart from the civic club, every school building should be a neighborhood club house. No one could possibly estimate too highly the need in every neighborhood for a public place of wholesome recreation, social intercourse, physical development, and the opportunity to combat, by means of lectures by competent persons, the awful ignorance of proper conditions of wholesome living and social well-being. These ends are amply sufficient to justify this convention, and support an increasing and widening agitation till every school building in this country is suitably equipped and open for this purpose, without any other payment by those who wish to use it than the public taxes to which all self-supporting persons necessarily contribute directly or indirectly through the cost of living. I have seen a neighborhood of working people, characterized by vicious moral standards, chiefly because its young working men and women were driven to the streets and dance halls for recreation, undergoing complete transformation because the young men and women were permitted to use the school building under inspiring supervision, which thus provided the wholesome recreation and the powerful moral impulse they sorely needed. I only insist that while the social center may be an inestimable good, it makes no necessary contribution to the problem of democracy unless it is also a civic center, developing the consciousness of communal responsibility and power. The social center may be an inestimable good granted *to* the people or provided *for* them, but it may not mean anything done *by* the people. New York city does a great deal for the people in its recreation centers, but there is nothing done by the people. If New York city had real civic clubs in every school building, a new charter would not be prepared by a handful of men and then presented to the legislature without even saying "by your leave" to the people who are to live under it. What I wish to insist upon is

that the civic club as embodying the spirit of real democracy is in my judgment Rochester's great contribution to the problem of the use of school buildings by the people. If Rochester's social centers have had a unique enthusiasm and vitality, if they have attained a unique hold upon the community, as I believe they have, it is because they have been also genuine civic centers inspired fundamentally by the civic spirit. No social center can meet the present crisis in the history of democracy without an organization open to all the voters of the neighborhood, and feeling the ultimate responsibility of citizenship for the securing of the common welfare—an organization in which every narrower interest of sect or party or class is swallowed up in the consciousness that the interests of the whole community are supreme, and that the effort to realize them in the spirit of brotherhood is the supreme function and the supreme satisfaction of citizenship.

These experiences gave the movement an increasing hold upon the steadily growing number of people who came within its influence. The best possible test of this "hold" was its power to meet and resist opposition. This opposition was intelligently focussed upon the very nerve of the movement, the free discussion of the civic club. It developed early and took various forms. One form was the quiet effort of political forces to take possession of civic clubs in their very beginning by dominating the initial meeting. This was successful in but one or two instances. Another was the sensational exploitation in the newspapers of the one or two cases of hasty or ill-considered remarks of speakers, and the exaggeration and distortion of any unusual incident, however innocent or trivial, in a way to excite prejudice and give an unfavorable impression. Another was the charge that the social centers were centers of socialistic propaganda, because socialists were permitted to present their side of questions under consideration, and because speakers of known socialistic views dealt in a thorough-going way with various phases of social wrong or injustice and progressive measures for remedying them. All these were unavailing except as they aroused the prejudices of many who did not know the facts.

The last resort was to strike at the appro-

priation and attempt to influence the authorities to cut it out of the annual budget before the movement should gather irresistible headway. A crisis came regarding the third annual appropriation, and a determined effort was made to defeat it; but the movement was already so deeply rooted and the authorities were so flooded with petitions, committees, resolutions, and protests from those who had felt its power and saw its significance that they were obliged to yield and make provision for another year. Finally the flood of popular influence for the appropriation was avoided by merging the appropriation with those for other purposes, so that it was not known till too late that the appropriation for social centers had been cut down to about one-third of that of the previous year. Success in restoring the appropriation to its former amount must depend wholly upon the initiative and leadership of the federated civic clubs and the public sentiment they are able to bring to bear upon the present administration. Meantime the energy and persistence of the civic spirit which centers in this movement is the greatest hope for the future in our community. It is the one rallying-point for the democratic spirit which is bound sooner or later to triumph in its determination to restore power to the people. I do not know whether the particular form of organization which I have described as a civic club will prove to be permanent in our own or any other community; but I am profoundly convinced that unless this or something like this can be given the permanence of a settled institution, democracy as a permanent and effective form of government will be but the end of the rainbow of humanity's great hope and age-long effort, ever receding as we advance.

In any case the movement in Rochester has increased our faith in the common man; it has demonstrated that, if he seems selfish, it is because he lives under conditions which bring no incentive but the one to look out for himself. It has shown most strikingly that the ethical spirit within him springs to life and power in response to the quickening influence of the community challenge; and, finally, that he finds his greatest satisfaction in the expression of that spirit in action, and is along with his fellows our only hope of a trustworthy, final court of appeal for the realization of justice and progress in human society.

PERSONALS

The difficult task of reorganizing and readjusting the work of the Providence, R. I., Society for Organizing Charities is being shouldered by James B. Williams, recently general secretary of the Detroit Charity Organization Society.

JAMES B. WILLIAMS.

In Orange, N. J., Mr. Williams was for three years general secretary of the Bureau of Charities. There he was instrumental in developing a number of welfare agencies such as the Public Bath Association, the local and State Anti-Tuberculosis Association, the Fresh-Air Home for Mothers and Children, and similar enterprises. Under his leadership the Bureau of Charities became active in the promotion of social legislation which led to the establishment of the State Reformatory for Women, the appointment of a Commission for Codification of the Poor Laws, and the establishment of an up-to-date system for the treatment of advanced cases of tuberculosis.

Since 1908 Mr. Williams has been general secretary of the Detroit Charity Organization Society. His administration may be measured concretely by the budgetary growth of the organization from \$3,000 at the time of his appointment to \$20,000 at his leaving. His executive ability and his grasp of the broader community problems of this virile middle western city were effective in securing the appointment in Detroit of a Housing Commission, the establishment of a Children's Bureau, the organization of a Playground Association, and of the Confidential Registry Bureau. In connection with his own work he organized the Central Council of Charities and secured the gift of a Fresh-Air Home, now considered one of the best in the country, and also of a Charities Build-

ing which became the property and home of the Charity Organization Society.

Mr. Williams is a graduate of the University of Indiana, where he specialized in social science. Since his graduation in 1904 he has been continuously in social work. First as investigator for and later as assistant secretary of the Cincinnati Associated Charities, he went outside his regular work to aid in the establishment of the Lodging House for Homeless Men as a municipal agency.

ing which became the property and home of the Charity Organization Society.

In choosing a leader, the Providence society faced a situation rendered more difficult because of the able administration of its former secretary and of the long time during which it was without a head. Mr. Williams comes to his new task with unusually rich experience in social organization and a proved capacity for constructive work.

C. A.

Leroy Hodges, formerly commercial geographer for the Tariff Board, and before that special agent and geographer of the United States Immigration Commission, is filling the novel post of Commissioner of Immigration of the Southern Commercial Congress. Since his appointment in the spring Mr. Hodges has been co-operating with Senator Fletcher and Managing Director Dawe in organizing the work assigned to him. In a letter to the executive committee expressing sympathy with the view of the Southern Commercial Congress that the lands of the South had better remain empty than bring on a second race problem, Mr. Hodges says:

"There is a pressing demand now in the South for skilled industrial laborers as well for unskilled workmen who can be relied on, and who will not further complicate our Negro problem. I would advocate, however, that the energy of the Southern Commercial Congress be directed toward turning agriculturists toward the South. The large tracts of land which are now lying idle throughout the South should be placed in condition to produce not only subsistence for the army of workers who will be attracted to the region in quest of employment as our industrial development continues, but also to furnish the raw cotton, tobacco, sugar cane, and other commodities which our own mills and factories will require outside of the export demands. While this may be made the main work of the congress for the present, I do not mean to say that the demand for industrial laborers and skilled artisans should be overlooked, for I believe that as far as it is practical an effort should be exerted to supply this need. But as these latter classes are seldom permanent settlers in any one locality, the Southern Commercial Congress can best serve the South by guiding within her boundaries those who will become real factors in the communities in which they take up their residence."

Though a native of North Carolina, Mr. Hodges received his early education in Virginia. After studying law and economics in Washington and Lee University and at the University of Chicago, he spent two years in railroad and engineering work. In 1908 began his connection with the United States Immigration Commission.

The Ohio State Commission for the Blind, which, though first created in 1908, has just started to develop the employment phases of its work, has secured Charles F. F. Campbell

as executive agent. Mr. Campbell, who leaves the secretaryship of the Pittsburgh Association for the Blind, scarcely needs introduction to SURVEY readers. Son of Sir Francis Campbell, the blind founder of the Royal Normal College for the Blind in London, he has since graduating from the Massachusetts Institute of Technology been continuously engaged in furthering progressive movements in the field of his present service. The emphasis of his efforts has been laid largely upon the development of vocational work. From its inception he acted as executive agent of the Massachusetts Association for Promoting the Interests of the Blind, and under the auspices of that society directed an experiment station for trade training. When the permanent State Commission for the Blind was created in Massachusetts, largely as a result of the association's efforts, Mr. Campbell was made superintendent of the industrial department. Giving much time to investigating processes of work in numerous industries, he has been pioneer in seeking new spheres of livelihood for the blind side by side with the seeing. His experiments led to the development of the modern arts and crafts hand-woven rug as an industry for the blind. In 1909 Mr. Campbell became director of the work for adults which the Pittsburgh Association for the Blind conducts in Western Pennsylvania. During his administration the Pittsburgh Workshop for the Blind was established.

The fact that pensions are given in Ohio to the needy blind who have lost their sight in that state makes it possible for the Ohio commission to devote much attention to those who desire employment. The commission has no intention to establish any large workshop in the state, and while it will maintain headquarters at Columbus it expects to foster the employment of the blind either as individuals or in small groups, so that the employes will live, as far as possible, in their own homes.

Mr. Campbell is editor of the *Outlook for the Blind*, and secretary of the American Association of Workers for the Blind.

J. Byram Deacon has been appointed financial secretary of the Charity Organization Society of New York city. Mr. Deacon was at the Woodbrooke Settlement for Social and Religious Study in Birmingham, England, during 1907. The next year he attended the New York School of Philanthropy. From June 1908 to September 1909 he served as superintendent of the Charity Organization Society of Paterson, N. J. From Paterson Mr. Deacon went to Philadelphia to become executive secretary of the Pennsylvania Society for the Prevention of Tuberculosis. For the last two years also Mr. Deacon has been secretary of the New Jersey Conference of Charities and Correction.

Max Mitchell has resigned as manager for the Federated Jewish Charities of Boston to become head of the Cosmopolitan

Trust Company, a newly organized bank for the savings of Boston immigrants. Mr. Mitchell has been closely associated with Jewish social work since 1891, when he came to America from Roumania and started as an office boy with the Federated Jewish Charities. He has been connected with the federation ever since—for the past ten years as its manager.

Aside from his association with the Jewish Charities of Boston, Mr. Mitchell has been prominently identified with the general social work of the city. A leader in the creation of the State Employment Bureau, he was also chiefly responsible for the erection of the new Immigrant Station. When the agitation over the higher cost of living arose, Mr. Mitchell was elected chairman of a committee, with power to appoint the committee of nine which conducted the preliminary investigation. He was one of ten members who organized the Boston City Club.

Mr. Mitchell has been active in immigrant removal work in Massachusetts, Maine, and New Hampshire, and largely through his efforts 300 immigrant families have been placed on Massachusetts farms. He founded the National Association of Jewish Social Workers, served as its first president, and is now its treasurer. He is vice-chairman of the National Immigration Council, a member of the Executive Committee of the United Improvement Association, and an assistant secretary of the National Conference of Charities and Correction.

The recent appointment of James Minnick as secretary of the Illinois State Association for the Prevention of Tuberculosis and as superintendent of the Chicago Tuberculosis Institute is a gain for the city of Chicago in the same degree in which it is a loss to Providence, where for seven years he was general manager of the Society of Organizing Charities and was also later made secretary of the Providence League for Suppression of Tuberculosis. For the organizing of the latter association he was largely responsible. Mr. Minnick's record is one of continued hard work and success against odds such as pioneer efforts usually encounter. In Chicago, where he first began as a district charity worker in the stock-yard district, his enthusiasm and executive ability made him one of the best known agents of the Associated

MAX MITCHELL.

Charities. His return to that city has proved a source of gratification to many of his friends and co-workers. In Providence, where he took charge of the Society for Organizing Charities in 1905, he found an organization with an annual budget of \$1900, and through his efforts that budget reached its maximum in 1910 by an expenditure of over \$22,000. Aside from his work as manager of the Society of Organizing Charities, Mr. Minnick exercised his influence upon the community by taking the initiative in a large number of important movements, in the administration of which he was always ready to accept the burdens which his fellow-workers so willingly placed upon him. The Rhode Island Anti-Tuberculosis, the District Nurses', and the Play-ground Associations, and other similar welfare movements found in him a wise counsellor and a progressive leader during the period of their organization, and it was not until his health failed him because of overwork that it was realized what responsibilities had been placed upon him. In the field of legislation considerable improvement relating to conditions of labor and sanitation were attained through his ready co-operation and knowledge of existing conditions. James B. Williams, who is to follow Mr. Minnick, will find a wide field of activity opened by his predecessor, in which his leadership and counsel is impatiently awaited.

Dr. Charles P. Emerson, who for several years has served as superintendent of the

CHARLES P. EMERSON.

Clifton Springs, N. Y., Sanitarium, has been appointed professor of medicine and dean of the School of Medicine of Indiana University. Dr. Emerson, before he went to Clifton Springs, was for nine years on the medical of the Johns Hopkins Hospital in Baltimore, and toward the end of his term there was resident physician, having served previously as an associate in medicine. Dr. Emerson for some time has been one of the contributing editors of THE SURVEY.

The Circuit Court Judges of Cook County, Illinois, (Chicago), have elected Judge Merritt W. Pinckney to his third term as judge of the Juvenile Court. The importance of the work of the Juvenile Court is recognized by electing him at the same time

chief justice of the Circuit Court Judges. The re-election of Judge Pinckney to the Juvenile Court at this time is especially gratifying for the reason that upon him will devolve the responsibility of putting into operation in Cook county a most important amendment to the juvenile court law—an amendment for the securing of which Judge Pinckney and Chief Probation Officer John H. Witter were to a considerable degree responsible.

The amendment to the juvenile court law is as follows:

"If the parent or parents of such dependent or neglected child are poor and unable properly to care for such child, but are otherwise proper guardians, and it is for the welfare of such child to remain at home, the court may enter an order finding such facts and fixing the amount of money necessary to enable the parent or parents properly to care for such child, and thereupon it shall be the duty of the county board, through its county agent or otherwise, to pay such parent or parents at such times as said orders may designate the amount so specified for the care of such dependent or neglected child until the further order of the court."

Unless due care is exercised in the investigation of the cases that really deserve to come under the operation of the law, there will be many frauds and naturally the law will become a boomerang. This result would be unfortunate, because the law is in the direction of keeping worthy parents and their children together instead of separating them, a thing which all social workers believe to be right.

H. W. T.

Hospital service in Illinois has recently undergone a number of important changes in personnel. Dr. J. L. Greene has resigned the position of alienist on the State Board of Administration to accept the superintendency of the State Hospital for Nervous Diseases at Little Rock, Ark. His place on the board of administration has been filled by Dr. Frank P. Norbury, formerly superintendent of the Kankakee State Hospital. On October 10 Dr. Sidney D. Wilgus, after eighteen months' service at the Elgin State Hospital, took Dr. Norbury's place at Kankakee. Since that date Dr. Ralph T. Hinton, formerly assistant superintendent in Jacksonville State Hospital, has been appointed superintendent at Elgin State Hospital.

BOOKS FOR SOCIAL WORKERS

LILLIAN BRANDT

Contributing Editor

JUSTICE. A Tragedy in Four Acts. By John Galsworthy. Charles Scribner's Sons. New York, 1910. Pp. 109. Price 60 cents. By mail of THE SURVEY, 65 cents.

Mr. Galsworthy's Justice gives one hopes

for the English drama. To the social worker it is inspiring that these hopes seem to lie in the re-socialization of the drama. The strength of this playwright's arraignment of the English criminal code lies in its restraint. Throughout there is deliberate underdrawing of situations, no ranting emotionalism, and little harrowing detail. Easy openings for tragic but not unlikely complications are passed over. By suggesting many such potentialities in the general situation, instead of making any particular ones explicit, the power of the play is made ten-fold. Being a true artist, the author has selected essential elements which form a type of experience—not a mere experiment in realism. Fine restraint is also noticeable in the choice of characters. Corruption of law, with which a crude writer might have filled the plot, is absent. Every character is an excellent representative of his profession as it is at present conceived. Serious personal shortcomings are eliminated except in the hero. The problem is thus stripped to its social essentials. The result is a less disagreeable and more truly tragic drama. The issue is clear-cut between the individual and the institutions and traditions of society. The protagonists themselves, moreover, are not sentimental martyrs; they are weak and distinctly human. To the reformer the play is a strong plea for individualization of penalties. Falder is a neurotic, sensitive man, who needed probation, or an indeterminate sentence in a strict reformatory, and complete removal from an environment which offered severe temptations and later stigmatized him. The lone woman complicates the problem with the terrible inflexibility of the divorce law.

T.D.E.

CRIME AND CRIMINALS. 1876-1910. By R. F. Quinton, M.D. Longmans, Green, and Company. New York, 1910. Pp. 259. Price \$1.50; by mail of THE SURVEY, \$1.60.

The recent writings of Russell, Martyn, and Galsworthy present the English treatment of crime from the points of view of a social worker, an ex-convict, and a reformer-dramatist, respectively. Dr. Quinton's is the judgment of a progressive and experienced prison official. He defends the system, not unqualifiedly nor exhaustively, by a statement of results in lowered prison population, by a comparison with early conditions, and by counter-attacks on the stern old-line theorists as well as on the sentimentalists. The present régime is a compromise not in theories but in practice. It is well suited to the handling of the professional criminals and recidivists who form the bulk of the prisoners. Exceptional cases must suffer. The evils come not from the administration of the existing system but from its incompleteness. Preventive detention and industrial-reformatory treatment for habituals, defectives, and reclaimables are soon to improve matters, if judges have learned their value.

Dr. Quinton discounts the stories of ex-convicts, who are apt to be more sensational than

is Mr. Martyn, in describing diet, discipline, and sanitation. The author misjudges Galsworthy's play, for he sees in it only criticism of prison methods. On the contrary Galsworthy contends, as does Dr. Quinton himself, that the system, taken at its best, does not provide properly for certain classes of offenders who need individual care.

The book is interesting and occasionally humorous, but it is without index or chapter titles. The outlines do not correspond to the page-titles, and there is no means of ready reference. The previous history of prison reform is thrust into the middle of the book, which opens with 1876.

While Dr. Quinton strongly favors the indeterminate sentence, and the treatment of the criminal rather than the punishment of his specific offense, he is not a Lombrosan nor a "theorist" of any kind. His is the conservatism of real experience.

THOMAS D. ELIOT.

THE GREAT ILLUSION. By Norman Angell. G. P. Putnam's Sons. New York, 1911. Pp. 388. Price \$1.00. By mail of THE SURVEY \$1.10.

An idea of the interest excited by this study of the relation of military power to the economic and social advantage of nations may be gained from the fact that it was published simultaneously in ten European countries and in Japan. The book, which is written under a pseudonym by a journalist of cosmopolitan experience, has been called one of the greatest contributions to the peace propaganda. Its strength lies in the fact that it aims to take this movement out of the realm of the spiritually ideal into that of the practical—to found an anti-militarism based on material advantage. Mr. Angell first takes up the "economics of the case" and shows that the idea that war is necessary is based upon the "great illusion"—a survival of past conditions—that the prosperity of nations depends on their political power, that conquest of a nation means confiscation of its material resources, and that military protection of the national trade and commerce is therefore necessary. He shows by abundant illustration from recent history that wealth does not change hands with conquest but remains with the population producing it and that, furthermore, on account of the "delicate interdependence of international finance" an attempt actually to seize or destroy the wealth of another nation would mean financial ruin to the conqueror and would always mean some financial loss. As for the protection of commerce, it is the foreign merchant and not the foreign Dreadnought that is to be feared by a commercial nation. As a matter of fact it is the trade of the peaceful nations like Switzerland and Belgium, known to be stable because not engaged in warlike preparations, that is the greatest rival of the old established commercial nations, such as England.

Mr. Angell's analysis of the "human nature of the case" is no less interesting. He shows

that all the evidence of history is against the popular conception of the unchangeableness of human nature and that the warlike spirit hitherto dominant in civilized as well as uncivilized human nature can be changed by considerations such as those urged in the earlier part of the book. He shows further that in modern times the warlike nations do not inherit the earth, and that physical force is a constantly diminishing factor in human affairs and pugnacity between nations is being replaced by such co-operation as is exemplified by international industry and finance.

The last fifty pages of the *Great Illusion* are devoted to suggestions for an anti-militarist campaign based not on idealism but on considerations of the practical common-sense advantage to the civilized nations of the world. Mr. Angell does not touch the subject of the use of arms against nations with a lower civilization or for suppression of internal disturbances, such as labor wars, but confines himself to warfare between two nations of the same economic development.

The *Great Illusion* is an expansion of a pamphlet by the same author which was published about a year ago and which excited so profound an interest in diplomatic circles as to lead to a demand for this more detailed study of the subject.

M. B. S.

A HOLIDAY IN GAOL. By Frederick Martyn. The Macmillan Company, New York. Pp. 278. 1911. Price, \$1.25. By mail of THE SURVEY, \$1.33.

These experiences of a cultured man, in custody sixteen months for business carelessness, complete the picture of English justice given in Galsworthy's play and in Mr. Russell's book. The journalistic style and sparkling humor smack of America. The even-mindedness of the author's criticisms, with neither sentimentality nor bitterness, is commendable, and remarkable under the circumstances. The natural temptation to generalize is resisted. The simple yet thorough descriptions are therefore so vivid that, if any part be fiction, it must be ranked with De Foe's best. The author's frank willingness to lie and bribe if he had known it would help him is unpleasant, and the absence of any friends for bondsmen or witnesses is conspicuous. The life was probably not so pleasant as it seems to him in retrospect.

The most flagrant abuses mentioned are as follows: The spite of detectives, due perhaps to low pay and the tipping system; arrests on false charges to obtain evidence for other charges of which the prisoner is not informed; treatment of unconvicted men like convicts; efforts to secure conviction rather than the truth; inequity of sentences; pettiness yet laxity of prison discipline; worse treatment in poorhouses than in prisons; little segregation of tuberculous convicts; special cells hired by rich convicts, who are served by less lucky ones; an absurd appeal to the home secretary as the only resort for petty injustices; failure to reform or even punish hardened offenders in the prison. Due

credit is given to good officials, and for many excellent practises which mitigate the system, but which are at variance with its fundamental theories. The reader is left to draw his own conclusions: that there are, first, these mediæval theories of law and punishment; second, many laws and rules, both good and bad, but inconsistent with these theories; and, third, practises either corrupt or lax, but in violation of the theories or the regulations, or both, which by mere chance are or are not to the advantage of the prisoner and society.

THE SOCIAL COMPOSITION OF THE TEACHING POPULATION. By Lotus Delta Coffman, Ph. D. Teachers' College, Columbia University. New York. 1911. Pp. 87. Price \$1.00. By mail of THE SURVEY, \$1.10.

What kind of person is forming the minds of our boys and girls? This is the question which Dr. Coffman has sought to answer through the use of the statistical method. His information was furnished by 5,215 teachers selected by a sampling process from the rural, town, and city schools of seventeen states. Three-fourths of the returns are from women, which is about the proportion of that sex in the teaching profession.

The typical American male public-school teacher, according to the author's findings, is about twenty-nine years of age, having started to teach at twenty, after a preliminary training which extended three or four years beyond the elementary school. His present annual salary is \$489. Both of his parents spoke the English language and were living when he entered the profession. They received about \$700 income from their farm, upon which they supported themselves and four or five children.

Our typical pedagogue began to teach in a rural school at a salary of \$390. In order to get a town school he had to obtain an additional year of training. For a city position it was necessary to add two more years of preparation. During the first six years of his experience there was a regular increase in his salary, but after that period, age and experience were less influential than training in advancing his salary.

The typical American female teacher is twenty-four years of age and began her work when she was nineteen, after four years' training beyond that of the elementary schools. At present she receives \$485. Her parents are both native-born and, with their four or five children, were living upon about \$800 when she left home to teach. Under the necessity of earning her living, she went to work, and her choice of an occupation fell upon teaching because it was a highly respectable calling. She first spent two years in a rural school, and then obtained a position in a town, the promotion being due almost solely to her experience, as no additional training was required by the town officials. To secure a city job she was compelled to undergo more training, at least for another year, and she found that any additional years of schooling she could afford increased her salary correspondingly. Each of the five years she has taught has been

marked by a rise in salary, and this condition would probably last two years more should she have to teach that length of time.

"Into the hands of teachers," concludes Dr. Coffman, "who more or less nearly conform to the above description is given the duty of transmitting the culture of the race to the youth of the land, of training them in the habits of thinking, in modes of behavior, in methods of work, and in intelligent appreciation."

Humble circumstances are not undisputable evidences of the lack of culture and efficiency; and yet it is probable that the ordinary student of society would be deeply disturbed to learn that the difficult task of preparing the coming generation for the activities of life is in the hands of people who have demonstrated no greater proficiency in worldly affairs than the persons above depicted.

Fortunately the average city-dweller will not be able to recognize the instructor of his boys and girls in this portrait. The reason for this has been pointed out by the author himself in the inadequacy of the range of his investigation. Few of the returns were obtained from the larger cities; the Pacific coast is not represented at all, and only three counties in New England.

After making allowance for this shortcoming, it must be acknowledged that the book is an important study. Not only because it will bring to the attention of the inhabitants of the rural and smaller urban communities their short-sightedness in not making the calling of the teacher attractive to a more ambitious class, but because it is the kind of study that is helping to make educating a real profession. Dr. Coffman has chosen a tool that, skilfully used, does respect-demanding work; and he handles it well.

THE SOCIAL DIRECTION OF HUMAN EVOLUTION.

An Outline of the Science of Eugenics. By William E. Kellicott. D. Appleton and Company. New York. 1911. Pp. 249. Price, \$1.50. By mail of THE SURVEY, \$1.62.

Mr. Kellicott sets forth the most recent principles of eugenics, as represented by the modern schools founded by Galton and the followers of the Mendelian principle of heredity. The essential theme of the book may be stated in the question: Is human heredity capable of control and has science advanced sufficiently to be used in directing and controlling, at least in part, human breeding? to which an affirmative answer is given.

The attitude that the social worker should take is stated by the writer as follows: "We should examine and re-examine current as well as proposed social practices and reforms from the racial point of view. . . . We should investigate not only the racial effects of the unfavorable conditions themselves, but also the racial effects of the measures directed towards the relief of such conditions."

Throughout the book, problems of eugenics, such as that involved in relieving parents of

their defective offspring, are stated clearly, but with little suggestion as to methods of meeting them. It is left to the social worker to revise his code wherever it may be vulnerable, and adjust his method to the needs of the race with the same care and foresighted sympathy as he does at present for the individual. The book should find a wide circle of readers among social workers, parents, and the public as a whole, as it is a concise, clear, elementary, and at the same time comprehensive discussion of the problems of heredity as related to the human race.—CAROL ARONOVICI.

JOTTINGS

A Novel Art Exhibition.—Desirous of bringing good works of art within easy reach of its neighborhood, the University Settlement of New York is holding an exhibition this week and next. The novel feature is that artists and connoisseurs connected with the National Arts Club have volunteered to act as interpreters of the pictures to those who come. The settlement has held three exhibitions in the past, in none of which, however, was the experiment of talks by artists tried. It is hoped that after this exhibition other settlements and neighborhood centers in the city will offer space, thus leading to a systematic effort to bring as many people as possible to an appreciation of recognized masterpieces.

Fire Demonstration.—How vital in the true sense—a matter of life and death—is the problem before the New York Factory Investigating Commission was illustrated again last week, when some 200 persons, the majority girls, were overtaken by fire above the fifth story of a New York factory loft building. A fire drill had been too newly installed to allay panic and the improved fire-escapes, lately installed, were cut off by flames from a fifth story window. The occupants got out without casualties; but their escape was more fortunate than satisfying as to the means for safety.

Would Abolish County Jails.—At the thirty-seventh annual convention of the Association of Directors of the Poor and Charities of Pennsylvania, Indiana, Penn., Francis J. Torrance, president of the Board of Public Charities, advocated the abolishment of county jails in rural communities and the substitution of district jails in their place. The association will meet in Erie, Penn., in October, 1912. H. Frank Eshleman, of Lancaster, Penn., was elected president and Louis C. Colborn, of Somerset, Penn., secretary and treasurer.

WOMAN'S PART IN GOVERNMENT

WHETHER SHE VOTES OR NOT

By WILLIAM H. ALLEN

DIRECTOR, BUREAU OF MUNICIPAL RESEARCH
AND TRAINING SCHOOL FOR PUBLIC SERVICE

Author of "Efficient Democracy," "Civics and Health," etc.

This is a new kind of book about government. It makes you want to work for better government between elections. It also tells you many ways to do it. It is a hand-book on straight-seeing, straight-thinking and straight-acting on public questions between election times. It is for editors, speakers, club workers, students, givers, voters and not-yet-voters. *men as well as women.*

"It aims not to settle but to raise questions, to encourage self analysis and study of local conditions, to stimulate interest in methods and next steps of getting done what we all agree should be done to make democracy efficient."

Price \$1.50 net. Postpaid \$1.62.

This is in a sense a first step toward making these annual exhibits serviceable throughout the year: possibly developing them into a permanent municipal museum.

THE COMMON WELFARE

NIGHT WORK AS DRIVERS SEE IT

"Here's the way it is," said one of the twelve hundred night drivers in the New York Street Cleaning Department who, with seven hundred other drivers and sweepers, went on strike November 8 in an unsuccessful protest against the night work which was instituted last April.

And as the public has had only fragmentary notions of what led up to this walk-out of civil service employes, which crippled the housekeeping of the greater city and put its health in jeopardy, it will serve an informing purpose to set down first of all what, to the minds of the men themselves, justified them in acting as they did. The night driver went on:

You go down to the stable for roll-call at ten o'clock at night. Your horse and cart are hitched up for you, and you go out on your route. Quitting time is supposed to be four o'clock in the morning, but you got to clean up everything in your district before you quit. See? Well, maybe everything goes along all right for a while. You got to make two trips; first for ashes and then for garbage. The rules of the department is that you can't mix 'em. The people ain't supposed to mix 'em in the cans either, but sometimes they do. In the daytime it's easy enough to tell what's in a can, but at night it's different. You can't tell by lifting it, 'cause some kinds of garbage is heavier than fine ashes. Sometimes you can tell by shaking the can and sometimes you can't. When it comes winter, and there's two or three inches of snow or ice over the top of the can, a man 'll have to ram his hand down in the mess to tell what's there. And if you mix 'em in your cart you get called.

In the dark, if the cans ain't sitting out on the curb you have to hunt 'em. There's a lantern strapped onto the cart, but you can't carry that and the cans too. You grope around in black areaways, and if you miss a can a kick is sent in and you get suspended.

Some cans weigh 200 or 250 pounds. I've weighed 'em at a hospital on my route. In daytime you can get the janitor or a sweeper to give you a lift. In the night you got to lift every can yourself. Maybe you got to carry it up out of an areaway, into the street, and heave it up onto your cart. There's a

lot of drivers get ruptured that way; I'm wearing a truss myself. There ain't many drivers in the service that can't show a mark somewhere from heavy lifting. If you spill the can out on the street to shovel it up, you break the regulations. You pick off a can with a big jag in the top rim. It cuts, and you drop the can. Maybe it's two o'clock in the morning and some grouch reports you for making a noise. I've had things thrown at me out of windows.

In winter it's hard for a horse to keep his feet. If he falls down on the slippery pavement in daytime you can get a sweeper or a passer-by to help take the cart off and get him up. But who's around to help at three o'clock in the morning? One man can't take a loaded cart off a horse.

There ain't a one of these things that don't make you lose time. Usually you can't clean up your route in the eight hours you're paid for in daytime. At night it can't be done. Take my route; there's an average of ten or twelve loads a night. Each load holds twenty-three to twenty-five cans. I can't take my cart back to the stable until I haul 'em all to the dump. Since this night work started I averaged ten hours. That gets me home between six and seven in the morning. I live near my stable; most of the drivers do. You can say we all live east of Third avenue or west of Tenth avenue. You can't get any sleep in the daytime in those parts of town.

The cold weather this fall gave us a hunch how things would be later on. Size up what a blizzard in the dark would put us up against. Why, even before we struck I was wearing three pairs of socks under my boots, two pairs of pants, an overcoat, and an oilcloth coat over that. You can't do heavy lifting with that weight on you.

They say we're striking because we don't get tips at night. I tell you there's nothing to this tip talk. A stray dime or two is all the most of us pick up. Maybe it's different with the fellows that have hotel and theater districts. But what do you suppose an east sider is going to tip?

I tell you it's the night work we're sore on. We wasn't asked when night work was started. It was at the start of the hot weather and at first a lot of the men thought it wouldn't be so bad. But to-day there ain't a driver that's in favor of night work. A lot of us have got the croup already. I don't know a driver that hasn't lost from fifteen to twenty-five pounds since he started working nights. It's killing work, and we all saw what it would come to in winter. That's why we struck.

This driver's view of the trouble was repeated in substance by other strikers

interviewed. So far as a quick inquiry revealed, the strike was the spontaneous coming out of the garbage men, who thought it was the only way to stave off winter night work. Either this was true, or the labor organizers who let the advantages of pre-election weeks slip by before they called the men out bungled it or did not want to win. This was not the first strike in New York's Street Cleaning Department, however. With an organization but a month old, Local 658 of the International Brotherhood of Teamsters, comprising the sweepers, drivers, stablemen, and hostlers of the department, went out in June, 1907, demanding an eight-hour day and the abolition of the fining system then in operation. Mayor McClellan and Commissioner Craven took up the grievances; fines as penalties were supplanted by suspensions, and the eight-hour day was granted. Thus, as a piece of departmental history, these earlier improvements in conditions had come about, not through administrative initiative, but through the action of the men together in a successful strike.

STEPS WHICH LED UP TO THE STRIKE

The story of the present strike began with the change from day to night work last spring. On April 22, William H. Edwards, commissioner of the Department of Street Cleaning, ordered that beginning April 25 night collection of garbage and ashes be tested between Twelfth and Fifty-ninth streets on the west side of Manhattan, and in parts of the Bronx and Brooklyn. On June 16 came the order that on June 19—three days later—night removal would become general. The chief objections cited at the time against day removal were the odors and flying ashes stirred up in emptying the cans in the midst of the city's other activities. About one-third of the drivers, or those engaged in removing street sweepings, continued day service.

Officials of the department declare that nothing was said at the time as to how long night removal would continue. The men insist that it was generally understood among them that it would

last only during the summer months. As fall came on rumors circulated that night removal would soon cease. October 1 was the day set by the early rumors, then October 15, and finally November 1. Meanwhile discontent gathered head.

With November 1 past and night work still in force, a committee from Local 658, headed by George H. Prescott, secretary-treasurer, called on Commissioner Edwards on November 3, and made an oral request for the restoration of day work. The Commissioner told them he would take the matter up with Mayor Gaynor. Sunday, November 5, Local 658 voted to strike if night work was not abolished in response to this request. On Monday Mr. Edwards told the committee that the mayor's decision was that night work must continue. Thereat the committee carried its case direct to the mayor's office but was unable to see Mr. Gaynor until Wednesday morning, Tuesday being election day. The Mayor told the committee that night collection of garbage was popular with the citizens and that it would continue. That night, the following letter from mayor to commissioner was read at the stables of the department:

In regard to the threatened strike of the drivers and garbage collectors of your department, be so good as to notify them at once by general order to strike just as soon as they see fit. And see to it that not one of the strikers gets back into the city employment again. We can get along without them. It will inconvenience the householders for a few days, but they will stand it patiently. Let the contract system be resorted to if necessary. The city pays the men of your department the highest wages for the shortest hours; and in addition a pension law was passed for them last winter. If they think they can make the city conform to their dictation by striking, they will find themselves grievously mistaken. The city's business has to be done as the charter prescribes, and no strike can force it to be done in any other way. The city is not in the position of a private employer and able to make any terms with its employes it sees fit.

Not a few of the men, hearing of the mayor's stand in his interview with the committee at City Hall, absented themselves from roll call; perhaps two hundred went out with their carts. The

rest struck. A majority of the day drivers struck in sympathy next morning and three days later the street sweepers also left off work. The administration took the position that the men were guilty of insubordination as municipal employes, and sent out a call for 5,000 strike-breakers, pending the filling of their places from the civil service lists. When three days later (November 11) William H. Ashton, general organizer for the International Brotherhood of Teamsters, one of the leaders in this strike and in the unsuccessful strike of the express drivers last year, wrote to Mayor Gaynor offering to submit the men's case to an arbitration board.¹ The mayor did not answer the letter and refused to see the writer. Within the fortnight the backbone of the strike was broken.

STREET RIOTS AND PILED-UP GARBAGE

Meanwhile, this dispute in one branch of the municipal service was disrupting the peace and threatening the health of the whole city. Ashes and garbage accumulated faster than new men could be brought to New York from Philadelphia, Baltimore, Pittsburgh, Boston, Buffalo, and other points, and broken in to the work of removal. On the lower east side, in parts of Harlem, wherever is congestion of people, there also was menace of infection. By Sunday night the situation had become acute. There was stench throughout the tenement districts. In narrow streets, vehicles rolled hub-deep through piles of refuse. Roving strike sympathizers and bands of boys, on the street for amusement, over-tipped the cans on to the pavements. Children played in and about heaps of garbage with no one to stop them. Feeding animals attacked the putrefying matter, and a cold snap was all that saved from thorough decomposition. It was not until November 16 that a normal day's removal of garbage was effected. Then began the work of catching up with the accumulations of eight days.

¹Mr. Ashton's letter suggested a board made up of three representatives each from the Merchants' Association, the Chamber of Commerce, the Civic Federation, the Contractors' Association, the Democratic and Republican clubs, the three central labor bodies of Greater New York, the Health Department, the Anti-Noise Society, the Board of Aldermen, the Board of Estimate and Apportionment, and the men's union.

which has not yet been accomplished.

Rioting followed the appearance of the strike-breakers in the streets. These were heavily guarded by police, mounted and unmounted, who had orders to use their clubs. Sunday afternoon, November 12, a half brick thrown from a roof in the San Juan Hill neighborhood tore a scalp wound in the head of Chief Inspector Schmittberger; a mob of 2,000 quickly gathered, and was as quickly routed by a general police attack. Later Inspector Schmittberger said:

This dropping of missiles from roofs and upper-story windows is a new style of warfare in the history of New York. We have had isolated instances, but never before did the batteries of a whole block of tenements open, as if by signal, upon those in the street. Our foe was unseen. We met it by a new kind of police duty—roof patrolling: For several days my men patrolled the roofs ahead and on each side of carts manned by strike-breakers. They came upon pile after pile of chimney bricks and copings heaped at the street edge for instant toppling.

One other such crowd gathered on this, the critical Sunday of the strike. For the rest the riots were small; but many cases of attack upon strike-breakers were reported. The only fatality known to the police was the killing of Ferdinand Bublitz, alias Robert Moeller, struck by a portion of a chimney purposely toppled from a roof. Bublitz was not a professional strike-breaker but had been out of work for six weeks and took a job on a cart. He was twenty-three years old and leaves a widowed mother who depended upon him for support. Police records show twenty-six injuries as the result of strike rioting. Four were serious—concussion of brain, fractured shoulder, broken skull, and shock from fall. Fifteen of these cases were strike-breakers; seven were policemen. No official data is available as to rioters or pedestrians injured by the police charges.

Like a private employer the city faced the usual problem of housing the men brought in to break the strike. Forty-five hundred blankets, as many cots, and commissary utensils for half that number were purchased. 3,085 men were housed in twelve stables in Manhattan and the Bronx. A midnight visit to a stable on the upper east side

found 278 men sleeping on the city's cots. The third floor, used ordinarily for storing harness, feed, etc., was given up to 200 Negroes. The wet from the single lavatory in a corner overran the nearby floor. In the cellar sixty horses stood in their stalls and seventy white men slept on cots, some of them not four feet from the horses' tails. A long low-roofed passage, without ventilation, was choked with twenty cots. Other stables visited showed conditions less cramped. In nearly all food was cooked and eaten within doors.

The city paid the detective agencies and other labor contractors \$5.75 per man per day, the agency supplying food and wages out of that amount. Transportation of strike-breakers, food, sleeping and commissary equipment cost the city \$136,000 during the first six days alone.

STANDING OF STREET WORK

In direct financial loss, in disturbance, and in danger to the public safety, this strike almost immediately concerned the interests of the whole community, although only a handful of men were involved compared with those called out in a strike in any one of a score of building or manufacturing trades in New York. More than that, it concerned the status of municipal employes as strikers, and as such involved questions affecting the civil service in all its branches. The civil service examination to which a street cleaner in New York is subjected calls for sound physical condition and the ability to wield a fifty-pound dumb-bell. Commissioner Edwards early began to fill the vacancies created by the strike from civil service lists. Application blanks were distributed among the strike-breakers and the best among them were encouraged to fill these out. The Municipal Civil Service Commission had furnished Mr. Edwards with 9,500 names of previous applicants, to whom notices were sent. A relatively small portion of these responded; but on November 20 the department announced that it had 922 civil service men on its pay roll. Commissioner Edwards said:

The status in the department of the civil

service men who struck is this: They are suspended, without pay, under charges. These men cannot be dismissed until they have had an opportunity to answer to charges, nor can their places be filled until they have been dismissed. This department has the names of about two hundred men who remained loyal. None of the others will get back.

Each man received a notice directing him to appear November 20 to answer to the following charges:

Absence from roll-call November 8; refusal to go to work November 8; conduct prejudicial to good order and discipline, in that he left his work in concert with others, intending to cripple the department; disobedience of orders in that he refused to go to work November 8.

Over 1,000 men reported at this hearing. Newspaper reporters were barred; the men were ushered in by stables; the "trials" averaged twenty seconds per man. Decisions were reserved.

The opinion of the Municipal Civil Service Commission, said Frank A. Spencer, its secretary, is that Commissioner Edwards has been within legal bounds in all that he has done. Paragraph eleven of Rule Nineteen of the Municipal Civil Service Rules reads:

In a case of emergency where it is not practicable to secure laborers from an eligible list with sufficient promptness, or where a list is temporarily exhausted, an appointing officer may hire . . . for a period not exceeding five days as many persons as may be required. . . . The emergency continues, in Commissioner Edwards' view,

as long as the department is crippled. Therefore it is legal to hire outside men over again at the end of each period of five days.

So far as general terms of employment go, the pay roll of the Street Cleaning Department has shown a rather steady increase in the wages of the men since 1892. Under the present schedule, (the last change being in 1909) drivers and hostlers receive \$800, the former with twenty-five cents per hour and the latter with \$2.30 per day as extra compensation for Sunday work; sweepers receive \$780 and stablemen \$760, each with twenty-five cents per hour extra for Sunday work. Last September two petitions were presented by the union to the Department of Street Cleaning asking for an increase to three dollars a day in the wage of steady and

extra drivers, sweepers, stablemen, and hostlers. Commissioner Edwards recommended such an increase to the Board of Estimate and Apportionment, but it was not allowed, and the men appear to have dropped their demand after the final budget for next year was approved.

Three further points with respect to terms of employment should be noted: In declaring that any decrease in tips had nothing to do with the desire of the men to change to day work, the strikers contradict a view put forth freely in the press that drivers habitually demand remuneration from tenants and janitors. An official of the department said that he had the name of one middle-class hotel which regularly gave fifteen dollars a month in tips to a driver. A canvass of two residence blocks on the middle east side, where four-room apartments rent for from \$18 to \$25, discovered no evidence of continuous tipping. Many janitors stated, however, that they tipped when an extra service was asked. On October 1 the provisions of a pension law passed last summer by the state legislature were put into effect. Varying amounts are paid from this fund to disabled employes, and to the widows and children of killed employes. Employes in the service for twenty years or more who have reached sixty years of age are granted pensions amounting to not less than half of their compensation when retired. "The practical effect of this pension scheme," in the view of some of the drivers, "is simply to deduct 3 per cent from our wages. Very few drivers reach the age of sixty years in service. The work calls for younger men."

On the other hand, there are opportunities for rising in the departmental service. Above the labor grade, each vacancy must be filled by promotion on examination. In this way 259 drivers were raised to assistant foremen the past year.

ISSUES RAISED BY THE STRIKE

Such, in brief, are the main facts of the public service strike which has agitated New York the past fortnight.

Certain phases of the situation have received comparatively little attention. The first is that the change of any line of work from day-time to night dislocates the normal habits of life for the men involved and their families. Night work means abnormal household living, and there would probably be consensus of opinion that the burden of proof is on the executive, public or private, who would establish it that the advantages to be gained more than counterbalance these very apparent evils, and that the change is the only method to secure those advantages. A critic of the administration states:

In numberless cities of Europe garbage is collected by day without nuisance through the use of covered carts different in design from those employed in New York. A change to any of these systems would require the scrapping of the present New York equipment at a cost running into the millions; but in the opinion of experts who have been studying the question in connection with the Metropolitan Sewerage Commission it would prove its worth in the long run. The present system is regarded by these sanitarians as neither scientific nor even civilized, and viewed from this angle the strike hinges not on the institution of progressive methods, but on the night work involved in a belated sanitary régime. Moreover, it is customary in many employments demanding night work to arrange alternating weeks of day and night shifts, and if this is not done the day turn is allotted, as in a sense a promotion, to the older men. No such adjustments were made by the city in instituting the night work in garbage removal, and no increase was made in pay for the night work.

In the second place, the events of the strike may be viewed from the standpoint of the public estimation of municipal employes of whatever rank. That the men struck in haste, within a week after making their first demands on the mayor; that they recklessly jeopardized the well-being of every tenement dweller in New York; that they resorted to intimidation, riot following on its heels—these are charges reiterated with force by the New York newspapers. There has been less clear statement as to whether the attitude of the city administration tended to break down or build up the morale of the garbage men. In denouncing the union strikers and their officials the tone of the editorial columns

themselves has indeed been rather that of choleric old butlers exasperated at a flare-up among their scrub-women. In earlier days, section foreman and district superintendents of the street cleaning department were peace officers, and during the present strike Commissioner Edwards suggested that if his men were made health officers they would feel a larger responsibility and petty complaints by householders would be reduced. When Col. George E. Waring came into office as street cleaning commissioner in 1895 he definitely set out to raise the standard of the service and to give to the street cleaner a higher personal dignity. In his own words, he put a "man instead of a voter at the other end of each broom handle." In spite of cartoon and caricatures he adopted uniforms—"white wings"—established an annual parade, started boys clubs and illustrated talks in the public schools, all as part of his plan to secure a new sort of public interest in the important work of this department.

COL. WARING'S METHOD OF GRIEVANCE BOARDS

That part of Colonel Waring's experiment of most interest today was the development of a plan of internal arbitration for the peaceable settlement of grievances. Briefly the scheme was as follows:

The sweepers and drivers in each of the thirty-two section stations and each of the nine stables elected one of their number to represent them in a General Committee of Forty-one. This committee elected five spokesmen to represent it in a Board of Conference of ten members, the other five being the commissioner's representatives. Meeting once a week in secret the Committee of Forty-one discussed "with perfect freedom everything connected with their work, their relations with the commissioner and his subordinates, all questions of discipline, duties, pay, etc., in which they were interested, or which their sections, stables, or dumps may have submitted to them." The Board of Conference met monthly. Such questions as it could not settle "to the satisfaction of all" were argued by its chairman and secretary before the commissioner, who then rendered a verdict. A sweeper was elected chairman of this board.

During its first year the Committee of Forty-one considered 345 separate matters, of which 124 were referred to the Board of

Conference, the others being settled satisfactorily by itself.¹

The Waring plan of grievance committees has long since been abandoned, and the present strike has apparently hinged upon peremptory decisions made by the city's chief executive. The change from day to night work was made last spring on three day's notice, without consulting the men or interpreting it to them. This fall the mayor refused to consider the question open or arbitrable when the union committee called. Instead of seizing the situation as an opportunity for the city to demonstrate to private employers that industrial disputes can be settled off the public streets, his message to the stables that the men should strike when they saw fit merely provoked bad temper, and was in striking contrast to the methods employed by Colonel Waring in building up *esprit de corps*. The crux of the matter lay deeper, however, in the fact that, for men who as a body felt themselves unjustly treated, no channel was open but to quit the service—or strike. To meet this situation, Dr. Henry Moskowitz, member of the Joint Board of Sanitary Control of the Cloak, Suit and Skirt Makers' Industry urges the creation of a municipal grievance committee² to hear petitions from all grades of city employes. Dr. Moskowitz states his plan as follows:

A small unpaid body of this sort, appointed by the Board of Estimate and Apportionment, with power not to grant demands but only to make public its opinion of their justice, would be capable of impartial verdicts, and would discourage extreme measures by employes. A strike must have public sympathy to win. An adverse report from such a committee would rob any set of demands of public sympathy and a favorable one would go far toward inducing their satisfaction by the city. Confidence in such a body would give to municipal servants a collective entity not otherwise possible.

¹Concerning the attitude of the men toward this plan Thomas A. Doe, chief clerk of the department and secretary of the board of conference, wrote: "From the beginning it was evident that a large number of the men had a full appreciation of the purpose of the plan. . . . A false impression obtains among the public that the drivers and sweepers are below the average in intelligence and acumen. This is not the case. A glance at the faces of the members of the Committee of Forty-one would quickly dispel this illusion."

²See reference to English grievance boards and a general review of the strike by Henry Phillips. P. 1260.

ARBITRATION PLAN WITH AN ENACTING CLAUSE

According to reports from the Chicago Women's Trade Union League, the arbitration plan which came into force through the settlement of last year's strike of the garment workers employed by Hart, Shaffner, and Marx is operating satisfactorily; but to the league's mind its success is in no small part due to the strong organization of these workers which has been developed since the strike.

On November 6 seven hundred employes in three shops were discharged, without warning, although but a few hours before two union officials had been in conference with one of the members of the firm. At the time of the discharge and afterward, the firm stated that the action had been taken because of a decision to give up the location of these shops. The arbitration committee, consisting of Carl Meyer, representing the firm, and William I. Thompson—Mr. Thompson taking the place of Clarence Darrow, who is in Los Angeles—representing the workers, met at once and succeeded in bringing about a satisfactory adjustment, whereby those discharged were to be taken back by foremen at other shops of the firm.

The readiness with which this adjustment was reached bears a close connection, as the union leaders see it, to the fact that 5,000 garment workers in the employ of the firm have joined the union. The work of organization is now to be extended to the employes of three other large clothing concerns.

CO - OPERATIVE HOMESTEADING

The Homestead Commission appointed last spring by Governor Foss of Massachusetts has made public a tentative bill designed to aid city workingmen in acquiring small homes in the suburbs. The commission will report to the Legislature early in January and in the meantime it desires constructive suggestions in preparing the final draft of the bill. The latter calls for a permanent commission of three unpaid members, to be appointed by the governor; these to be

assisted by a paid secretary. They would be authorized to purchase, lay out, and build upon tracts of suburban land for the purpose of providing homes for workingmen.

Each person holding property in these tracts is to own at least five shares of stock at a par value of \$10 each, the total amount of out-standing shares not to exceed the total amount loaned to the commission by the state. The treasurer of the commonwealth is authorized to loan the commission such sums as are necessary for the purpose of the act, from funds deposited by the savings banks in the state treasury. In return the commission is to give notes to the treasurer, to bear interest at 3 per cent, and to mature not later than thirty years from the date of issue, the principal to be paid in annual instalments, but in no case earlier than January 1, 1918.

These notes are to be a first lien on all real estate, except such as may be released from time to time by individual purchasers, in which case an equivalent amount shall be paid into the treasury of the commonwealth. The amount of any note when paid may be re-loaned to the commission, provided, however, that the amount of all notes outstanding and unpaid at any one time shall not exceed \$300,000. On all the stock issued the commission is to declare dividends based upon any net earnings over an amount sufficient to establish a contingent fund for the improvement of the property, and after the payment of interest, expenses, repairs, and any assessments for water, sewage, sidewalk, street lighting, or other public improvement purpose.

The tentative bill further provides that as soon as the number of certificate holders is, in the judgment of the commission, large enough for the purpose, a meeting of stock-owners shall be called to elect officers and adopt by-laws to be approved by the commission. The commission responsible for the tentative bill consists of Eva W. White, Charles F. Gettemy, Arthur B. Chapin, Kenyon L. Butterfield, Clement F. Coogan, Henry Sterling, and W. D. Foster.

FEDERAL ACTION AMONG CHURCHES

Thirty-three representatives of seventeen denominations responded to the call for the inter-denominational conference at Chicago, November 8, issued by the Commission on the Church and Social Service of the Federal Council of Churches of Christ in America. Two branches of the Baptist Church were represented, three of the Methodist, two of the Presbyterian, two of the Reformed, the Congregational, Disciples and Christian, German Evangelical, Mennonite, Protestant Episcopal, the Society of Friends, and the United Brethren. The attitude toward co-operative work and the organization for social service reported on behalf of the denominations represented was hopeful for the future, if not definite in the statement of present achievement. The need of literature adapted to inspire and inform the awakened interest in social work was acknowledged by all. A series of brief handbooks, leaflets, reading courses, labor Sunday orders of service, and social service programs for the use of local churches in their respective communities, as proposed by the Literature Committee, was widely favored.¹ The discussion elicited the desirability of "a social gospel for the foreign missionary field," to meet the needs of an awakened social conscience in the East.

Special state conferences were thought to be necessary to carry out the policies and suggestions for constructive action which the Social Service Commission may present from time to time. Various suggestions were offered by the delegates for immediate co-operative effort in local communities. It was proposed that those social service officers whose work for the denomination is of an executive nature shall compose a secretarial cabinet, under the chairmanship of the secretary of the Federal Council's Social Service Commission. The latter was designated as the representative of all those denominations which are with-

out such executive officers on social service.

The following specific recommendations for immediate social service were accepted: increased provisions for teaching and training theological students for social service; the education of church people and ministers through social service literature; the campaign for one day of rest in seven; a living wage and reasonable hours of employment for all workers; the betterment of social conditions in rural communities; the regulation of child labor and women's work. The peace propaganda and reform in prisons and almshouses and other public institutions were suggested as means of interesting in social service those who are not ready to enlist in efforts for industrial betterment.

ORGANIZING THE FIGHT AGAINST UNEMPLOYMENT

Concerning itself chiefly with matters of organization and program, the Committee of the International Association for the Fight Against Unemployment met this fall at Ghent. The first conference of this international body was held at Paris, September, 1910, and the second will be held in 1913 at Ghent, the city which, under the leadership of M. Varlez, has made bold experiments with insurance against unemployment.

The meeting of the committee was attended by members from all the principal countries, many of them sent by their governments or by city councils. America was represented by a single volunteer, Prof. Charles R. Henderson of the University of Chicago. The committee considered:

What should be done in respect to the form of affiliated national organizations and their by-laws; the financial plans of the international association; the establishment of new sections; recruiting new members; subsidies from governments; financial report and budget; changes in composition of the committee; the committee meeting for next year at Zurich, Switzerland, with other related organizations—protective legislation, insurance, etc.; the next international conference in 1913; the conduct of the *Revue Internationale du Chomage*; and the program for future action.

Max Lazard, of Paris, was authorized to continue the publication of the *Revue*, the first number of which gives a sum-

¹All requests for literature and information regarding the federation of churches may be addressed to the offices of the Federal Council, Clarendon Building, 215 Fourth avenue, New York city.

mary of the situation in Europe in its latest phases. The proceedings of the first conference have been published in three volumes, the papers and discussions being printed in English, French, and German. They may be procured through the American Association for Labor Legislation.

Of the movement in this country Professor Henderson writes:

The officers of the association earnestly urge friends of the movement in the United States to form a national section. The American Association for Labor Legislation is the natural center for directing this effort, and anything done should be in closest cooperation with our recognized leaders. It is hoped that arrangements can be made for forming an organization so that we can be represented in the international association and can have an effective organ for securing progressive action in this country. Any one can become a member and be entitled to receive the publications on payment of ten francs per year. Societies pay twenty-five francs and public bodies fifty francs. Until an American section is formed all dues may be sent to the American Association for Labor Legislation.

HEBREW CHARITIES AND SELF-HELP

During the past year a Committee on Advice and Information to Widows has been organized by the United Hebrew Charities of New York to meet a need created by the small insurance sums left to their widows by the majority of Jewish husbands. These amounts, usually ranging from \$300 to \$500, are easily spent. The committee aims to give such advice that this money may enable a widow to earn a livelihood. Another new line of work has been in cooperation with the Bureau of Licenses with respect to the issuance of push-cart permits. The society has been able to put a considerable number of applicants on a self-supporting footing by furnishing them with stock at comparatively little expense. The work has brought the society into touch with the whole problem of street peddling and the plans under discussion for the gradual abolition of such traffic without hardship to those who ply the trade. Such a plan has received the written approval of the mayor, other city officials, and a number of social and civic organi-

zations. The United Hebrew Charities intends to continue its efforts to secure the necessary administrative action that will put this plan into effect.

Of the general problem faced by the relief department of the society the following statement was made at the recent annual meeting:

We find again that the factors which make for dependency are largely forces over which the unfortunate applicants have no control. Our figures show, as in the past, that crimes and intemperance play no appreciable part in the sad drama of human lives which we see unfolded. Sickness, old age, accident, widowhood and orphanage, desertion, unemployment, and insufficient earnings—these uniformly stand out as the *causae causantes* of dependency. With one exception, these causes of dependency operated in the same degree as in the previous year. During that year tuberculosis afflicting the breadwinner required aid to the extent of approximately \$32,500, or 14 per cent of the total relief disbursements, whereas during the past year it necessitated the expenditure of \$49,500, or 20 per cent of all the cash relief distributed. This but confirms the impressions of our relief committee and workers that this scourge is steadily making headway. Whatever may be its origin, there is no doubt that overwork, congestion, and undernourishment form the soil upon which it thrives. The conviction is growing upon those engaged in combating the disease that, notwithstanding efforts to disseminate a knowledge of hygiene, the only hope lies in a radical change of working and living conditions. Factories must be made sanitary, tenements must be made habitable; children must be given room in which to play; men and women must not be overworked and underpaid—otherwise society in all its strata will have to pay the penalty.

NEW YORK BUREAU OF SOCIAL RESEARCH

The discussion of the district as a city unit at the annual public meeting of the New York Charity Organization Society was made the occasion for a review of the work carried on the past two years by the Research Bureau of the New York School of Philanthropy in connection with the Clinton district of the Charity Organization.

The research bureau fulfills a double purpose. It gives an opening to students in social investigation and at the same time, with the help of the more experienced members of its staff, it makes its studies of immediate value to the active remedial agencies of the city.

When it was first proposed to make a

social survey of one neighborhood in the great city, to act as it were as the investigating arm for one district, it seemed an almost impossible undertaking, said Pauline Goldmark, director of the bureau. She continued:

How could one attack anything so enormous as a survey of all the factors that have produced the life of the city today?

The very size of the city is enough to daunt the most fearless. The daily spectacle of New York, the relentless maelstrom of its business life, the interminable stream of traffic, the seething subways and overflowing tenements, the storms of rebuilding that are remaking the face of the city—in a word, the unprecedented speed of economic and social changes—who could have the power or the skill to grasp them all?

Even the device to break up this giant into manageable parts, to take one section and to study that, at first appeared impracticable. Was it possible to unravel and understand the problems of any one neighborhood considered apart from the rest of the city?

Now, after taking the initial steps, there is little doubt that this plan of work is perfectly feasible. It becomes apparent that a patient study of one locality, its peculiarities and needs, its antagonisms and prejudices, prepares the basis for well considered and effective social work.

When one gets down to business, one begins to discover that even the city government, which supposedly serves all alike, has to be studied from the neighborhood point of view. Municipal housekeeping—street cleaning, removal of ashes, snow, etc., the police and ambulance service—does not deal with all sections impartially. For instance, why is it that in our section we sometimes have to wait two hours for an ambulance call? Why is it that thefts and burglary are committed in broad daylight and that gang fights make our streets impassable without calling forth the effective interference of the police? Those are some of the questions which we set ourselves to answer.

If we are to find out why such conditions have arisen, if we are really to understand the intertwined and intermingled causes which have made our neighborhood what it is today—to a large extent neglected, poverty-stricken, lawless—obviously the most detailed knowledge of and intimacy with the district is essential.

The bureau went back to historical development of the quarter. New York conceals its history well instead of parading it; and it took a long search to discover the original settlers of the land, the German and Irish immigrants who followed, to trace the coming of the industries, the sudden growth of population, its racial elements, and the hurried

building operations in the 70's which bequeathed to us the wretched tenements of that period. More significant still is the history of that old lawlessness which has showed itself ever since the draft riots of 1863 and persists to the present day.

Handicapped by this social heritage, what are the citizens of today? What kind of homes do they live in, what are their standards of morality and conduct, their pleasures, and their vices? What are the special factors that interfere with their well-being and how heavily do they bear upon the different levels of the community?

These are some of the problems the bureau has set itself to interpret in stating the needs of this neighborhood as distinguished from any other working-class section of the city. To begin with, it naturally attacked some of the immediate questions that are baffling social workers, in order to give information or open up new points of view that will make their work more intelligent and better focused. For instance, said Miss Goldmark, there are the new immigrant groups, Italian and Slav, who are adrift in the community. Their lack of acquaintance with American institutions and standards is a distinct menace to their girls and young women. The change to industrial life outside of the home, the possible dangers in the factory and the streets, for instance, need to be carefully explained. The social worker sees the apparent indifference of the Italian parent to the welfare of his children, such as the failure to send his children to school regularly and lack of intelligent interest in the activities of his sons and daughters. All these things need to be considered with a due appreciation of the foreigner's difficulties in adjusting himself to his new environment. The social worker who deals with the foreigner should understand them and give advice based on this knowledge.

MANAGEABLE UNITS ARE NEEDED IN SOCIAL WORK

Opportunities for work in the neighborhood have been studied and of these Miss Goldmark said:

We ought, if possible, draw up a white list and black list of factories, which will give the agencies the necessary information to guide their girls in the choice of an occupation. In place of the present haphazard and unintelligent method of getting work, we ought to be able to tell a young girl where she will work under good conditions, where positions are permanent, and where advancement is assured for competent workers. To take an illustration from our neighborhood: for many years girls and women went as a matter of course into the so-called Hammock factory, where conditions of work were undesirable in every way. This factory violated the child labor law, women worked over-time at exhausting occupations, and yet no one in the neighborhood interposed or seemed to appreciate that other more desirable occupations should be found for the workers who were too defenceless to help themselves. This factory has now given up business, but there are many other places which ought not to be recommended. It is certainly one of the obvious duties of any one interested in the welfare of this neighborhood to take an active part in finding the best sort of occupations for these young wage-earners and to protect them from exploitation. There are, for instance, good positions for young boys in the piano factories. This is the largest man-employing industry in the district, and young boys should be encouraged to enter this occupation and submit to the years of training and slow advancement that will ultimately place them in highly paid positions, rather than yield to the attraction of the vagrant occupations—messenger and delivery service, etc.—which at first seem to offer better wages but which lead to constant change of occupation and consequent demoralization.

Our study of juvenile delinquency probably shows more clearly than any other part of the inquiry the need of special intimate knowledge of social conditions. It shows also the failure to knit together all the social forces of the community in order to check overlapping of effort and make neighborhood activities really effective. The Children's Court in Manhattan as we all know urgently needs better investigations on which to base court action. At present it cannot even take advantage of the information about families which is available in relief and church records. It has no connection with the schools, whereby it could be informed about the gangs of toughs in the neighborhoods, the ring-leaders who lead the boys of the block into trouble, etc. Arrests are made hit or miss, and very often the judge is forced to act blindly, since he receives no proper report of the family or neighborhood situation. It is obvious that the work of the court could be greatly strengthened and improved, if a probation officer specially appointed to work in a given district were able to report on each case, with a full knowledge obtained from every one acquainted with the family—for instance, from school, church, relief agen-

cy, settlement, club, etc. The present system of indiscriminate arrests, which often fails to bring into court the ring-leader who is responsible for the disorder, the innumerable arrests for petty offenses or for playing in the streets, seem so unreasonable to the neighborhood and have aroused its antagonism so often that the influence of the court is seriously undermined. The Children's Court in New York, which ought to be known in the community as a friend of the children, is unfortunately considered nothing but a vague authority in league with the police, which arrests a boy for playing in the street as well as for more serious lawlessness, which may send a boy up to an institution. But its real purpose is entirely unintelligible to the neighborhood.

In the light of a year's investigation, we believe that an agent of the court, working intelligently in this neighborhood, could bring the real offenders to arrest, and could do much to correct the present unfortunate attitude of the neighborhood towards the Juvenile Court.

This discussion of the significance of working in small units, Miss Goldmark pointed out, should not be understood as an attempt to make our social organization more complex.

If we are to keep our problems within bounds, if we are to prevent their outstripping human ability to deal with them, we must break them up into manageable units and get close to the actual causes underlying them. As Arnold Bennett says: "When one has thoroughly got imbued into one's head the leading truth that nothing happens without a cause, one grows not only large-minded but large-hearted."

INVESTIGATION OF AUSTIN DISASTER

Three weeks of inactivity and silence followed the first brief session, on October 6, of the coroner's jury charged with fixing the responsibility for the loss of life when the Bayless Pulp and Paper Company dam broke at Austin, Penn., September 30. As told in *THE SURVEY*,¹ the inquest was adjourned indefinitely when the superintendent of the Bayless mill refused to testify, the district attorney saying that he desired to ascertain his authority to compel testimony.

Suspicion was current that the investigation would be quietly dropped, or carried out only in a perfunctory way.

¹A Man-Made Flood: Some Issues in Social Responsibility Raised by the Breaking of the Dam above Austin, by Graham Komeyn Taylor. *THE SURVEY* for November 4, 1911. Price 25 cents.

Significantly, the announcement that it would be resumed on November 2 appeared in the public press at the same time that the following letter, signed by the governor of Pennsylvania, was published:

Commissioners of Potter County,
Coudersport, Pa.

Gentlemen:—Information has come to me that there is a disposition to halt the inquiry now being made at the coroner's inquest into the cause of the breaking of the dam at Austin, which resulted in such great loss of life and property. The duty being imposed upon the county authorities to make such an investigation and the extent of the calamity being so great, not only are the people immediately affected interested, but the citizens of the entire commonwealth are much concerned.

I hope therefore, and urge, that no reasonable expense be spared, and that nothing be permitted to interfere with the prompt and conscientious discharge of the duties of investigating and determining the cause of the dam breaking and the responsibility therefor, if any.

Please furnish me all information brought out in investigation to the present time and full report upon its completion, and oblige,

Respectfully yours,

JOHN K. TENER.

The session on November 2 was brief, and again an indefinite adjournment was ordered until such time as the designing engineer, T. Chalkley Hatton, could be present. A letter stated that he could not attend until December, but would then be willing to testify. The hearing, however, brought out some important engineering testimony by Prof. Frank P. McKibben, of Lehigh University, and Prof. Alfred D. Flinn, of the Department of Water Supply of New York city. Prof. McKibben is reported to have declared that the foundation was faulty, that the construction was poor in a number of respects, and that the dam was very unsafe whenever more than half filled with water. While he found some evidence of a puddle bank to keep water from going under the dam, he could discover no trace of a cut-off wall to prevent entirely such percolation. The testimony of Professor Flinn corroborated that of Professor McKibben.

This evidence is reinforced by a statement issued on October 30 by the conservation commission of New York

state, following an examination of the Austin dam made by its inspector of dams, Alexander L. McKim, who declares that he could find nothing to indicate the existence of a "key" or cut-off wall which, according to the drawings, should have reached the entire length of the dam, extending four feet down into the rock and having a thickness of four feet. It will be recalled that the article in *THE SURVEY* for November 4 stated that *Engineering News* had received intimation that the engineer's original plan to carry a cut-off wall deep down had been over-ruled on account of the expense, and, moreover, that the plans and recommendations submitted by the engineer after the partial failure of the dam in January, 1910, had provided for a cut-off wall deep enough to reach impervious strata. *THE SURVEY* pointed out that according to representatives of *Engineering News* and *Engineering Record*, who visited Austin after the disaster, nothing had been done to carry out these recommendations. It is stated that Mr. McKim found that at least one portion of the dam which published drawings showed to be thirty feet thick at the base was actually only twenty feet thick.

At the session on November 2, George M. Miller, a contractor of Kane, produced letters which had been written to him in 1910 by President Bayless concerning the re-inforcement of the dam. According to the report one of them mentioned a four-inch stream that leaked beneath the dam and asked if certain work could be done, as "we must make this dam safe to satisfy the people of Austin."

BUSINESS AND THE WAGE-EARNER

The possibilities of business for the wage-earner and the responsibilities of business for the capitalist were the topics of the annual meeting of the New York Academy of Political Science on November 10 and 11. The pros and cons of government regulation of the trusts as a substitute for anti-trust legislation were discussed at the dinner meeting on the final evening by Frederick W. Whitridge, George W. Perkins,

John Hays Hammond, and Robert Walker, general counsel of the Chicago, Rock Island, and Pacific Railway.

Labor legislation, to those who took part in the first day's session, meant legislation to protect the lives and health of laborers. The responsibility of the state inspector toward such legislation should, in the opinion of P. Tecumseh Sherman, who read the first paper, include recommendations for its improvement, and should include, also, a program of education among employers on the best means of safeguarding their workers. For this educational work the inspector would have to be an expert. Such legislation should not be voluminous; it should not unduly burden industry, but should be limited to safeguards whose usefulness had been fully demonstrated. Further safeguards the employers could be trusted themselves to supply if a compulsory compensation law held them financially accountable for injury to their workmen.

That, even aside from this financial incentive to safeguard life, there has within recent years developed a sense of responsibility in employers, which has gone along with the improvement of labor laws and labor departments, was the theme of the address by John Calder, general manager of the Remington Typewriter Company. He pointed to the employment of experts and the installation of insurance plans by large industries and urged that the work of protecting life be begun early, by offering courses on safety in the engineering departments in colleges. He held that safety, sanitation, and the limitation of hours were but so many means of increasing working efficiency. At a later session Raynal C. Bolling described the means by which the United States Steel corporation had cut its accident rate in half.¹

Prof. Henry R. Seager called for support of the constitutional amendment introduced into the New York legislature to extend the police power of the state so as to bring compulsory compensation legislation within the scope of

the constitution. Professor Seager outlined the history of the Wainwright Commission's law. Another means of satisfying constitutional requirements was outlined by Miles Menander Dawson in his advocacy of national insurance. This, he argued, was from humanitarian, economic, and constitutional points of view the best form of compensation. He advocated the full German system carried on through employers' mutuals, as he believed that state or national insurance departments have many of the limitations of private industrial insurance. This plan of social insurance was defined by another speaker as "insurance where the company does not make anything." Edward T. Devine and Dwight Morrow, though not out of sympathy with Mr. Dawson's ideals, expressed belief that it would be best for the several states of the Union to try different methods of meeting the accident compensation problem, and by practical experimentation thus arrive at a permanent solution.

SOCIAL EFFICIENCY IN OUR BUSINESS

The preservation of the health of workers was the topic of the second session. Irving Fisher, who introduced the subject, contrasted the economic gain to society as whole with whatever economic loss might come to individual employers through regulation of conditions of work. He pointed out that a revolution in health has taken place, through changes in personal habits and through the work of health departments, but that in America this revolution has not yet spread to working conditions, and instanced the fact that America was not represented in the industrial hygiene exhibit at the recent Dresden exposition. He believed that hygienic working conditions would on an average lengthen life from one to two decades.

Lillian D. Wald, of the Nurses' Settlement, and Jane Seymour Klink, welfare manager of the Pilgrim Laundry, described the medical and the personal sides of welfare work, and Mrs. John Hays Hammond told of the work of the Woman's Welfare Department of the Civic Federation.

¹Steel and Steel Workers in Six American States—Illinois: Boosting for Safety. by John A. Flitch. THE SURVEY, November 14, 1911.

Average present-day sanitation and ventilation of factories were described by George W. Price in terms of the little boy's composition on Christmas presents: "I don't have no Christmas presents." The figures he gave from his many years' experience as factory inspector and as expert for the Joint Board of Sanitary Control of the Cloak, Suit, and Skirt Industry and for the Factory Investigation Commission bore out the truth of his picturesque comparison.

John B. Andrews told of the movement to cut down our annual sick list of 13,000,000 persons from occupational diseases, which was inaugurated by the American Association for Labor Legislation with the Congress on Occupational Diseases at Chicago in 1910. W. Gilman Thompson discussed the best method of working out a system of public reporting of industrial diseases.

STOCKS, LOANS, WAGE-EARNERS

The program of the last session, on financial facilities for the wage-earner, contained material that was new to most social workers, in William E. Harmon's scheme for investments on the installment plan. Mr. Harmon advocated a central board of prominent financiers, which should, like the insurance companies, employ agents to solicit business from small wage-earners. This money would then, without the expense of further intermediary, be invested in the best paying stock, thus yielding 6 to 9 per cent interest to the small investor, who is to-day practically shut out from any more profitable investments than insurance or the savings bank. Such a system as Mr. Harmon advocated is at present in existence in France and would, he held, in this country as in France give public ownership by purchase instead of by confiscation and tend to counteract revolutionary tendencies, to unify the interests of labor and capital, and to make us a nation of conservatives. Issac N. Seligman and Henry R. Mussey took part in the discussion of Mr. Harmon's paper, the former pointing out practical difficulties, the latter criticising the plan on the

ground that the public ownership conferred would not give democratic control. The control would lie, he held, just where financial control lies now, and the hands of the great financiers would be measurably strengthened.

The discussion of remedial loans (chattel and salary), was opened with the constructive plan outlined by Arthur H. Ham. On the one hand he advocated that the rate of interest in the pawnbroking business be brought down by organizing such semi-philanthropic establishments as the Provident Loan Society to compete with commercial loan enterprises. On the other hand, in dealing with salary loan evils, he recommended the regulation of interest charges (a generous rate being allowed, however, to compensate for the great risks of the business) coupled with the inauguration of cooperative enterprises. Mr. Ham's paper was supplemented by the account given by Raymond B. Fosdick, New York commissioner of accounts, of his practical inquiry into salary loans among city employes. Pierre Jay, former Massachusetts commissioner of banking, outlined a model form of cooperative loan society, and S. T. Simmonds described the practical workings of the Celluloid Club, a savings and loan association among the employes of a single factory which has in the six years it has been in existence loaned \$25,000 and sustained losses amounting only to \$50, the only security on which loans are based being the personal responsibility of the borrower.

ST. LOUIS, WATER METERS, AND RED RAGS TO BULLS

The water works of St. Louis have long been run and owned, and run successfully and with profit, by the municipality. A fortnight ago the water commissioner announced to the public that water meters would be installed in all residences and that the present flat rate system of charging for water supply would be abolished. By evening of the day that this announcement was made, the public was making stormy opposition to the proposed measuring of its water supply. Water Commissioner Wall's

name, known to few the day before, was in every street-car conversation. In a day or so organizations began to pass resolutions; arguments against the change accumulated and appeared in the press in editorial, news item, and letter-to-the-editor columns.

The commissioner defended himself. His only thought, he said, was for economy. There is a waste, he stated, of 25 per cent, amounting to \$120,000, annually; in tenements especially taps are left running in cold weather to prevent pipes from freezing and bursting; several times last summer the maximum pumping capacity was reached; if meters are not installed soon, the water works will have to be enlarged by installation of more pumps. For authority to make the change he quoted a certain permissive ordinance; and the Board of Public Improvements stood with the water commissioner for the universal use of water meters.

SURVEY readers will be interested, however, in the loud chorus that surprised the commissioner. Economy! The water works department shows a big surplus. This can mean but one of two things, it was argued—that rates ought to come down or pumping and distributing facilities go up. It is wicked for a town to make money out of water, one of the prime needs of civilization! Our population is increasing. Install more pumps. Be prodigal in the use of water, else what avails it that our city has at its command the limitless water of the Mississippi and Missouri rivers? Install more pumps. Anyway, installation of the required 100,000 meters would cost \$2,050,000 and increase our taxation and perhaps our rents. It is not waste to water our lawns, fill our tubs, etc. Plenty of water is a necessity to health and beauty. As for the tenement taps left running in winter, the only time when consumption of water crowds pumping capacity is summer. The closing of faucets in tenement-house kitchens in January is not going to raise pumping capacity in July. Increase the horde of the Great Unwashed? Never!

And the water commissioner, still astounded, has somewhat calmed the

storm by saying, "I would not take an arbitrary stand against popular demand."

PRISON CONTRACTS IN RHODE ISLAND

The criminal code and philanthropy, infant mortality, the church in social service—each of these themes was up for discussion at the Rhode Island State Conference of Charities and Correction, held in Newport last month. Judge William H. de Lacey of Washington dealt with the system in the District of Columbia whereby deserting husbands are compelled to care for their families through the authority of the Juvenile Court. The juvenile court, he said, is really a family tribunal rather than a juvenile court. The Rev. Thomas B. Slicer opened a series of addresses which dealt with the contract labor system now in vogue in Rhode Island. E. Stagg Whitin, secretary of the National Committee on Prison Labor, declared that the dark cell, the straight-jacket, and the gag are being used to bring about discipline and to compel prisoners to work. John J. Sonstebly, of the United Garment Workers of America, set forth the present attitude of organized labor to the contract system, as follows:

We do not believe in nor advocate keeping prisoners in idleness, but the alternative to idleness should not be unfair competition with free labor in the open market. Organized labor believes that the employment of convict labor should be so diversified that the burdens will be equally distributed among all free labor and reduced to such a minimum that the members of no trade or occupation can justly complain.

Mr. Sonstebly especially arraigned those contracts which provide that the product shall not be sold within the state where it is made.

That there are four types of diarrheal diseases which are now recognized, and that each type requires distinct treatment, was the theme of a paper interpreting present advances in their prevention and treatment, by Dr. Charles Hunter Dunn.

"We have learned from bitter experience," said Dr. Dunn by way of illustration, "that paregoric is frequently a very dangerous drug in the acute diarrheas. On the other hand it

is very valuable, almost specific, in the type due only to increased peristalsis. We have learned to treat each type by itself."

Dr. Helen C. Putnam brought out that Rhode Island and Pennsylvania are the two states having the highest infant death rates, while Walter E. Kruesi, in a paper outlining a program for the practical conservation of infant life and health, called attention to the gap that now exists between babyhood-supervision and school-supervision, where we are fortunate enough to have even these.

In dealing with The Church in Social Service, Rattibone Gardner of Providence took the position that the church should not

act as an agent of the state in any of its functions, even to the extent of receiving state aid for any benevolent work which it is conducting and even though it thereby relieves the state of a part of its burden. Funds raised by taxes should be dispersed as the state itself determines, and the recipients of public charity should be determined by the state and by no other organization whatever. No church should be in any way accountable to the state for its actions. This applies, in my opinion, likewise and for the same reason to voluntary charity organizations. Again, few churches are in my opinion locally possessed of sufficient resources, either in men and women or in money, to conduct in the most effective way important private charities. . . . Churches would accomplish much more by joining forces, and the work in common tends to bring them together.

The plea that "in this great work of social service we must all unite, both Jew and Gentile," was the theme of several of the speakers who called upon the church for a more active part in the conflict with oppression of every phase—industrial abuse, political influence, and personal greed.

GOVERNOR MARSHALL ON COUNTY JAILS

"Probably the most notable thing about the state conferences which have been held in Indiana for the past twenty years, and especially for the past five or six years," writes a veteran attendant, "is the excellent cooperation which they have exhibited between the executive officers and board members of

the state institutions and the officers and members of private charities. The twentieth conference, held in Indianapolis, October 28-31, was complete in its representation of the local public institutions, of which there are six in the city or within a short trolley ride. County and township institutions and agencies were also well represented."

The conference gave opportunity to Gov. Thomas R. Marshall, whose name has been mentioned in connection with the presidency, to outline his program of reform for the next two years. Favoring many things desired by the social workers of the state, the governor drew especial response when he came out for a state correction farm and the abolition of the present use of the county jails. A note sounded by Prof. U. S. Weatherly, of Indiana University, in his presidential address, and heard throughout the sessions, was that the principles of organization and centralization in social work must be developed still further than they have yet been carried.

"If we are to have progress we must organize for progress," declared one speaker.

The same topic which has come insistently to the front at more than a few state gatherings this year claimed the attention of the Indiana workers at the session of the committee on Neighborly Helpfulness, of which Alexander Johnson, general secretary of the National Conference of Charities and Correction, was chairman. The need of special education for country life was urged by Prof. G. I. Christie, superintendent of the Department of Agricultural Extension, Purdue University. Jane Addams pointed with clearness to the interdependency which must be maintained between remedial and constructive efforts if they are to issue effectively. A feature of the conference was the popularity among outside delegates and citizens of Indianapolis of a series of twenty-four round table discussions occupying two mornings. With each discussion lasting an hour and four discussions going on simultaneously it is not surprising that the topics boxed the compass of social reform.

CHILD WELFARE EXHIBIT AT PANAMA PACIFIC FAIR

Wide as was the range of subjects treated at the Sixth California State Conference of Charities and Correction (San Francisco, October 25-29), child welfare was the theme most prominently to the fore; and a resolution was adopted recommending that a Child Welfare Exhibit be arranged for the Panama Pacific Exposition in 1915.

The California meeting brought together a number of social workers "on tour," as well as strong local speakers. Among them were Francis H. McLean, secretary of the National Association of Societies for Organizing Charity, New York; Prof. John Graham Brooks of Harvard University; E. P. DeGroot, supervisor of Playgrounds, Chicago; L. H. Weir, Pacific Coast secretary of the Playground and Recreation Association of America; and Dr. W. H. Slingerland, special agent of the Child Helping Department of the Russell Sage Foundation.

General social and economic conditions, the lack of home training, the breaking down of the home, the rush for cheap amusements, were among the causes set forth for the downfall of boys and girls. One speaker declared that 51 per cent of the boys in state reform schools were from homes broken up by divorce. The extent to which physical defects are contributing causes to juvenile delinquency was recited. It was asserted that 60 per cent of the children going through the Juvenile Courts have bad teeth, adenoids, and enlarged tonsils, and that nearly 25 per cent of delinquent children and nearly 20 per cent of dependent children are suffering as the result of sexual disease. "The judge of the Juvenile Court," said one speaker, "should have in one hand the physical history of the child and in the other its moral history."

Children need the association and companionship of their parents, urged another.

The unity of the home must be preserved if we are to save the boys and girls of the nation. . . . Let there be created public sentiment so active and dominant that the parent who does not live up to his responsibility will

feel the heavy hand of an ostracism so great that life will be rendered unbearable.

The amusements of to-day were declared to be passive instead of active; the old pleasures and recreations of home life giving way, with the coming of the apartment house and the disappearance of back yards, to moving-picture shows and cheap dance halls. The establishment of the modern playground was urged as one of the best substitutes a community can provide.

Resolutions called for an appropriation for the establishment of a training school for delinquent girls, and for the devotion of the entire time of a Superior Court judge to the business of the Juvenile Courts in San Francisco, Los Angeles, and Alameda counties. Exhibits of model playgrounds, recreation maps, exhibits of school work and manual training, models of tenement house conditions, domestic science, causes and treatment of tuberculosis, and photographs, illustrations, and literature concerning the various institutions of the state were on display throughout the conference.

OPEN-AIR SCHOOL RAISES ATTENDANCE

The first open air public school in Cleveland has completed one month's work and the records for this brief period give some striking facts. The thirty Italian children who make up this roof garden school are all in incipient or open stages of tuberculosis, yet the records show an average gain in weight of one pound, and this in spite of the fact that inclement weather has prevailed. Previous records of these children show that they were frequently out of school on account of colds and other ailments. Not one child has had a cold since beginning his out-of-door career, and there has been a higher average of attendance than in any room of the school. Many of these children had dropped out of school entirely and most of the others were negligible quantities as far as getting on in school work was concerned. The record card that a few months ago read "inattentive," "dull," and "frequently absent" now reads "making

progress," "increased interest in work," and "regular attendance."

This little school has some of the disadvantages of the old district school in so far as it represents five grades under one teacher. However, this difficulty is partially obviated by letting some of the more advanced pupils go inside to recite with their classes. The establishment of this open-air school was accomplished with so little effort that the experience should be known in other cities. The director of the city schools is allowed to expend out of the general appropriation \$250 each year in whatever way he sees fit. This money purchased a wooden floor and canvas covering, which were installed on the roof of one of the largest school buildings, located in the heart of the Italian district. A teacher who needed the fresh air was transferred. The Tuberculosis League supplied blankets for the children to wear, and the School Dietary Department supplies hot and nourishing food in the morning and afternoon. This small effort has produced such favorable results that those who are watching it believe that the time is not far distant when every public school in Cleveland will have its roof or open-air room.

AN ENGLISHMAN'S VIEW OF THE NEW YORK STRIKE

HARRY PHILLIPS

LAST SUMMER THE DOCKERS' STRIKE BLOCKED THE INLETS OF LONDON'S FOOD SUPPLY; THE PAST FORTNIGHT A STRIKE OF THE GARBAGE COLLECTORS IN NEW YORK ALL BUT CHOKED THE OUTLETS FOR THE CITY'S WASTE. IN BOTH CONTROVERSIES THE COMFORT AND WELL-BEING OF THE WHOLE COMMUNITY, AS WELL AS LABOR ISSUES, WERE AT STAKE; BUT RADICALLY DIFFERENT METHODS WERE EMPLOYED IN BRINGING THEM TO AN END.

BY A COINCIDENCE, MR. PHILLIPS, FIRST HONORARY TRUSTEE AND PRESIDENT OF THE DOCK WORKERS' AND COAL PORTERS' TRADES UNION, HAS BEEN IN NEW YORK GATHERING AMERICAN DATA IN ADVANCE OF A LECTURE TOUR WHICH INCLUDES BOOKINGS UNDER THE WOMAN'S SUFFRAGE LEAGUE, THE LEAGUE FOR POLITICAL EDUCATION, THE PEOPLE'S INSTITUTE, ETC. AT THE REQUEST OF THE SURVEY, THIS LONDONER, WHO WAS ONE OF THE MEMBERS OF THE CONCILIATION COMMITTEE, WHICH BROUGHT ABOUT THE SETTLEMENT OF THE LONDON DOCK STRIKE, GIVES HIS IMPRESSIONS OF THE NEW YORK STRIKE.

THE FACT THAT MR. PHILLIPS, FOR TEN YEARS DEPUTY MAYOR OF EAST LONDON, WAS KEPT KICKING HIS HEELS IN THE OUTER OFFICE OF AN AMERICAN CITY HALL WHEN HE CALLED ON MAYOR GAYNOR IN BEHALF OF THE STRIKING GARBAGE MEN, MAY ADD A DASH OF PEPPER TO HIS STATEMENTS, BUT DOES NOT DISCOUNT THE STRIKING CONTRAST

HE DRAWS BETWEEN THE PLANES OF DIGNITY AND REASONABLENESS MANIFESTED IN THE NEGOTIATIONS IN LONDON AND NEW YORK.

On August 20 the morning papers in London had a very short paragraph stating that the London dockers had come out on strike. To the ordinary public that paragraph was of very little importance. You might as well have said a fire had broken out in the kitchen of a poor man's house. But to those of us who are in the heart of the labor movement of London and who knew the growing discontent that had been increasing for years in connection with the dock work of London, to us that statement meant a great deal of serious trouble. The next day another paragraph appeared stating that the coal porters and the stevedores had come out to help the dockers. Perhaps I should explain what that work means. The docker or dock-worker of London is the man who unloads all the ships that come into the London docks. The stevedore is the man who loads them. He is much more skilled and better paid. He has to arrange the cargo and the passengers' luggage so skilfully that it does not roll about when the ship meets the big Atlantic seas. The coal porter is the man who coals the ships from the barges. Well, these three divisions of men, comprising about 40,000, were out on strike for an increase of wages. On the third day they were joined by the lightermen, an important section of river labor, the men who row the barges and do the whole of the barge work of the River Thames. This practically held up the shipping of London. They were then joined by the carmen of London—what the New York men speak of as the teamsters or the expressmen, men who do all the express work and delivery of luggage and goods all over the city. These men were the worst paid of all the men. I know a large number of them personally, and many of them received less than \$5 a week, working fourteen and sixteen hours per day—no time allowed for meals, and if they were found waiting to get some food at a restaurant they would be fined. Very often the work ran far into the night all through winter as well as summer, for \$5 and \$6 per week. The dock workers received

twelve cents per hour for their work and averaged eight hours per day, which was practically a starvation wage to many of the men, because they seldom did more than four day's work per week. Broadly, the pay of the men was extremely low and the struggle to live very difficult. Their unions, of which I was honorary president, were greatly weakened by leakage on the part of the men who had become disheartened.

And then came this impulsive strike. It was in no sense caused or called for by any one labor leader. It was a sudden revolt of the men against conditions which had become intolerable. And they now presented a solid mass of workmen, controlling the whole of the transport of London, and by the fourth day London was practically a city besieged. No food came in or went out, no ship was loaded or unloaded, not a single carman delivered any goods. No porter in the meat markets nor porter in the fish market delivered or carried any meat or fish. In a word, the food supply of London was absolutely held up. London was dependent upon the stock of food in its shops and stores. The shop-keeper immediately put up his prices and began to make a big profit. There on Tower Hill and down by the docks was gathered this great army of 150,000 men, all in perfect order, no rioting, no shop looting, scarcely one man locked up, the police chatting with the men, and the men with the police. The most perfect good-humor reigned, but still London was held up. The wives and the children of the men were quite in sympathy with their husbands and fathers. They had starved for many weeks in the winter, without any hope, and they could very well starve for a fortnight in the summer with a great deal of hope. So London was getting very near towards being starved out. The public wanted to know what was the reason for it, and, as soon as it realized the moderate demands of the men, urged immediate settlement.

Some of the war-like and fire-eating men and members of Parliament urged that the soldiers should be called out, that the strike leaders should be shot. Churchill, one of the Cabinet ministers,

the home secretary, was going to call the soldiers out. John Burns, himself an old strike leader, now a member of the Cabinet, strongly advised against such a policy. Ben Tillet, the wonderful labor leader of the dockers, told the home secretary that if he put a single soldier into London the government would be unseated and wrecked. I know myself that that was absolutely possible. We could have stirred England from end to end against the Government, and upset them if they had called the soldiers out. John Burns asked; Whom are you going to shoot? Why are they to be shot? These men are perfectly orderly, they are giving no trouble, they are within their legal rights of combination—and behind the men there is the great principle of the workman's right to live a full, fair, and satisfied life. You may shoot the men but you cannot shoot the principle,—and so the strike went on for two or three more days. The Shipping Federation, representing the whole of the ship-owners of London, had been paying a man called Mr. Laws, a great strike-breaker who advised the ship-owners, who from the first were willing to arbitrate, not to do so. He said that he could break up the strike; but he was utterly powerless, and now stands a discredited man in London. It was impossible to break up the strike of 150,000 men, mostly skilled workmen. The strongest proof of the power of the men was shown when the postmaster, Sidney Buxton, sent to Ben Tillet asking him to give a permit for the mails to go through. This permission was granted. Also we saw that the hospitals were kept supplied with food and ice, and the workhouses and the little children had their free dinners as usual. The horses of the carmen were also looked after and fed each day, but as far as the business and the food supply of London went, we absolutely hung that up; also, no petrol for autos could be purchased.

The men then offered to accept arbitration. The ship owners agreed and a Conciliation Committee representing men and masters met, and the government appointed their own arbitrator and Mr. Askwith. We had daily messages

from the king, who watched the strike with the greatest of interest. So the men and the masters met. There was the most perfect good feeling, and by the end of forty-eight hours the whole strike was settled. The men won terms all along the line, and an agreement was signed that no further strike was to take place for a period of twelve months. Either side breaking this agreement is to be fined so much per day, either the men's union out of their funds, or the masters out of their funds. And so the great London strike was settled without a shop being looted, a window broken, or a man's head cracked. To my mind, it was the most wonderful illustration of industrial organization I have ever seen. People say the strike was unjustified. We reply, What other course had we to pursue? We had been asking quietly and peaceably for better conditions. So long as the men starved and suffered in silence the public never listened to them; but the moment you inconvenience this public, stop its food, or its comforts, immediately you get redress. I say that the strike under the present existing circumstances was the workmen's only method. It was not socialism in the least sense. The men did not strike for the control of the docks and transport of London; they simply struck for a fairer share in the wealth they produce, and to live under-better conditions in the existing state of society. I believe that industrial organization is the next step for the salvation of the worker. The average workman is not a socialist. Socialism is an abstract principle. The average working man is not concerned with abstract principles but with a definite bettering of his conditions as they stand. So the great strike was settled. It was peace with honor. Far better feeling was evoked and now exists between the capitalist and the workman, the ship owner and the docker, than ever existed before. It has led to a wonderful organization of the transport work of London. Not only in England, but internationally, the whole of the transport work, all the work connected with shipping, is federated and organized, so that there are now 700,000 transport workers all linked

together in Great Britain, Germany, the United States, France, and other parts of Europe. They are so organized that at forty-eight hours' notice they could practically hold up if necessary the whole of the transport work of Europe.

I left London about a month ago and came over here to your United States on a lecture tour. I have been staying in New York some few weeks, and there broke out last week the strike of your street cleaners. I was greatly interested in this strike because I have large sympathy with the men who do that class of work, whether in London or here in New York, and I immediately got in touch with your men and ascertained their wages, hours, etc. I think this work so horrible and so uncongenial that it is work that should be done by convicts as a punishment for crime rather than by honest men. I look upon your street cleaner and scavenger as the savior of the health and life of New York. He is handling night by night the filthy food that would spread disease, while you and I are sleeping in our beds; such work demands the fairest payment, and such men have a right to the kindest possible treatment. I think that we are always under a debt to the man who cleans and scavenges the streets of our great cities. I met your men and they said they had offered to arbitrate on the question if the mayor would kindly see them, and that he had refused to do so. I was tremendously surprised and astonished at the attitude of your mayor, bearing in mind how willing and desirous our prime minister and the mayor of London and the great ship owners had been to meet our dock workers and arbitrate. I could not understand the attitude of your mayor with such a small question as 2,000 street cleaners, and his refusing to see them.¹

¹They asked me to call on him personally and I wrote to him, telling him that I had the honor of having been deputy mayor of East London for some ten years, that I was a vice-president of the International Peace Forum of which William Taft, your president, is also president, and which has in its ranks some of your finest Americans, and that I would be glad if he would see me and explain to me his viewpoint in reference to his refusal to meet the men and to allow the question to be settled by arbitration. It seemed to me such an impossible attitude for anyone to take in 1911. I wrote a very courteous letter to your Lord Mayor, and he

He is utterly and absolutely out of touch with all the methods which are making for industrial peace. I say here frankly that our king in England or prime minister or any large employer of labor would have met his men and settled the question by arbitration. Your men told me that the whole of this dispute could have been settled in forty-eight hours. Your mayor, to my mind, has taken the line of a dictator in a country where I expected to find greater democracy and larger freedom that we have in our old aristocratic England. I see in your papers that the mayor has settled the strike and that he has won. I submit he has not won. He has lost. He has lost all that good feeling and finer friendship and willingness to work on the part of the men which are so essential in all good management. The fact that your men were municipal employes makes it all the worse that the mayor would not see them. I may add that the London Council has a standing rule that any of the employes representing any of their departments may always approach the chairman of any of those departments and lay their grievances before him. This applies to West Ham district, where I myself was the deputy mayor, and I believe that the same applies to the whole of Manchester and Birmingham. The postal system under the present Liberal government in England has also a standing board to which the postmen can apply to state any grievance.

Your mayor has sown a bitter feeling. He has sown the seed of a strike for 1912 which unless prevented will paralyze New York. By his attitude to the street cleaners he has driven together and fused the industrial organizations of New York as he perhaps scarcely realizes. I have been moving about amongst your men and I know,

without any exaggeration, what will happen unless better feeling can be induced.

I am no strike leader. I think the strike is an old-fashioned weapon, something to be hung up in the museum to show how we settled labor disputes long ago; but my fifteen years of honorary and unpaid work amongst the dock workers and river-side toilers of East London have taught me that there is a better method than the strike and industrial war, and that that method is the principle of co-partnership profit-sharing amongst your men, and representation of the men on the board of directors in every work and industry. Such a movement will always make for peace. This idea of co-partnership and profit-sharing with the men is not a dream. It has arrived. In England we have numbers of great organizations and industries where the men have some direct share of profit and interest in the work as well as their wages, where the men elect one or more of their representatives to sit on the governing board. It is the finest safety-valve both for master and for men. Wherever this has taken place there is never any strike nor labor dispute; the finest and the best feeling prevails. It was in reference to such work as this that I have seen existing and have been carrying on year after year in England that I called to see your mayor. I am convinced that it is not only commercially and economically sound but also altruistically right. I want to see the churches and all those organizations which are making for a finer feeling and a closer partnership with all classes in this great city take their share in formulating this public opinion towards some such principle as I have outlined. I am convinced from my close knowledge of and personal touch with the great labor organizations of London, and my contact with your labor organizations here during my short stay, that unless the employers, whether they be individual men, companies, or municipalities, recognize the right of the man who is working for them to a fairer share in the wealth he is producing, to a better and more humane treatment, and to recognition as one of the individuals working in the concern—that unless

kept me waiting for nearly four hours in a passage outside his room and I then had to go away without seeing him. He wrote me an official letter the next morning saying that he could not see me. I can assure your mayor that if he were to come to London neither the deputy mayor nor the Lord Mayor of London would keep him waiting for four hours without seeing him. It seems to me at the least to be very discourteous and impolite on the part of the mayor of a great city like New York. I have found greater courtesy in the citizens than in their mayor.

this spirit is developed and brought about—there will be the greatest industrial war which New York has seen for a long while. And with your dangerous cosmopolitan element which we do not have in London, I gravely doubt that you will have, as we had in London, 200,000 men standing good-temperedly and chaffing and chatting with the police, without riot or trouble.

EDITORIAL GRIST

THE CITY DISTRICT IN CHARITY WORK¹

MARY WILLCOX GLENN

Each speaker at the annual meeting of the New York Charity Organization Society approached its topic, the District—Its Significance in the Social Field, from the point of view of the family itself and then brought, by a co-ordinated treatment of his subject, the following facts into bold relief:

First, the fundamental importance of dividing a city into manageable parts, so that the social worker may get close to his problem and may see it with the eyes of him who belongs, not by choice, but by force of circumstance, within an area of mean opportunities. More than one of the speakers emphasized how the Charity Organization Society and other charitable agencies, as well as the churches and the settlements, are feeling the impulsion of the command, to paraphrase a great prophet, "I must sit where they sit."

Second, the need of studying the complexities of city life in relation to socially isolated groups of people, of considering what the city withholds from these groups that it offers to other citizens who are closer to centers of influence, and of recognizing what latent forces may be

¹The District—Its Significance in the Social Field, was the subject of the annual public meeting last week of the New York Charity Organization Society—a phase of its work which is being given especial emphasis at this time, and to the prosecution of which Mrs. Glenn is contributing much constructive thought and energy as chairman of a committee of the Central Council. The speakers were: Judge Julian W. Mack, of Washington, D. C.; the Rev. William J. Kerby, D.D., of Washington, D. C.; Pauline Goldmark, Frank J. Bruno, Mrs. Glenn, and Robert W. de Forest, of New York.

brought into effective play to aid them to secure a fairer share of municipal services.

Third, passing on from an intensive study of a particular locality, the value of acting so that the family which emerges from the great body of families within a district to ask for charitable assistance be secure in its right to receive individual consideration. Each claimant must be the subject of careful study, each must benefit by definite treatment following close on the heels of inquiry, each must feel the result of the establishment of genuine relationships between the various agencies at work within the field. Special emphasis was laid on the importance of conserving the fine springs of charitable emotion so that, in making the delicate adjustment between the service of the tutored and the untutored, there may be no loss of true helpfulness.

Fourth, the sharp defining of the value of the service of neighbor for neighbor. One who by birth as well as by election is the neighbor works from a point of vantage in trying to remove a fellow's handicap and in evoking or restoring his sense of true citizenship. What the St. Vincent de Paul Society is contributing in calling into play this form of district service was clearly described.

Fifth, the duty that lies upon those who have learned the richness of the opportunity for personal service to arouse to effective expression the dumb desire to serve of the many who live outside the poorer districts. Many await the definite call to take up the individual problems of those who are staggering under the burdens of life. The district forces must be prepared to make the call definite, must study how to vary the method of approach to family life, must see to it that they offer a kind of work which shall serve to discipline, to enlighten, and to unify. The readiness to be enlisted was shown to be due not only to a consciousness of the need of increasing the sum of civic righteousness, but to the underlying spiritual purpose of preparing for a citizenship which is not of this world. It was further emphasized that the call for service must be made not in behalf of an agency or of a society, but

in behalf of the common cause, and that to enlist is to recognize this service—to use William James' phrase—as “the moral equivalent of war.” The purpose of the district effort was shown to be to increase within any selected area the number of those who are socially minded.

Faith in the power of the individual to rise, faith in the service which fellow can render to fellow, faith in the contribution which forces secular and religious can make in the regeneration of even the most meanly endowed sections of our city, may be claimed to have characterized this meeting and to have made its peculiar significance. Its significance also lies in the quickening recognition of the fact that we are entering upon a period when gathered emphasis is to be laid on the need of a psychological approach to the family problem. In making the psychological approach results of social gain are to be measured ultimately by the service rendered not to the bodies but to the souls of men.

CONSTRUCTIVE RELIEF

FREDERIC ALMY

Secretary Buffalo Charity Organization Society

Relief was formerly destructive, killing character. It is now constructive, and builds character. Money can be made quite as spiritual in its effects as the alms of good advice. Constructive relief is one of the new slogans of charity. It needs, and it will get, more money and more endowments than were given even to the wealthy old relief societies.

As Jane Addams said at St. Louis in 1910, in her presidential address before the National Conference of Charities and Correction: “The negative policy of relieving distress, or even the more generous one of preventing it, is giving way to the positive idea of raising life to its highest value.” The old relief was lavish, but negative in its results. The protest of organized charity was at first extreme in its insistence that we should prevent pauperism by denying alms. Organized charity today seeks to lift life to its highest levels.

Mere relief was laxative, and dangerous to character. No relief was tonic,

but equally dangerous to character. Constructive relief considers character first. Its emphasis is spiritual though it makes use of material agencies.

Dr. Devine said ten years ago, and still says: “Our resources for relief are woefully inadequate. Our use of relief has been most sparing and timid. I am inclined to believe that we have caused more pauperism by our failure to provide for the necessities of life, for the education and training of children, and for the care and convalescence of the sick, than we have by excessive relief, even if we include indiscriminate alms.”

Neglect is the great pauperizer, not relief, but the old bogey dies hard. Adequate relief pauperizes less than inadequate. If you sprinkle plants, the roots turn upward, but watering them makes the roots strike down deep. As Mr. de Forest says: “Inadequate relief is torture and temptation.”

Modern charity is the most liberal, the most tender, and the most effective charity the world has ever known. It used to be called as easy to get blood from a stone as to get money from organized charity, but this was prejudice and misconception. The commandment of modern charity never was “Thou shalt not give,” but “Thou shalt give thyself.”

Mere relief, without more, seldom relieves, and seldom raises standards of living. It must be relief plus a plan, relief plus a friend, for the gift is indeed bare without the giver. I would rather trust poverty to the tender mercies of a friend without relief than to relief without a friend; just as I would rather trust a good doctor without drugs than drugs without a good doctor. Relief is dangerous, like the drugs which ease pain and create appetite. Since relief is dangerous it must be handled by people who are competent for danger. Fire is dangerous, but if the fires of the world do not burn the wheels will not turn. Nevertheless, children must not play with fire, and the day is near when social workers like doctors will have to pass an examination before they are allowed to practice upon the lives of the poor.

Pre-collected relief, or a large relief fund which it is easy to dip into, is

especially dangerous, and leads to lazy work in developing the natural resources of families in need. So far as possible, relief should be hand-picked for each family. I dislike even pre-collected work, and believe in individual jobs for unemployed men instead of a work-room or wood-yard.

Good charity is expensive, as Homer Folks says, and poor charity is worse than none. No competent society will employ incompetent people to help the incompetent poor. It takes ability to mend broken lives; and the wasteful crudities of unsalaried relief are like pouring water through a sieve. An unsalaried society will always lack funds for relief. Those who give doles to many have never enough for any. We want quality of relief, not quantity. "Those do not give best who give most, but those give most who give best."

How shall we get the money for adequate relief, and for the adequate salaries which must precede it if it is to be a blessing and not a curse to the poor? How shall we get the vast sums which modern charity calls for to support the widowed and tuberculous families, and to administer this relief wisely? Such relief is very costly, and it is an important question whether the money can be found for it by private charity.

I believe myself that a society which has not the energy to find adequate relief will not have the wisdom to use it; but timidity in emphasizing relief has caused inadequate relief in many cities. I think that adequate relief is a neglected asset for obtaining the money necessary for adequate treatment. Much inadequate relief comes because the money is not in sight, and the money is not in sight because of inadequate relief. Why not warm the cockles of the public heart, which finds us cold? The question is, can we get the money that goes to a relief society for the work of a charity organization society? I think we can, but most charity organization societies have been content with the support that goes to a society for organizing charity. They have wanted to give relief, but they have "let I dare not wait upon I would, like the poor cat in the adage."

THE TREND OF THINGS

With the organization last June of the *Civic Press*, the *American City* has changed hands and the fall numbers are showing the new lines of emphasis which may be expected under the present management. The editor is Harold S. Buttenheim, who has been for more than fifteen years identified with trade journalism, resigning the position of second vice-president of the David Williams Company, publishers of the *Iron Age*. As a commuter in Madison, New Jersey, Mr. Buttenheim organized a local civic association four years ago and has been in touch with various lines of municipal affairs. Edgar J. Buttenheim, his brother, formerly circulation manager of the Williams publications, is the business head of the new venture. The field which the new management have set out to occupy is midway between that of civic reform pamphleteering and the more technical municipal trade journals such as the *Municipal Journal* and *Municipal Engineering*. The November issue contains Gov. Woodrow Wilson's address at the Social Center Conference in Wisconsin, an article on the new commission government charter of Spokane, and a third on street lighting, to illustrate three phases of the field before the *American City*.

* * *

True to the promise made last February when the *Yale Review* suspended publication on the ground that its field was the same as that which was to be covered by the *American Economic Review*, established at that time by the American Economic Association, the older review has reappeared this fall in a new aspect. The *Yale Review* (new series) starts in October as a quarterly devoted to literature, science, history, and public affairs. Among the articles in the first issue are Infantile Paralysis, by Simon Flexner, A Living Rate for the Railroads, by Morrell W. Gaines, and War, by the late William Graham Sumner.

* * *

The Class-consciousness of the Eleventh Edition of the *Encyclopedia Britannica*—this is the novel contribution to social criticism promised as a feature of the *Twentieth Century Magazine* under its new editorship, that of Charles R. Zeublin. It will be written by Professor Zeublin, Martin Schutze, and L. T. Johnson. The *Twentieth Century Magazine* has other important announcements to make, for with its November issue it changes its cover and its editor. B. O. Flower retires to pursue independent literary work, though he remains on the board of management and becomes a contributor. The new editor is widely known as lecturer and writer on social and economic subjects. The November issue contains among others articles by William Butler Yeats, Florence Kelley, B. O. Flower, and Charles Edward Russell. Many of the departments of the magazine do not appear this month. "Towards Democracy" contains "news editorials" on matters of social interest.

SOCIAL FORCES

BY THE EDITOR

GOOD WILL AMONG MEN: PEACE AMONG NATIONS:

The danger of war has outlived intense racial antagonisms and traditional national enmities and has now become a sort of background for commercial competition, a dark shadow cast before industrial conquests. France has still her old grievance, but there would have been no danger of war over Morocco if French and German business interests had not been engaged in fierce rivalry for the privilege of exploiting certain natural resources in that territory. Italy would not be before the bar of the world's good opinion, charged with atrocious barbarity by her soldiers, if she had had no motive for the conquest of Tripoli other than instinctive hostility to the Turk. England would not be seeking a tardy absolution after half a century for the crime of forcing opium on the Chinese, by giving grudging acquiescence in the limitation of the Indian importation to match the decline in the home cultivation of the poppy, if the desire for profit had not been a stronger motive for war than any natural antagonism of the white man for the yellow. There would have been little occasion for the mobilization of an American army on the Mexican frontier if there had not been American investments in Mexican mines and railways.

We do not seek to contrast the economic motive with racial and strictly political motives to its disadvantage. War and diplomacy which have for their end the advancement of trade, the opening of markets, the establishment of colonies, the securing of an outlet for surplus population, and the protection of foreign investments may be quite as glorious as war and diplomatic pressure inspired by race hatreds or by the desire to propagate particular faiths and institutions. Moreover the commercial element no doubt entered largely into the wars of ancient and mediæval times.

If, however, we are sincerely to pray for the coming of international peace, if we are to exhibit, by our works, our faith in the message of Bethlehem of which we celebrate this month the anniversary as our most sacred festival—the message that there is to be peace on earth, good will towards men—we must look to the exciting causes which threaten that peace where those causes are to be found, and we must take precautionary measures that have some genuine relation to the danger. Now commercial disputes are certainly especially adapted to the method of judicial procedure and, in the international field, to arbitration. Even in domestic trade we are not hesitating to deprive strong and unscrupulous traders of the advantages which are inherent in secrecy and monopoly. In a strictly analogous way we are ready to demand the open door and equal privileges in the markets of the world, subject only to such domestic regulations as each nation may think it expedient to make for the development of its own industries and the protection of its industrial workers.

Few of the issues which have disturbed the peace of the world in our generation should ever have arisen; and most of them, having arisen, should have gone promptly to a competent international court with real jurisdiction and

with an international police force adequate to enforce its decrees. This Christmas season is notable because it finds our own great nation calmly deliberating over the precise form of arbitration treaties which would go far to produce this result in the case of any future controversies with the three most powerful nations of Europe. It is well that we should deliberate. The senate, which is soon to become a more democratic body by the popular election of its members, does well to safeguard its constitutional prerogatives. Admiral Mahan does good service in pointing out that diplomacy, with the force which rests upon national efficiency in the background, rather than war alone is to be regarded as the real alternative to universal arbitration, and we shall long have need to rely upon diplomacy and national efficiency as an essential, perhaps an ultimate resource in determining our national destiny. But international arbitration treaties are not so much an alternative as a very natural expression of these ultimate elements in our destiny. We calmly set up international tribunals, not because we are afraid to fight, but because we are strong enough not to fight: We choose to settle disputes by arbitration rather than by the sword because we prefer the kind of justice which arbitration will give us, whether on specific issues we win our case or lose it.

When full recognition has been given to the importance of diplomacy, whether seeking national defense or seeking more aggressively a place in the sun, when the details of the relative responsibilities of president and senate have been settled, when all other issues honestly raised in the deliberation have been fully weighed, it is inconceivable that the treaties should fail. The plain people of the nation who must fight when there is war, who pay taxes when there are war burdens to be met, who suffer when industry is paralyzed, and who share in the blessings of a stable peace and prosperity, have the paramount stake in the outcome of the pending negotiations. The release of a substantial part of the huge sums now absorbed, even in this country, by the cost of the army and navy, interest on the national debt, and pensions, would materially advance the movements for good roads, for the support of elementary schools, especially to help the southern states carry the unfair and grievously heavy burden of Negro illiteracy, for the protection of the public health against interstate infections, for developing more rapidly the postal savings banks and inaugurating at once a national system of parcels post, and for carrying out the policy embodied in the children's bureau bill on which the senate has already once acted favorably. Such expenditures as these are literally investments in health, intelligence, efficiency, and prosperity, just as war pensions and war debts are wholly unproductive and wasteful expenditures which no generation has a right to entail upon posterity for any light and transient cause, and which the arbitration treaties and the spirit of international good will which they reflect tend to prevent.

If it is wise national policy and ultimate national efficiency by which we are to be guided let us favor the treaties.

THE COMMON WELFARE

THE CARNEGIE PEACE PLANS

When on December 14 next the trustees of the Carnegie Endowment for International Peace hold their first annual meeting since accepting the custody of Andrew Carnegie's gift of \$10,000,000, the Executive Committee will be able to report substantial progress not only in the further organization of the endowment, but in outlining the methods and the machinery by which the projects outlined in the proposed charter now pending in Congress, will be undertaken.¹

The endowment has divided its work into three departments of which Dr. S. N. D. North, statistician and editor for the endowment, writes as follows:

The first, to be known as the Division of International Law, will concern itself "to aid in the development of international law and a general agreement on the rules thereof and the acceptance of the same among nations; to establish a better understanding of international rights and duties, and a more perfect sense of international justice." Dr. James Brown Scott, the secretary, has been appointed director of the first division. His long training as a professor in American universities; his experience in the State Department, where he was the solicitor during the greater part of Senator Root's term as secretary; his series of treatises on

¹Headquarters have been established at No. 2 Jackson Place, Washington, directly opposite the White House and the State Department, in the building formerly occupied by the Pan-American Union. A small clerical force is at work here, under the direction of Secretary Scott, who is the administrative head of the endowment, as the direct representative of the trustees.

various phases of international law; and his services at the Second Hague Conference as the technical delegate of the United States Government all equip him for it. This division of the movement is recognized by the close students of the subject as the field in which constructive work promises to be most effective, in further developing those principles of international law upon which nations can be brought into agreement; in working out the principles of arbitration in such a way that they may be ultimately substituted for arbitration treaties between individual nations; and in establishing an international court which shall be a real and permanent court, and not merely a panel of judges out of which a temporary court may be drawn, as is the case with the present Hague Tribunal.

The second division of the endowment has been designated the Division of Economics and History, and John Bates Clark, professor of political economy at Columbia University, has been appointed director. Its work, as described in the charter, will be "to promote a thorough and scientific investigation and study of the causes of war and of

the practical methods to prevent and avoid it."

Dr. Clark has given close study to the economic causes and economic effects of war, as shown by his numerous addresses on these subject at Mohonk Conferences and elsewhere. The second division, like the first, will expend its energies in scientific research. Vast as the literature of peace has become, no such fundamental investigation of the underlying conditions precedent to and following upon the phenomenon of war, by the technical methods of the economist, has ever been made. It is a work too great and too far reaching to be undertaken as a purely private enterprise. The Carnegie endowment affords the means, for which the world has been waiting, whereby such a study, reaching out into all countries and including all modern wars, can be prosecuted

ANDREW — "NOW I WONDER
WHAT JOHN WILL DO NEXT?"

—Donahy in the Cleveland
Plain Dealer.

ON NOVEMBER 10 THE CARNEGIE FOUNDATION WAS ORGANIZED UNDER A NEW YORK CHARTER AND TO IT MR. CARNEGIE TURNED OVER \$25,000,000. FIVE OF THE INCORPORATORS ARE THE HEADS OF THE GREAT PHILANTHROPIC TRUSTS HITHERTO ESTABLISHED BY MR. CARNEGIE:

THE CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE,

THE CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING,

THE CARNEGIE INSTITUTE OF PITTSBURGH,

THE CARNEGIE INSTITUTION OF WASHINGTON,

THE CARNEGIE HERO FUND COMMISSION.

in a manner so thorough, under direction so eminent, that its results must make their impress upon governments, and tend to hasten the day when international peace will be accepted as a necessary postulate of civilization.

The third division has been designated the Division of Intercourse and Education, and pending the selection of a permanent chief, Dr. Nicholas Murray Butler, president of Columbia University, has consented to organize it as temporary director, with an office in New York city. This branch of the work of the endowment is practically a work of propaganda. For years Dr. Butler has been recognized as one of the closest students and most earnest advocates of the movement which the endowment is intended to promote, to harmonize, and to accelerate. He not only possesses the confidence of all Americans interested in this movement, but has a wide and intimate acquaintance with its leading exponents in the principal European countries. The specific purposes for which the third division has been created are defined in the proposed charter as follows:

"To cultivate friendly feelings between the inhabitants of different countries; to increase the knowledge and understanding of each other by the several nations; to promote a general acceptance of peaceable methods in the settlement of international disputes and to maintain, promote, and assist such establishments, organizations, associations, and agencies as shall be deemed necessary or useful in the accomplishment of the purpose of the endowment or any of them."

TO GET DOWN TO BED ROCK OF WAR

Professor Clark was in Europe at the time of his appointment as director of the second division, and it was fortunately possible for President Root and Secretary Scott to arrange for a conference, which took place under Dr.

Clark's supervision in Bern, Switzerland, in August last. To this conference were invited some twenty economists and publicists, representing seven European nations, Japan, and the United States. Nearly all attended, and in a series of meetings extending over ten days a program of studies was agreed to. These researches are to be entered upon under the immediate supervision of the participants in the conference, who divided up the work in accordance with their personal preferences and studies.

Two things are pointed out about this method of procedure. First, it demonstrates the international basis upon which all the work of the Carnegie endowment is planned; while the endowment itself is an American institution, in the sense that it was founded here, is administered here, and has a local *habitat*, it is nevertheless in the view of trustees and founder a world-wide institution, in the sense that it seeks the co-operation and co-laboration, on an equal basis, of the trained minds and the leading experts of every country. Second, while the members of the Bern conference were selected without reference to their personal views on disarmament, arbitration, and the whole subject of the possibility and desirability of the abolition of international war, and while they, as a matter of fact, held divergent and conflicting views on these subjects, they were nevertheless unanimous as to the form of the investigation.

CHRISTMAS SALE OF RED CROSS SEALS

If five Red Cross seals will cure one case of tuberculosis, how many cases will 50,000 seals cure? A haggard-looking woman, speaking a strong Irish brogue, walked into a west-side drug store in St. Louis the other day and asked for a bottle of Dr. Quack's Consumption Cure. While the clerk was wrapping the package, she conversed volubly of Mike, her husband, who was sick with consumption. She said one of her neighbors, Mrs. Casey, had told her that the bottle of medicine she held in her hands would surely restore Mike to health. So she had saved fifty cents from the scant earnings she won over the washtub in order that her husband might have a chance. As she turned to go away, her eye was attracted by a sign upon which was this legend in big red letters: *Buy Red Cross Christmas Seals, and Help Cure Consumption. A penny for a Seal.*

From the few cents in the palm of her hand, the woman drew out a nickel and holding it to the clerk, said, "Oi'll take five of them. Sure, with this bottle of medicine, and thim things stuck on Mike, he'll be well in a wake."

—The story is one of those brought out by the Red Cross in provoking interest in its Christmas seals. Although the actual selling season did not begin until December 1, the national agents had earlier been compelled to increase their original order of 50,000,000 seals to 75,000,000, with the prospect of a further increase later, possibly to 100,000,000. Not all of these seals will be sold, of course, but present indications are said to point to a sale of 20,000,000 in excess of that in 1910, or over 50,000,000.

Almost every known method of advertising the seals is used this year. The newspapers and magazines carry large display advertisements, all of

which have been donated to the campaign. The billboards also show generous donations of space, and all of the large street railway advertising syndicates from the Atlantic to the Pacific and from the Gulf to the Canadian border have donated free space in their cars. The motion picture theaters are again helping along this line, by displaying a new film dealing with tuberculosis, entitled "The Awakening of John Bond", and by showing colored lantern slides of the seal itself. Circulars, letters, dodgers, window cards, and even badges and buttons are used to remind the public to "Buy Red Cross Seals and Help Prevent Tuberculosis."

The sales organizations in all parts of the country have been organized with

greater care than ever before, and with the exception of a few sparsely settled localities, Red Cross seals will literally be "On Sale Everywhere." From the sales manager, using every known method to promote the sale, down to the hustling school boy striving to win a button for selling 100 seals, 500 anti-tuberculosis agencies are en-

gaged in the work; and this story, reported by one of them, shows how nearly the bright red bits of paper and the Christmas spirit they stand for have to do with the sober responsibility which this organization meets in its everyday work, and to whose treasuries these Red Cross seals bring reinforcement:

A man walked up to a Red Cross Christmas Seal booth in San Francisco, and after fumbling around till he found a dollar in his pocket asked for a hundred seals. He seemed to want to say something, and; the chance being given, he told how these greetings were to be put on some letters, cards, and little packages his wife was to send out this Christmas.

"She told me to be sure to get them," he said, "and so I came here before going to the shop, for it's the last Christmas she'll have a chance to remember those she loves. The doctor says she may hold out till after New Year's, but her cough's so bad now I don't much think she will."

Then he turned quickly and hurried away.

**THE SPIRIT OF YOUTH
AND — KANSAS CITY**

Kansas City's Child Welfare exhibit, which was held in Convention Hall, November 3-11, was similar in the main to those of New York and Chicago but had some characteristics of its own. With one or two notable exceptions, the average visitor passed through the departments of the pioneer New York exhibit

thing to be noted about the exhibit; but it was coupled with western optimism and the graphic interpretation, also, of the positive forces for child welfare in the community. The second point was that it was given under municipal auspices, those of the Board of Public Welfare,¹ which has charge of various activities for social betterment and is itself, perhaps, Kansas City's most unique-con-

Can Society afford
such a sacrifice of health?
Board of Public Welfare

The Kansas City Child Welfare Exhibit was characterized by Mrs. Florence Kelley, secretary of the National Consumers League, as the "most ruthlessly truthful exhibit in my experience." "That a municipal board," said Mrs. Kelley, "should assume, over its signature, the responsibility for these statements, is almost unheard of."

with a feeling of how much was being done for the children and how excellent it was. The managers of the Chicago undertaking put a nib to each branch of their show that enabled the public to read almost in words of one syllable not only what Chicago was doing for children, but what needed to be done: how the city sized up with other cities and with the future. The Kansas City exhibit, in its addresses and displays, even more engagingly "got down to tacks," and saw to it, metaphorically speaking, that every one who came along felt the prick of them—of those things which in the community life meant neglect, exploitation, and waste. That is, perhaps, the first

tribution to civic advance. The exhibit was made possible, however, by private generosity, that of William Volker, former president of the board. The fact that the city itself was back of the enterprise was not an inconsiderable factor in the impression which it made on the imagination and common purposes of the people. "The effect in arousing popular interest" writes a correspondent, "will be felt for years to come."

In the third place this exhibit did not adhere quite so strictly to the subject of child welfare as the former ex-

¹The members of this board are: C. D. Mill, Jacob Billkopf, John T. Harding, Alexander Massey, and L. S. Mohr. L. A. Halbert is general superintendent.

hibits, for some of the things included affected only more or less indirectly the well-being of children; the term "child" was interpreted as applying to any minor. In fact, the most striking part of the entire exhibit, was that which dealt with working girls. It displayed the wages in stores and factories separately and gave photographs of rooms, an actual sample of a cheap lunch in a show-case, and an

conditions in Kansas City. Kansas City is not so large but that some of the photographs were recognized and the lessons that they carried were personal and striking, although they caused no open opposition. In the recreation section was set forth the fact that over five million dollars are spent in a year for the various forms of commercial recreation, including fifty dance halls, twelve theaters,

6. REMEDIES

What are we doing for Our Young Homeless Girls?

The Girls' Hotel takes care of 70

The Girls' Club takes care of 30.

Cooperative Boarding Clubs is a great thing to do for the landlady? 40 girls working together can receive nutritious food & clean comfortable rooms with original appointments for \$50 per week if someone will furnish the initial cost of equipment. Chicago has such Clubs and one is being organized here

But Hundreds of girls cannot afford even \$30. Should girls working cities a week be mal-nourished on charity? Girls must have a Living Wage How?

Minimum Wage Law—England has adopted this country in certain underpaid industries. Massachusetts and Wisconsin are considering such a law. What are we going to do?

7. A LIVING WAGE

A Girl Must Pay

\$6.00 for room and board, etc.
\$1.50 for clothing
.50 for incidentals
\$8.00 Total expense per week

But She Must Save for Times of Sickness and Unemployment

Is \$100 too much?

\$9.00 per Week IS A LIVING WAGE IN KANSAS CITY.

One important ordinance—to provide for factory inspectors—passed the city council immediately after the exhibit, several councilmen confessing that they "couldn't oppose it any longer." The proposal of the Board of Public Welfare of a minimum wage law as a solution of the economic distress of working women was set forth in big red letters.

exhibit of shoddy clothing. Statistics were marshalled to show that more than one-half of the girls receive \$6 per week or less and that the necessities of life cannot be readily obtained by a self-supporting girl for less than \$8 per week. \$9 was set down as a living wage for Kansas City to stand for.

WHAT FUN COSTS A CITY WHEN IT'S JUST FOR SALE

This was one of several exhibits which set forth the results of various social investigations which have been carried on during the past year by the Board of Public Welfare. In the homes section were six screens portraying bad housing

seventy motion-picture shows, 200 pool halls, and one river excursion boat. The relative importance of these forms of recreation may be appreciated when it is known that the amount spent upon them is not only a great deal larger than the cost of parks and playgrounds, but is larger than the entire amount spent for the current expenses of the Board of Police Commissioners, the Health Board, the Board of Public Welfare, and all other city departments exclusive of the Board of Education, and is two and one-half times the amount spent for the city's entire public school system. It was estimated that 25 per cent of these commercial recreations are bad, and a suggestion

printed in large letters was: "Eliminate the bad by supervision." Then a striking diagram showed what proportion of these recreations are now under careful supervision. Only the dancehalls are supervised. After the diagram came the statement: "All commercial recreation should be supervised by the city." This fact bore on an ordinance, pending in the city council, placing the censorship of motion picture films under the Board of Public Welfare.

Marked interest was attracted, also, by the sections on child labor, trade schools, industrial accidents, and factory inspection. The Playgrounds Association put on a splendid pageant, portraying the history of the town, in which children acted the parts of Indians, scouts, fur traders, missionaries, business organizers, etc. The public school children from the sixth, seventh, and eighth grades of the entire city, arranged by districts, gave the afternoon entertainments—drills, choruses made up of a thousand children's voices, and athletic dances which were fascinating to vast audiences. The Park Board had a model playground set up in the lobby and furnished three play festivals in which a folk dance by the Italian young people was the most striking feature.

SANITARY SURVEY OF ALABAMA MINING CAMPS

The Alabama Coal Operators' Association during the last two years has, through its organization and through the individual efforts of its members, given considerable attention to the subject of accident prevention both on the surface and underground. This work has been supplemented by the organization and training of a number of first aid corps.

At the annual meeting of the association last August the subject of tuberculosis was given special consideration, particularly those features relating to its prevention and cure in its early stages. In expanding this general policy the association has just engaged Morris Knowles, consulting engineer, of Pittsburgh, who is now actively at work in making a social and sanitary survey of the coal mining camps represented in the organization. The work as outlined is comprehensive, embracing housing conditions, the more strictly fundamental sanitary features, including drinking water supply, closets, sewage and garbage disposal, etc.

The problems of education and recreation will also be given consideration. In announcing the plan the Coal Operators' Association states:

As a result of concerted effort along these lines, it is hoped that living conditions throughout the state will be such as to entitle Alabama to first rank in matters of this character.

This is perhaps the first instance in which the operators of any important district have undertaken such a concerted and scientific study of

camp life. Mr. Knowles was the municipal engineer who was in charge of the building of the great Pittsburgh filtration plant, is chairman of the Commission on Sanitation of the Pittsburgh Civic Commission, and is otherwise equipped for this notable undertaking among the southern mines. He contributed an article on Sanitation in the South to the *Manufacturers' Record* last year, and has more recently prepared a report on the sanitary needs of the Birmingham district for the January number of *THE SURVEY*. Maurice R. Scharff will be his resident assistant.

EDITORIAL GRIST

A MATCH WORKER

JOHN B. ANDREWS

John Werner came to America from Germany and from August 1907 until December 1908 he worked in an Ohio match factory. In Germany, as in practically all civilized countries except the United States, the government does not permit the use of poisonous phosphorus in the manufacture of matches. It has long been known that where this deadly poison is used a terrible disease called "phossy jaw" afflicts the workers. The government of the United States and of the several states, however, still permits the use of the poison, for which there are harmless substitutes. The poison is a little cheaper.

But John Werner came to the United States for citizenship. After working one year and four months in an American match factory he contracted "phossy jaw." His teeth dropped out; his jaw bones decayed. He suffered excruciating agony. In spite of two surgical operations in April, 1909, he is condemned to a miserable existence on liquid foods. Still able to drag himself about, he is not strong enough to work.

John's wife took in washing until crippled with rheumatism. Then, with the help of relatives in the old country, she and their one little girl returned to

Germany. John Werner, helpless and alone, then sued the match corporation, under the employers' liability law, for damages. The corporation through its attorneys denied "that it was guilty of carelessness, negligence, or improper conduct." John Werner did not get one penny.

Now, with his face in a bandage tied in a knot at the crown of his head, he drags himself up and down the streets of this match factory town, bearing the following petition:

I, JOHN WERNER, A NATIVE OF GERMANY, WHO CAME TO THIS COUNTRY FOR CITIZENSHIP, LABORING IN ONE OF ASHLAND'S MANUFACTURING ESTABLISHMENTS, CONTRACTED A DISEASE OF THE BONES OF THE FACE. I AM UNABLE TO WORK. HAVE NO MEANS. BY AID OF KINDRED IN THE FATHERLAND, WIFE AND CHILD HAVE GONE TO THE OLD COUNTRY, AND I ASK AID FROM THE PEOPLE OF ASHLAND TO GET MYSELF INTO PHYSICAL CONDITION TO MAKE THE TRIP AND EXPENSE OF THE TRIP TO JOIN THEM IN THE FATHERLAND.

During the past six months, while living alone in a shed near the railroad track, he has collected with this appeal nearly twenty dollars. The characteristic odor of this occupational disease forces everyone to shun him. He can eat no solid food. Physicians frankly state that his case is "hopeless."

The story of John Werner is merely typical. In spite of the most extraordinary sanitary precautions, match workers in our country still suffer and die with this loathsome disease, and there are many others to whom early death would have been welcome. Absolute prohibition of the poison is the only remedy.

"Phossy jaw" is an unnecessary disease! Congress by passing the Esch bill can stop the use of the deadly phosphorus. The Association for Labor Legislation appeals to all to urge its passage upon their representatives in Congress.

HORATIO ALGER, THEN AND NOW

WHEREIN IS SET FORTH THE STORY OF RIP VAN WINKLE IN TERMS OF TONY THE NEWSBOY

LEWIS E. PALMER

"Tony the Newsboy" was his name and Horatio A. Alger was his father. Last Saturday we figuratively coaxed Tony from between his frayed covers in

JOHN WERNER.

A typical case of phosphorus poisoning.
Photographed November, 1911.

a Sunday school library (of course he was sleeping in an ash barrel) and took him to the Boston School Committee. He was so pitifully forlorn, all shreds and grime and ashes, that we let him sit on the floor behind a blackboard where he could see but not be embarrassed. For though Tony is still a favorite when he stays where he belongs, in his book, we felt that he might not prove very popular among the fifty up-to-date news-merchants in the room. Picture him crouched down in the chalk dust behind the blackboard, watching and listening with mouth and eyes and patches agape.

Judge Harry Hornstein, "aged sixteen, sir," of the Boston Newsboys' Trial Court, was speaking: "I am not here to do any electioneering today, fellows. I have been serving on the Trial Court for a year now and my term of office is over. It's up to you fellows representing over fifty schools here in Boston to elect a new board today and we all want to see the best boys win out, no matter what their color or religion or school is. The court during the past year had tried to give every fellow a square deal, and although some of us don't know very much about jurisprudence we've been on the job for justice to all and I think you fellows will agree with me. It's poor business to sell before six o'clock in the morning, because a fellow that sells before that time don't get enough sleep at night and is dopey the next day in school. If you want to grow up to be a bum, the best way to start in is to sell late at night to the sports who ought to be home in bed. If you're on the job with your badge during the hours when you ought to be on the job, you won't run up against this court or any other court."

We thought we saw Tony slink back a little farther into the corner when Philip Davis, the supervisor of licensed minors, introduced the five candidates for the three positions in the Trial Court. A little Irish chap from South Boston, an aspirant for the bench, explained that he could make up in ability what he lacked in size. A colored boy from Dorchester modestly set forth his claims. A German from English High and a Jew from the High School of Commerce told just why they should be elected judges.

Then the balloting started. There was a rumor that the slate had been "fixed," but in reality the votes were split from the head of the ticket down. In Tony's day there weren't such things as news-boy republics, and so Tony was more aghast than ever when he saw that the balloting included a captain general and a general secretary as well as the three judges for the Trial Court. Each captain of newsboys from the fifty schools had a vote for each candidate, some of the delegations carrying over 200 votes from their respective districts and some swinging not more than twenty. The final count showed that the Trial Court for 1911-12 will consist of Michael Berman, Ab Resnick, and Henry Brown, a colored boy. The captain general will be James Biederman, and the general secretary Joseph Flax.

When the cheering was over we thought of Tony in his patched trousers and ragged shirt. But Tony had gone back to his ash barrel in the Alger book. Newsboy republics and newsboy courts had made him homesick.

The Boston Newsboys' Republic consists of all newsboys between the ages of eleven and fourteen licensed by the School Committee, as distinguished from the older boys licensed by the City Council. The republic has some citizens over fourteen who attend school and agree not to smoke, gamble, short change, or do anything whatever unbecoming a young citizen. It has been in existence for about four years and is a self-governing scheme applied to the needs of the trade. It is made up of 3,000 licensed newsboys, 100 additional captains and lieutenants elected annually by the boys according to school districts, a chief captain, a general secretary, and seven district captains.

The Newsboys' Trial Court, established about a year ago, is the republic's department of justice. The court consists of three newsboy judges elected from the ranks of the captains, a clerk, and two adult judges appointed by the School Committee. The court deals with all violations of license regulations and minor troubles which before had clogged the Juvenile Court. A year's trial has proved the newsboy's court a success.

RELIGION IN SOCIAL ACTION

I

LIFE AND RELIGION

GRAHAM TAYLOR

[THE SERIES OF ARTICLES ON RELIGION IN SOCIAL ACTION WHICH PROFESSOR TAYLOR BEGINS IN THIS NUMBER WAS SUGGESTED BY THOSE WHO THROUGH THE MEN AND RELIGION FORWARD MOVEMENT HOPE TO RECRUIT THE MEN IN ALL RELIGIOUS ORGANIZATIONS FOR PRACTICAL SOCIAL SERVICE IN THEIR RESPECTIVE COMMUNITIES.

THE BROADER PURPOSE OF THE SERIES, HOWEVER, IS TO INSPIRE AND INFORM LOCAL GROUPS OF PUBLIC-SPIRITED PEOPLE IN SERVING THEIR RESPECTIVE LOCALITIES IN THE MOST PRACTICAL WAYS.

BEGINNING WITH A SURVEY OF THE COMMON GROUND ON WHICH ALL MAY MEET TO CO-OPERATE, UNDER THE SANCTION OF BOTH RELIGIOUS AND PATRIOTIC MOTIVES, PROFESSOR TAYLOR WILL PROCEED TO EMPHASIZE THE INDIVIDUAL LIFE AS A SOCIAL PRODUCT, BOTH AS A FIELD FOR SOCIAL CULTIVATION AND AS A FORCE TO BE USED FOR COMMUNITY WELFARE. HE WILL THEN CONSIDER THE RELATIONSHIPS WHICH CONSTITUTE BOTH LIFE AND RELIGION, IN ARTICLES DEVOTED SUCCESSIVELY TO THE FAMILY, NEIGHBORSHIP, INDUSTRIAL CONDITIONS AND RELATIONS, POLITICAL FUNCTIONS, AND THE AGENCIES OF LOCAL GOVERNMENT.

UNDER THIS LAST HEAD HE WILL SUGGEST LINES OF CO-OPERATION BETWEEN PRIVATE CITIZENS AND PUBLIC OFFICIALS, CIVIC AUTHORITIES AND VOLUNTARY AGENCIES, AND WILL GO INTO SUCH DETAILS AS THE CO-OPERATION OF LOCAL GROUPS WITH COUNTY COMMISSIONERS, CITY COUNCILS, THE HEADS OF MUNICIPAL DEPARTMENTS, SUPERINTENDENTS AND MANAGERS OF PUBLIC INSTITUTIONS, AND THE CO-OPERATION OF VOLUNTARY ORGANIZATIONS WITH EACH OTHER AND WITH THE CHURCH.

THE SERIES WILL CONCLUDE WITH AS CONCRETE DEMONSTRATION AS POSSIBLE OF THE PRACTICABILITY OF CO-OPERATIVE UNITY FOR ALL THE FORCES MAKING FOR RIGHTEOUSNESS, PUBLIC WELFARE, AND PROGRESS IN EVERY AMERICAN LOCAL COMMUNITY. THE INSTALMENTS WILL NOT LACK FOR GRAPHIC HUMAN INTEREST WINNOWN BY PROFESSOR TAYLOR'S BROAD FRATERNALISM, AND DRAWN FROM HIS EXPERIENCES AS MINISTER, SETTLEMENT WORKER, AND CITIZEN.—
THE EDITORS.]

LIFE IS RELATIONSHIP

Life and religion are alike. They were meant and made to be one and the same. A human life consists in largest part of its relations with other lives. There is no "self-made man." If any of us could be put in a chemist's retort, and by some strange alchemy everything were extracted from him that mother and father, brother and sister, playmate and schoolmate, teacher and work-fellow, wife and child, pastor and partner, author and speaker, the world's literature and the life of his own day and generation have put into him, who would dare to look at himself in the glass? Could any one recognize himself? Every one of us would be nothing less than a blasphemy of his former self. For each and all the capacities and powers which constitute selfhood and come closest to being himself, the individual is dependent upon and indebted to others. Every human life is a social product, produced by the co-operation of many other lives. Every one of us who is

honest must put down on the credit side of life's ledger all others who have invested any part of their lives in him, and, with Paul, write himself down, "I am debtor."

RELIGION IS RELATIONSHIP

Religion, like life, is relationship. No other word is so interchangeable with it. It is the ideal of what the relation of the one man should be to the one God and to every other man.

The religion both of Judaism and Christianity consists of their founders' ideal of the relation of man to God as Father and man to man as brother which is being progressively experienced by the individual and gradually fulfilled in the life of the community and the history of the race.

THE BIBLE A BOOK OF LIVES

The Bible is the story of the way in which these relationships were realized. Godward and manward, in the personal experiences of typical individuals and in

the history of selected family, national, and racial groups. It is the book of lives and therefore the Book of Life. It gives life through lives. It is biography and history, the life story of God and man. The book of Genesis is Abraham's life put to press between the times of Ur of the Chaldees and the eternity of the Lord God Almighty, whose friend he was, with whom he walked and talked. In Exodus we see the patriarchal households becoming the People of Israel, the "kingdom of priests," as Moses' life emerges from the age of the Pharaohs into Jehovah's leadership. In great succession the books of the Old Testament and the New bear the sign manual, if not the names, of the men and women through whose lives they were produced. They have the earth flavors of every land from which they sprung at the touch of life from God's skies upon the soil of man's earth.

LIVES ARE ITS LETTERS

Leaves of life—God's life in man—constitute the sacred literature. Human lives are the letters, the characters, the very types in which the Word is written. Men, women, and children; families and tribes; neighborhoods and fellowships; nations, peoples, and races live, move, and have their being in this Book of books, *par excellence* the Book of Life. In form and substance the Scriptures of both Testaments are biography and genealogy, history and experience, folk lore and personal epistles, songs and sighs of the soul and of peoples. These are the warp and woof of which the spirit weaves the pattern of the religious life upon the inspired word. David and the psalmists of Israel, and the singers of the Advent, wrought into music the divine psychology of the human soul. And in their songs they rise to the heights of man's aspiration and sink to the depths of his sin and despair. The seers are the interpreters of God to the people and of the people to themselves. Their prophecy is the interpretation of history. Their history is the spirit of prophecy. Their religion was statesmanship. And their statesmanship was

so true to their own times that it applies to all times.

The Gospels are memoirs of evangelists, memoranda of what they saw and heard of Jesus, and of what they told others about him. The first and greatest theologian of the Church was its first and greatest missionary. It was in the heat and by the power of his passion to win men's souls that Paul wrought the facts of his own experience with God and men into the formulated truth of the epistles, for the teaching of those whom he had evangelized. Thus faith is identified with life throughout the Scriptures. But none of its seers or singers emphasizes this fact more than St. John, whose name seals the document with which the volume of the sacred book is closed. He never reduces truth to an abstract faith. Faith to him is always believing, always the verb of action, always the doing of the truth. He declares "the life, the eternal life, . . . which we have beheld, and our hands handled." And the final glimpse which this last survivor of the apostles caught of Christianity triumphant was not in another world, but in this one; not of a Church, but of a "Holy City;" not of a mere multitude of saved souls, but of the "nations of them which are saved," organized into a saved human society, in which "the tabernacle of God is with men and he will dwell with them and they shall be his people and God himself shall be with them and be their God."

RELIGIOUS LIFE THE COMMON DENOMINATOR

Far more than belief, the religious life inspired by the old Testament and the New has been always and everywhere the same. The lives growing out of the doctrine, more than the forms of the doctrine out of which they grow, stand the historic test of catholicity, "*semper ubique*." Beliefs change, vary, shift their emphasis. But the godly life, like God himself, remains the same. It is the Messianic life that links the Old Testament to the New. It is Christian living which identifies contemporary experience with primitive Christianity. The common denominator of all the sects is the real

religious life being lived by their members.

TRUTH COMING TO THE BIRTH

Dr. Austin Phelps, the great professor at Andover Seminary, thus accounts for the Bible: "Divine communications to the world have always been made through the medium of real life. Living men live a great truth, and so truth comes to the birth. The Bible is almost wholly history and biography. Abstract knowledge is given in it only as interwoven with the wants and experiences of once living generations. God took out of the circle of universal history a single segment, and the result is a revelation. Men live under special divine superintendence and illumination, and the product is—a Bible. So all the great truths which have moved the world have been lived. They have been struck out by collision of thought with the living necessities of the world."

THE FIELD AN INSPIRATION TO THE WORK

The whole great field for human service and religious work is a primary source of information and inspiration. If the Scriptures contain the spring whence the head-waters flow, the field marks the channel through which the river of life streams forth into all the world. If the divine Word contains the incentive and marching orders for the work, the work with the Word is its contemporaneous expositor. We "know the doctrine" only as we "do the truth." When the believer or the church has had no use for the faith, it has been of no use to either—"without works dead." The marching orders of the Church are like the sealed orders to the navy which are to be opened, read, and obeyed when at sea.

BASIS IN NATURE FOR FAITH

Nature is foundation for the supernatural. The natural instincts of men are the ground-work for the superstructure of faith. From self-consciousness we rise to God-consciousness. And the consciousness of God rounds out and perfects our true self-consciousness, in relation to the selfhood of God and fellow-men. The instinct of reverence is the basis upon which are built the spirit and forms of worship.

From the innate sense of accountability are developed the conviction of sin and repentance toward God. Faith is founded upon the universal experience of dependence, from infancy to old age, from birth to death. The yearning for fellowship, in the loneliness of the human soul, leads up directly to communion with the Father of our spirits and to the "Communion of saints." Even those who think, as Kingdon Clifford thought, that "science has taken God to the confines of the universe and bidden him a respectful adieu," seldom fail to feel his "sense of utter loneliness at the loss of one's cradle faith," in the thought that "the Great Companion is dead." Black old "Sojourner Truth" reinspired the faith and courage of Frederick Douglas in the struggle for the freedom of the slave by rising in the audience after he had struck a note of despair and asking, "Frederick, is God dead?"

FAITH VERIFIED BY FITTING LIFE

Thus all human experience verifies the fact to which St. Augustine gave currency in the coin current of the realm, "Thou has made us for thyself, and our souls are ever restless until they rest in thee." So we must look in human nature for the counterpart of the divine ideal of man. For something of that ideal is written on the hearts of men as truly as upon the sacred page. In seeing that the world's great heart, and every human life that shares the pulsations of the race, are as truly made for essential religion as religion is made to fit and form the life of every human being, we discover the most convincing evidence of religious faith. In claiming that being religious is nothing less, and yet can be nothing more, than making the most of ourselves and doing the best by others, and so becoming what we were meant and made to be, by the best help from Father God and brother men, we are laying the most natural basis for the appeal of the "like common faith."

The whole world of man's life rolls through the Scripture. Having the range of its area, one moves in a larger sphere than his own life-contacts or

any one age of earth's history will open to him. The world revealed there is larger than the earth can be to anyone at any one time or place. One meets there all kinds of men, types of character, and conditions of life with which he comes in personal contact, and many more. In its heavenward and earthward reach, the Bible-visioned life "lives eternal life in time," as Harnack says.

BIBLE CHARACTERS AS INTERPRETERS

But even this does not compensate the religious worker for the lack of personal contact with fellow men. To know men only as seen in Bible characters and conditions is no substitute for knowing our own neighbors and our own times. For the men and women of the Bible are there as types and interpreters of our contemporaries, not as substitutes for them. They cannot render us the service for which they have their being in the letter unless we let them lead us out into life. And yet the fact that so many of those who have deprived themselves or have been deprived of these life-contacts have, in spite of this fact, not because of it, been able to understand and help their fellow men so conspicuously as religious biography has shown them to have done proves the Scriptures to be a very real source for the study of human nature. Nothing else accounts for the success of these secluded lives, lived within such limited areas, and restricted to such remote knowledge of practical affairs. But far more effective would these merely Bible-taught men and women have been if they had known more of the world, and had been able with dear old John Bunyan to say, in the words of his prologue to the *Pilgrim's Progress*:

O then come hither
And lay thy head, thy heart, my book
together.

Through all their history and biography the Scriptures guide us to the very originators and founders of the ministries committed to ourselves. We stand at the birthplace and hour of their life and power, within the laboratory of their inmost souls—where their experience crystallized into their magnificent

conceptions, by the forge and anvil of their trials and toils where were wrought the tools and implements of their achievements. Now watch for the coming of the impulse they receive. To many of them its coming is described by the phrase which forms the preface to most of their deeds and to some of their lives, "And the word of the Lord came." This impulse to work "came" to prompt Abraham's emigrant-faith and pilgrimage to the fatherland (Gen. xii. 1; xv. 1, 4); Joshua's self-conquest for the conquering of Canaan (Josh. i. 1, 7-9); Samuel's childlike soul to be the father of the prophets (1 Sam. iii. 1-3, 21; iv. 1); Elijah's lion-heart for every turn in his mighty career (1 Kings xvii. 1-5, 9; xviii. 1, 31, 36; xix. 9; xxi. 17, 28; 2 Kings ii. 2-6); Isaiah's humble mind to "send" him to sing the oratorio of the Messiah (Isaiah vi. 8); Jeremiah's faltering faith to set him to "pluck up and to break down and to destroy and to overthrow, to build and to plant" (Jer. i. 2, 4, 10); the courage of all the heroes of faith enshrined in Hebrews, eleventh chapter, that Westminster Abbey of Scripture.

Thus also through the New Testament and church history Christian biography might be scanned to see how the Word "came" to the great world-workers. It came on the wings of mother's prayer to Augustine when, as Harriet Beecher Stowe said, this "soul-friend loved him not for what he was or had been, but for what by God's great grace he might become." It came to Francis of Assisi and made him every one's hero-saint, to Xavier and gave him the glow of heart and tongue of flame which lit up so much of the world. It "came" to the monk Martin before he became the world's Luther, and to the Wesleys, prompting their evangel of persuasive song and speech. It came to a Coleridge and thus made the Bible divine to him because it "found" him. At the knee of his motherly nurse it came to a Shaftesbury and shaped him in the philanthropic mold of Christian manhood and statesmanship which the hardship of his early school and the previous influence of political life could neither disfigure

nor destroy. Inspiration inspires or loses its claim to be inspired.

DIVINE COMMISSION AND CREDENTIAL

A commission and credential for human service is issued both by the Old Testament and the New. To each and all we meet the requirements for work. The ideal of the one is "a kingdom of priests, a holy nation" (Exodus 19:6), and the other "a royal priesthood, a holy nation, a people for God's own possession" (1 Peter 2: 9, 10). The ministering membership is the only recognized constituency of the churches of both testaments.

There must be a whole world of work if there is to be a whole kingdom of workers, a whole people of priests commissioned to do it. And there is. For the extent and diversity of the field are as great as and even greater than the number and aptitudes of the workers. Opportunities for service always exceed the trained capacities to render it. To the call of God and the demands of this world field, the church itself and the larger fellowship of human service are the response. All that men need them to be God meant his churches to be. There are as many kinds of work to be done as there are kinds of people and diversities of human nature to do them. "To each one his work." One need not choose nor refuse another's work. "Every man is a once to the spoken

word." There are few men and women whom God cares to repeat. It required the gospels of four evangelists to speak the gospel of that one great Christ-life. There are diversities of gifts and workings, but the same spirit. The ministering body "has not one member but many," and the many members of that one body are warned that "eye cannot say to the hand, I have no need of thee; nor, again, the head to the feet, I have no need of you. They, though members of the body which seem to be more feeble, are necessary." So far from permitting any fellow Christian to think that he is "not of the body," St. Paul neither allows that the working body can do without the service of every one of its members nor admits that any member can really share the life of the body if he does not do his own work for and with it. As each of the returned exiles was expected to rebuild the walls of Zion "over against his own house," so the apostolic commission is "now, ye are the body of Christ and members each in his part."

Life and religion are thus seen to be counterparts of each other, according to the account which the Bible gives us of both, and according to our own experience of each. Human lives, singly and together, and far more together than singly, are thus shown to be both the field and force for the work of religion.

THE COST OF THE CRANBERRY SAUCE

CHARLES L. CHUTE

NATIONAL CHILD LABOR COMMITTEE

In agriculture the seasonal character of the work is an ever-recurring problem. At certain times in the year, particularly during the harvesting season, there arises an urgent demand for labor—a demand hard to satisfy. This problem confronts the grower of all small fruits. In harvesting the cranberry crop in our eastern states the problem of meeting the great temporary demand for labor was

for many years an acute one, and many a cranberry crop was sacrificed to early frosts because of a lack of hands to gather the scattered harvest. In recent years, however, this problem has been solved from the standpoint of the growers by recourse to the crowded immigrant colonies in our large cities. Most of the cranberries which are in so great demand all over the country this year were picked by Italian and

A FAMILY AT WORK.
Father, mother, boy of five, and girl of three,
working together.

Portuguese men, women, and children—no small proportion by the children.

After the publication in *THE SURVEY* of the results of an investigation made last year for the National Child Labor Committee into the work and living conditions of Italian cranberry pickers in New Jersey,¹ indignant protests were made by certain prominent growers in that state. A leading newspaper took up the cudgels for the growers. New Jersey has been libeled; evils had been exaggerated; conditions were misrepresented. However, the quarrel was not so much over the facts found as over their general application and the varying interpretations put upon those facts.

Upon the return of the brief cranberry picking season this year, bringing the usual migration of great numbers of families from the cities to the bogs, a new and more thorough investigation was undertaken by the organization which began it last year. This has just been completed. Agents visited cranberry growing sections of Massachusetts and covered most

of the larger plantations in the four cranberry producing counties of New Jersey. In general, it may be said that all the essential facts of unrestricted child employment, loss of several weeks' schooling to thousands of children, an un-American system of labor under a padrone, and the crowded and unsanitary camps reported last year were this year again found to be the rule rather than the exception. Young children were found working long hours under a padrone, in Massachusetts as in New Jersey, and families were crowded into unsanitary shacks. However, as a much greater proportion of the harvesting in Massachusetts is done by means of "scoops" operated largely by Portuguese men, the evils of family migration and child and woman labor were found to be not as extensive as in New Jersey, where nearly all the picking is done by hand. This year, in the latter state, there was somewhat less crowding, slightly shorter hours, and less Sunday work, due to a smaller crop. Otherwise the situation has not improved, except in the housing conditions on one bog.

In New Jersey the picking is done almost entirely by large gangs of Italians. These gangs are largely recruited in Philadelphia by padrones employed by

CHILDREN OF THE PICKERS.
All work except the two babies.

¹See *THE SURVEY* for January 7, 1911.

the growers. These padrones take advantage of their ignorant countrymen if they can, charging them varying amounts for the privilege of a job and obtaining a "rake-off" on transportation rates. In seven cases padrones were paid a commission on each bushel of berries picked; on the other bogs they were paid wages. They are usually given the commissary privilege as well. The padrone always prefers to engage the large family with many children, for this means many pickers and of a sort more easily satisfied with the low rate of wages.

When picking begins the entire family may be seen on the bog. Babies are left to amuse themselves as best they may, while all the children who are old enough work. Upon seventeen of the bogs visited, where a careful count was made, 32 per cent of the pickers were found to be under fourteen, 18 per cent were under ten years of age, and on twelve bogs some children under five were seen working. These children are encouraged, when they are not compelled, by both the padrone and the parents to keep at work throughout the long day.

The work is in the open and undoubtedly has its healthful features; but among the conditions which make it unsuitable for young children are the prevailing wetness of the ground and the swarms of mosquitoes from which the workers suffer constantly. Many of the padrones are rough in dealing with the children. Heavy boxes must be carried to and fro and the boxes vary in size, although the price paid per measure remains the same. All these conditions are of constant recurrence.

The worst evils are in the camps, where the children live from five to seven weeks. The surroundings are often unspeakable. The congestion out-slums the city. Families of five, six, and even eight were found living in one room measuring six by eight feet, without any sanitary provisions whatever. They are not even provided with screens against the swarming mosquitoes. Barracks measuring eighteen by thirty feet were found housing sixty to seventy-five people. Refuse and filth of all kinds pervade these dwellings and are scattered about the doors and windows. Yet certain growers claim

that the children return to their city homes after a life under such conditions in better health than when they came out. Their condition when seen in the camps does not justify the claim.

Much might be done by the growers under the pressure of public opinion to improve these conditions. Four suggestions have already been made to one of their number, as follows:

- (1) That children of tender years be excluded from regular labor.
- (2) That temporary schools be established on the larger plantations which children of school age shall attend for part of each day.
- (3) That the hours of work for children under fourteen be shortened.
- (4) That reasonable supervision be given to housing conditions, so that the quarters provided shall be adequate, decent, and sanitary.

But, apart from voluntary action on the part of progressive growers, there is in the New Jersey situation a problem for the school authorities of two states which perhaps can be solved only through new legislation. Many hundreds

Contains twenty rooms, each six feet by seven and one-half feet. Over sixty persons are housed here.

of children from Philadelphia lose at least six weeks' school attendance at the beginning of the school year. Some of these lose much more through failure to return to school promptly after the picking season is over. The compulsory school laws of Pennsylvania and New Jersey should not be set aside for the benefit of the cranberry growers whose profits are already large, however willing the parents may be to profit by the labor of the children. These children need their full schooling. If they cannot be reached by Pennsylvania laws while outside that state, is not New Jersey responsible? Why should not her child labor law regulate such agricultural employments as well as other forms of work?

The evils of this annual migration could in such ways be minimized and the children to a degree protected; but should we not go further? Is not this sporadic family labor inherently bad? The employment of children in this in-

dustry, as in all others, means depressed wages and a low standard of living. The system itself is intolerable. The wholesale removal of these families is not for an outing in the Jersey pines, as one of their employers naively expresses it, but to labor for the support of the family in a region where there are no restrictions as to age or sex, hours and conditions of labor, nor regulated living conditions.

On the plantation referred to, the largest in New Jersey, housing conditions are much superior to those in the other camps. This was found to be the case last year. This year conditions have become even better, by the addition of several houses, so that the occupants of six and one-half by eight foot rooms average but a small fraction more than three persons to a room. On this bog also sanitary outdoor toilets with cement base have been erected this year. These conditions were not found on any other of the twenty-three plantations visited in New Jersey.

A COURT IN THE IMMIGRANT QUARTER WHERE ALL EUROPE IS GATHERED FRESH AND WHERE, AS RESULT OF LOW WAGES, THE BOARDING-BOSS SYSTEM RUNS OUT REAL HOMES AND FAMILY LIFE.

FIFTY miles straight north of the City of Brotherly Love and some ten miles from Nazareth is the town of Bethlehem, Pennsylvania. On the north side of the Lehigh river is the old town founded by Moravian pilgrims in 1741. Church and school and theological seminary stand there to-day, the monuments of those early missionary pioneers. Across the river is South Bethlehem, a lusty offspring that has outdistanced the parent. There Lehigh University stands, and there the smoke rolls forth from a hundred stacks of the Bethlehem Steel Corporation. On the north bank young men are studying the lives of the martyrs and the history of the Church. On the south bank they are studying metallurgy and mechanics. On the north side of the river the quiet residential streets suggest only peace; on the south side ten thousand men at furnace and lathe and forge are making the implements of warfare. On one side is the idealism of the old world; on the other the materialism of the new.

As you walk up Main street in Bethlehem from the railroad station you pass on your right the Young Ladies' Seminary, with its colonial hall, which was used as a general hospital by the continental army under George Washington. Turn the corner past the seminary and go on to the right. That brings you opposite the Central Moravian Church with its high belfry overlooking the whole town. Going on you pass the Widows' House, where the church provides a home for the women in its membership left without support; then the *Gemeinhaus* built in 1741, the first house of worship in Bethlehem; then the old Seminary, standing back from the street; and after that the Sisters' House. Turn the next corner to the left and you come to the old Moravian cemetery, on a hill in the very center of Bethlehem.

The trombone choir in the belfry of the Moravian church which ushers in the festal days with sacred music.

On three different occasions I have found myself a visitor in Bethlehem. It was on my first visit that I discovered the old cemetery, and on each subsequent visit I have returned to it. It has a fascination about it, for it represents in a wonderful manner the hopes, the faith, and the character of the pioneer settlers. You can walk through that little city of the dead and read the motives of those determined men and women who left their native soil over one hundred and seventy years ago to make a new home in the wilds of America; you can read there what America meant to them, and what sort of society they believed should be established on this new soil.

The resting-places of the dead here are not marked by replicas of the Parthenon nor by lofty granite or marble shafts nor even by broken pillars. Over each grave is a plain flat stone, not upright, but resting horizontally upon the earth.

No distinctions appear there. Old and young, rich and poor, master and servant, white men, red men, and black men are sleeping side by side, each with the same little white stone, of nearly uniform size, telling only where he was born and when he died. Side by side with "Michael of the Minnissinge Nation" lies "Johan Bernhard Mueller, born Apr. 19, 1761, in Wirtemberg, dep. June 6, 1757;" and beside the grave of "Simeon of the Delaware Nation, born 1680, dep. Oct. 17, 1756," is that of "John Lighton, born Dec. 8th, 1706, at Dondy, Scotland, dep. Aug. 23, 1756."

At nearly the extreme edge of the cemetery there is a stone, differing in no way from the others. It reads:

DAVID NITSCHMANN
FOUNDER
OF BETHLEHEM WHO FELLED THE
FIRST TREE TO BUILD THE FIRST HOUSE
BORN SEPT. 18TH, 1676
IN MORAVIA
DIED APRIL 15TH, 1758.

Next to the grave of the founder is that of

JOHN FREDERIC
CAMMERHOFF
EPISCOPUS FRATRUM
BORN JULY 28, 1721,
NEAR MAGDEBURG
DEPARTED APRIL 28,
1751
AT BETHLEHEM

And then next after these two is a stone with a long inscription upon it—the longest, I think, in the cemetery. It is this:

IN MEMORY OF
TSCHOOP, A MOHICAN INDIAN
WHO IN HOLY BAPTISM APRIL 16TH
1742 RECEIVED THE NAME OF
JOHN
ONE OF THE FIRST FRUITS OF THE

REMARKABLE INSTANCE OF THE
POWER OF DIVINE GRACE, WHEREBY HE
BECAME A DISTINGUISHED TEACHER
AMONG HIS NATION.
HE DEPARTED THIS LIFE IN FULL
ASSURANCE OF FAITH AT BETHLEHEM
AUGUST 27TH, 1746.
"THERE SHALL BE ONE FOLD AND
ONE SHEPHERD." JOHN X 16.

Just a short distance away are the graves of "Christian an African, Born and dep. 1747," and of "William, son of Johannes, an East Indian, and of Magdalen an African."

Christian humility, a human brotherhood that knew no bounds of rank or color, pure democracy—these are the principles that those pioneers brought with them to the New World; and there in that little Moravian cemetery in Bethlehem the story of their faith and works is chiseled so plainly in those simple stones that he who runs may read. It is an odd commentary that it was in the steel plant just over the river from this settlement dedicated to the worship of God and the love of man that in 1910 the workmen had to strike before they could make the public understand that they were getting no opportunity either to worship God or to know their fellow men—because they were obliged to work seven days a week, Sabbaths and all. And the local public shrugged its shoulders and said the men had better get back to work and quit making such "irresponsible, inflammatory, and untrue" statements, which were working the "great pecuniary loss of the business interests and of the invested capital of our citizens."

Yes, it is an odd commentary. But

what have the Moravians up there in the cemetery and the 1,900 Moravians now members of the Central Church in Bethlehem to do with that? And what have the thousands of other churchmen in the Bethlehems, Lutheran, Reformed, Catholic, Methodist, Presbyterian, and the rest—what have they to do with it? Not much, perhaps. And then again, perhaps, a good deal. But let me tell some more about Bethlehem before we come to that.

When the Moravian pilgrims came to America they came, like the Pilgrim Fathers of *Mayflower* fame, because they had been persecuted on their native soil. They had been driven from Moravia and had found a shelter first on the estate of Count Zinzendorf in Saxony, where they remained for nineteen years. And then, like the earlier pilgrims who were not content to remain in Holland, they came to America. Early in 1741, just a little handful of them, they built a log house, twenty by forty feet, on the north side of the Lehigh river near Monocacy creek. As soon as that was done they set to work building a larger two-story structure which they called the "*Gemeinhaus*," a substantial structure used as a dwelling to-day. This building was "for years the center of the greatest Christian activity, being at one and the same time church and administration office, home and school, inn and town hall."

There were just two things that the founders of this new settlement had to do—support themselves, and preach the gospel to the Indians. To do the former, they formed themselves into an "Economy," and for the first twenty years the settlement was a pure communism. Half of them, the "Home Church," tilled the soil, while the other half, the "Pilgrim Church," supported by those at home, went out and preached over a radius of "scores and hundreds of miles." Sometimes a man in the Pilgrim Church would come home, and one of the Home Church men would be transferred to take his place.

These Moravians were like the Quakers in some respects. They did not believe in war, and so greatly did they reverence the Deity that they would not take an oath. So, during the Revolutionary War, they did not join the pa-

Negro slaves with harsh masters they bought them and brought them home to give them back their liberty, to employ them as free servants, and finally to bury them side by side with their honored leaders.

It was not unfitting that this center of missionary enterprise and social service should have the name of the birthplace of the Christ. But the name was given it under doubly fitting auspices. For the first few months after they had built the *Gemeinhaus* the place was known simply as the "House on the Lehigh." Then in

December, 1741, Count Zinzendorf, their friend and protector in Saxony, came to visit them. The original log dwelling sheltered both the people and the cattle. It was in this house that they were sitting on Christmas eve, after having partaken of the sacrament together. Sud-

triot army; they knew little about the dispute anyway. Consequently they were looked upon as Tories, and General Charles Lee wanted to lead an army to the settlement and destroy it. But a better way out than that was found. The Moravian faith would not let its adherents fight, but it did not stand in the way of rendering aid to those wounded in battle. So the seminary was made a hospital for Washington's soldiers.

Adoration and worship of the Father may have been the first article of the Moravian creed, but the second was clearly service and fellowship with man, the brother. Hence it was that they won the confidence and friendship of the Indians, at a time when other white men were looked upon as deadly enemies. Hence it was that they so tenderly cared for the wounded patriot soldiers; and hence it was that when they found

THE "SISTERS' HOUSE"

denly Count Zinzendorf arose and led the way past the partition to the part where the cattle were stabled, and there around the mangers they sang Christmas songs. After that they could think of no name quite so fitting as Bethlehem. "And so," says a Moravian historian, "Bethlehem, city of David and David's greater Son and 'House of Bread' for this wilderness it has ever been." Perhaps it hasn't always been that, but it was once—it may be again.

It isn't necessary to tell how modern industry came into this community. It came and grew. Men of a score of different nationalities came to work in the steel mills; men of a dozen different variations of the Christian religion. The Central Moravian Church with its 1,900 members is still the largest single congregation in the Bethlehems; but the Catholic, the Lutheran, and the Reformed churches—all have outstripped the Moravian church in point of total numerical strength.

But in spite of church institutions Bethlehem is no longer a religious community. It is industrial. With the coming of industry have come conditions of which David Nitschmann, founder of Bethlehem, never dreamed. Residents of Bethlehem to-day as a whole are not spend-

ing so much thought on the Fatherhood of God and the brotherhood of man as did the pioneers, now under their little squares of stone in the old grave-yard. Some of them are, but others apparently are spending more time now talking of pecuniary interests and invested capital.

It wasn't an example of the old brotherhood when, in 1909, five men were discharged because they had signed a petition to the management of the Bethlehem Steel Corporation asking for the elimination of Sunday work. It wasn't an example of brotherhood when in 1910 another man was discharged for avoiding Sunday work, and then three more because they served on a committee that protested against this man's discharge. Neither were these examples of that democratic straightforwardness that entitled every man to the respect of his neighbor in the days of Tschoop, the Mohican, whose name became John, and of William, son of Johannes the East Indian and of Magdalen the African.

What had happened to Bethlehem that these things could be? Was it a quiet development of a policy foreign to Bethlehem's natural instincts—a policy imported, as it were, and not understood or known by the people? I cannot tell whether Bethlehem knew; but the outside world did not know. For years and years the Bethlehem Steel Corporation had gone ahead making structural shapes and rails, guns and armor plate—odd enough coincidence that the chief industry in a town named for the Prince of Peace should be the forging of the instruments of war! For years the mills had run and there had been no murmur of discontent.

Most people believe that where there are no strikes, there all is well. It is not always so. On February 4, 1910, after those many years of outward contentment, a strike began in one of the machine-shops of the Bethlehem Steel Corporation. It spread and before long the plant was closed down.

What was it all about? The government wanted to know, because it had let some large contracts to the Bethlehem Steel Corporation. So the Federal Bureau of Labor made an investigation and a report.

I am not going to reproduce that report. Get it and read it all for yourself.¹ It's worth reading. But I am going to mention some of the things that the investigators found. They found a remarkable amount of Sunday work. Out of a total of 9,291 men employed, 2,628—28 per cent of the entire working force—were working regularly seven days a week. In addition 1,413 men, who were regularly six-day workmen, had been obliged to work seven days a week in the month prior to the strike; making in all 4,041 seven-day workmen; 43.5 per cent of the entire force.

It isn't necessary to require men to work seven days a week in steel making. Most of the 1,413 men who were not regular Sunday workers but who worked on Sundays in January, 1910, were employed in the machine shops and in the steel foundry. There is no technical necessity for continuous operation in such departments. The reasons must have been commercial. But, as stated, these men were not regular seven-day workers; their regular schedule called for Saturday afternoons and Sundays free. Of the 2,628 regular Sunday workers, 542 worked at the rolling mills, 656 at the open-hearth furnaces, and 263 in the fabricating shop—1,461 in the three departments. In none of these departments is Sunday operation a technical necessity. There are dozens of plants in this country that close these departments down every Sunday. As a matter of fact the blast-furnace department, with 254 men, was the only important department that for technical reasons had to be operated Sundays. But even here the management could arrange to let every man off one day in each week, if it provided enough men to have a full crew each day. The United States Steel Corporation, the Lackawanna Steel Company, and other steel companies are proving to-day that this can be done. It is true that the twelve-hour, seven-day men at Bethlehem are not engaged in continuous unremitting toil. Theirs are waiting and watching jobs to a considerable extent.

¹Write to Commissioner Charles P. Neill of the Bureau of Labor, Washington, D. C., and ask for the report on the Bethlehem strike. Or write to the Superintendent of Documents for Senate Document No. 521 of the 61st Congress, 2nd Session.

But the continuous, unremitting demand on a man's time made by such jobs is utterly to be condemned.

The federal investigators found that twenty-one men out of the 9,184 employed were paid 60 cents or more per hour. This would be \$7.20 or more for a twelve-hour day. But 5,618 men, 61 per cent of the pay roll, got less than 18 cents an hour, or \$2.16 for a twelve-hour day, and 31.9 per cent made less than 14 cents an hour, or less than \$1.68 for a twelve-hour day.¹ Of the methods used to get work out of the men who were paid these rates, H. L. Gantt, who knows Bethlehem from personal experience there, says in his recent book: "A complete return to the drive method (at Bethlehem) has produced a series of labor troubles which have culminated in closing down the whole plant."²

Before the government set about its investigation, the citizens of Bethlehem took action. This action was not to gain the federal government's aid in learning the truth as to conditions of health and labor in the great shops where so many townspeople were employed, subject to the régime of what was now an outside corporation; nor to call on the moral support of the country in wresting back from the god of toil that Sabbath which nineteen centuries ago the Son of David said was "made for man." The train-load of business men of Bethlehem who went down to Washington went there to make Congress and the War Department and the president believe that the Bethlehem Steel Corporation was all right; that the strikers were all wrong; that the government's contracts should stand; and that the corporation should feel that its in-

²Twice has the general manager of the company told me that the report of the Bureau of Labor is unfair, and he has strongly intimated that it is untrue. But although on both occasions I diligently sought to learn in what particular the report might be unworthy of credence, and although I most earnestly requested that I be given the true facts, there has not been up to this time an iota of evidence placed before me that would discredit the report. Not only that but at no time has the manager or any other person attacked in my hearing the validity of a single statement of fact in the report. I cannot accept a general charge of unfairness from men who will not discuss particulars. Therefore I see no reason to doubt the statements made. On the contrary I am compelled, by the evident care in preparation and by the mass of figures shown, to accept the report at its face value.

³WORK, WAGES AND PROFIT, by H. S. Gantt. 1910. P. 107.

terests were safeguarded by the loyal support of the merchants and the town's best people. For there had been talk in the newspapers—as there always is—that because of the strike the Bethlehem company would move.

An organization called the Industrial Commission, composed of business and professional men of the borough of Bethlehem, held a meeting and passed some resolutions, stating that

Whereas the object of the industrial commission is to obtain, protect, and foster industries, new and old, protect the welfare of the workingman, and to encourage citizens to invest their money in homes, we denounce the assertions of the unscrupulous and non-resident agitators as irresponsible, inflammatory, and untrue, and destructive of the purposes of this commission and of the development of the town, to the great pecuniary loss of the business interests and of the invested capital of our citizens. . . .

We desire to express our appreciation to Mr. Charles M. Schwab for the great things he has already accomplished for this community, and trust he will not be diverted by the unfortunate industrial dissensions from continuing to carry out his great plans. We stand ready now as in the past to aid him in whatever way we can.

Some of the things that the strike leaders said during the conflict are of a sort for which only round condemnation is possible. But none of it was of a sort which so offended against truth and manhood as the humble, fulsome resolutions passed by these business men in the midst of a struggle for ordinary justice, carried on by thousand of workmen, their fellow towns-people. Had the workers looked to them for leadership of a higher sort, they would have looked in vain.

And what of the other leaders of the community? The fact that the strike was in the first instance, as already noted, a strike against Sunday work, and that the first men to protest had been discharged off-hand by their superiors, made it in its very essence a challenge to the churches.

There is a new federation of church organizations to-day called the Federal Council of Churches of Christ in America. It represents all of the evangelical denominations and thirty million communicants. It is an organization that gives promise of great progress in the

direction of Christian unity and action. Under this organization is a Social Service Commission which has only recently been appointed. Its business is to interest itself in social welfare and economic justice—to bridge the gap between the churches and the workers. The Bethlehem strike seemed an opportunity to demonstrate that the church can take a positive stand for righteousness and fair play in an industrial crisis. It was eminently fitting, too, that this new work, designed to bring the church back to the common needs of man, should be begun in a town called Bethlehem.

There was special provocation, also, for this action. A labor organizer had published in the labor press a number of serious charges against the Bethlehem ministers. Among other things he declared that they had not interested themselves at all in the campaign for Sunday rest, and that they were, many of them, collecting their funds through the steel company's office—a certain amount being taken from the pay envelopes of the men affiliated with the churches, and the amounts thus collected turned over to the church treasuries. It was felt that, in justice to all concerned, these charges ought to be investigated. The Social Service Commission appointed a committee, consisting of Charles Stelzle, secretary of the Presbyterian Department of Church and Labor, as chairman; Dr. Josiah Strong, of the American Institute of Social Service, and Paul U. Kellogg, to go to Bethlehem. At the committee's request I accompanied them. Against the protests of some of the local ministers, this committee visited Bethlehem and called a meeting in the old Sun Inn, where General Washington and Mrs. Washington, Paul Jones, Lafayette, and Pulaski used to stop. Thirty or forty ministers were present. They filled one of the big upper rooms, with its white woodwork and its sense of detachment from the great work shops where huge steel beams are being fabricated. Such a meeting of ministers never had been held in Bethlehem before—all but one of the entire ministerial contingent were there, it was said—nor has there been such a meeting since. Men met there who scarcely

knew one another; the Ministerial Association had never had over half that number at its regular sessions.

The labor organizer who had made the charges was asked to come to the meeting also; Mr. Stelzle, as chairman, read the charge as to the pay-roll contributions to the churches and asked the ministers if it were true. They denied it absolutely. The organizer was asked to substantiate his claim by any evidence he might have, by citing his informants, or in any other way.

He refused to give any evidence whatever. It was a very sorry spectacle he made, I thought, and I agreed with the committee's report that the charges were not substantiated. I am told that the organizer has since been dropped by the American Federation of Labor.

The meeting was one of intense interest from beginning to end. Stelzle spoke as a minister and as a workman as well. He holds a union card to-day. And he told those present that if he felt that the church was helpless in dealing with such situations as the one before them, he would not come to Bethlehem as a minister but as a labor organizer. If the church was on the firing line, he was with it. While he did not spare the labor leader who had no evidence to offer to support his libel, he fearlessly challenged the ministers about him to pledge themselves to what might be called the national citizenship of the churches—to rise above the small public opinion of those towns-people who feared for Bethlehem's undoing, and to assert the church's claim to one day out of seven—its claim for such leisure and justice among this work-a-day population which had come in upon Bethlehem as would make the life and labor of the town in keeping with its heritage, its story, and religion, in keeping with the human heritage of the whole church.

After the organizer had left, discussion broke out frankly as to whether the ministers had really, all of them, grasped the true situation in the strike. Some of the pastors of the wealthier churches thought that the charges of excessive Sunday work in the steel plant were unfounded. Their Sunday congregations had not suffered. But then up

rose men from some of the smaller congregations and those made up of workmen. One told of a deacon who had been kept from church many Sundays against his will because he was a steel worker. Another had trouble about his choir because some of his best singers had to work Sunday mornings. And when one minister said that an official of the plant had told him that the men need not work Sundays unless they wanted to, another was there to reply that a member of his congregation had told him he was afraid he would lose his job if he refused to work seven days a week.

The Federal Council's committee made a report basing its statements relative to working conditions on the findings of the Bureau of Labor, and its statements as to the church situation on the facts that were brought out in this meeting. It cleared the ministers from the libelous charge of the labor organizer, but it criticized their attitude toward strike and strikers.

It was unfortunate that only the criticism was emphasized by the papers. It was unfortunate, too, that the public got the idea that the Bethlehem ministers in some unusual and signal manner had failed to live up to the standards of the church as those standards are customarily recognized in America. For the committee never intended to make Bethlehem the scape-goat for the shortcomings of the entire church. But the committee did right to criticize, for only thus can progress come. The author of a play that reflected on the standards of the Church is reported to have answered, when rebuked for it, that no one has so good a right to criticize the church as the sons of the church. It is exactly on that ground that I, too, claim my right to criticize. I believe the Christian Church will some day be the greatest force existent for social well-being and economic justice. In that spirit I speak of the attitude taken by the ministers of the Bethlehems, and I do so even though I feel quite confident that a similar attitude would have been taken by a majority of ministers in the industrial centers of America. Often in my visits to the steel districts I have found such an atti-

tude. I must bear witness nevertheless to those self-sacrificing, public-spirited ministers whom I have met in Pittsburgh, in Buffalo, in Chicago, and elsewhere—heroic fellows, who despite opposition and prejudice and misunderstandings are doing men's work in the world. One such Protestant leader especially stands out in my mind throughout all these events in Bethlehem which I am narrating. But the church as a whole has yet to learn that saving souls consists in saving men; that the spirit can never be wholly dissociated from the flesh, so long as the body remains the temple of the soul. Possibly because of lack of knowledge of some of the real problems of life, the ministers sometimes deliver their heaviest blows against secondary evils, while the prime wrongs, the ones that dry up the roots of life, may escape their wrath. It has been true with respect to one of the biggest problems of the steel industry today—that of Sunday work. There was a movement against Sunday work in the Pittsburgh district in 1907-8; but its efforts were directed more frequently against drug-stores, confectionery and fruit stores, and amusements, than against the United States Steel Corporation, with its thousands of employes then working the long turn. There has been a radical change for the better with respect to seven-day work within the last two years, but it has not been the result of the collective protests and aggressive campaigning of the churches of Pittsburgh to enforce the Sunday closing law against the steel works that has brought it about.

Of course the hostile attitude of some of the workingmen towards the church is not entirely reasonable, although it is a feeling characteristic of the majority. They are defiant and they make demands beyond the strength of the churches. There are, on the other hand, a good many steel workers who are loyal members of churches; and the church would, I think, have the confidence of all if it would boldly withstand industrial oppression and corporate wrong-doing in the spirit of the Man who violently drove the money-changers out of the temple and who denounced to their faces those

who laid heavy burdens upon the poor.

Only one clergyman, a priest of the Roman Catholic church, openly voiced his indignation over the conditions that had been found to prevail in Bethlehem. He went to the strikers' meetings and cheered them on.¹ The Protestant ministers, some of them, went to the strikers' meetings too. But they did not go to encourage the men in their fight against conditions that were repugnant to every article in Bethlehem's early creed. They went to conciliate. They did not try to help the men establish their right to Sunday rest nearly as hard as they tried just to end the strike.

We mustn't forget that the strikers made it hard for the ministers to help them. They practically dared the ministers to do anything else but come into camp. And then too there were the false statements that had been sent out by the federation organizer and printed in the labor press. It would be hard for anyone to co-operate enthusiastically with men in a state of mind like that.²

But it was terribly unfortunate that the ministers could not see that a principle was at stake here—a principle so big that they could not afford to think of personalities. It was a question of fundamental human rights and involved several thousand honest, law-abiding

¹A large part of the employes of the Bethlehem Steel Corporation, especially the immigrant labor force, are Roman Catholics. So too is the president of the Bethlehem Steel corporation. In a little mountain village of western Pennsylvania, where, in the first years of the last century, a Russian nobleman who had taken holy orders erected a log chapel, and gathered around it one of the most devoted Catholic rural settlements of the Alleghenys a memorial church has been erected, perhaps the most beautiful rural chapel in all America. The donor is Mr. Schwab, who grew to manhood in Loretto and went to the seminary there. So that, in a way, this issue of Sunday labor between master and men in Bethlehem was an issue which involved on both sides members of this one communion, more than the Moravians or the kindred Protestant Churches, which are strongest in the English-speaking half of town. And in reviewing the course which the Protestant ministers took in the events of the strike, it must be remembered that however valiantly the individual priest stood out for his men, there was no public evidence of concerted action on the part of the Catholic Church as a whole in support of those who wanted a cessation of Sunday toil.

²They had some leaders—those strikers—whose heads were turned by a little brief authority. They wrote a letter containing a request to Senator Owen and ended the letter thus: "Should we fail to receive a reply from you within a reasonable time to this letter, we shall conclude, and so publish the fact, that you are with Mr. Schwab and against the workers; that you favor long hours, small wages, and the desecration of the Sabbath day."

men, who were not responsible for the pettiness of their unwise leaders. Good men are sometimes blind to the truth. The ministers must have been blind, or they never would have published a statement in the local press telling the striking workmen that

only the officials of the company can accomplish the righting of any existing wrongs!

The *officials*, mind you, who had discharge five men for protesting against Sunday work, and three more for mentioning that they were dissatisfied. Or they never would have asked the workmen:

Is it reasonable to expect that by attacking your employer openly and in secret, by trying to destroy his property and his business, you can best persuade him to deal *generously and magnanimously* with you? (The italics are mine.)

I do not want to give the impression here that the ministers were afraid to take the part of the workmen or that they were unduly influenced by the steel company. Not at all. I have looked into the matter and I am confident that the churches of the Bethlehems do not derive their support from that source. But they did not show a positive allegiance to those things for which they are stewards. These ministers in a very real and peculiar way are the natural custodians of the faith of the founders of Bethlehem, which was in an unusual degree a faith in men. They forgot that, I think, for a little while. It was contravening the established customs in Bethlehem to strike for anything, it is true. But if John Huss and John Calvin and John Knox and Martin Luther had cared much for custom—would there have been any Protestant churches in Bethlehem in 1910?

So the workmen lost the strike. Along in May, 1910, they went back to work.

Just a month before this article went to press I was in Bethlehem. I went there to find out how the workmen had fared after losing their strike. I did not find out much about that. But I found out some other things that seemed to me rather important. A year and a half has gone by since the strike ended, and some of the people of Bethlehem

are still quibbling about the strike being one of non-residents—because some of the leaders of it lived in Allentown, a few miles away. The people have not inquired whether conditions have been alleviated. The citizens of Bethlehem do not know. Instead, they are still ringing the changes on the words “non-resident” and “agitator.”

There has been a slight advance in wages since the strike. Some of the men who were getting 12½ cents an hour are now getting 13½. Some who were getting 13½ are now apparently getting 15. But I was told that there are still some men who get no more than 12½ cents an hour. I was also told that men paid by the ton have suffered a reduction since 1910.

I cannot vouch for the wage figures. They were not verified from the payrolls. But everybody in Bethlehem knows that Sunday work is going on at the steel plant. Nobody outside of the company knows how much Sunday work there is or how necessary it is, but the word has gone forth that it is optional with each man—he may work on Sunday or not, just as he pleases. And Bethlehem seems to be satisfied with that assurance. But nobody has made sure of it. And no one can say that the system really works.

How *could* Sunday work—seven-day work—ever be optional with all the employes? If it actually is optional, then we must understand that the steel company runs the plant on Sunday just to accommodate its employes who want to work. And if none of the men want to work, then the plant will be closed. Wouldn't that be allowing a considerable amount of “dictation” in the running of “our business?”

I talked with two foremen who work in departments where there is Sunday work. One was in the gun department, where, he told me, 1500 men work seven days a week. They were wary—those two foremen. Yes, they said, Sunday work was optional; nobody had to do it. But when I questioned them further, both admitted that they were in the habit of “asking” the men to work on Sundays. One of them said that if a man didn't want to work and could give a

good reason for not working he would "let him off." And the other said that in a slack time, if he were "laying off" men, he would let those men go first who had objected to working Sundays. When I enquired of workmen and induced others to make inquiries for me, I found the idea was strangely prevalent that Sunday work is not "optional."

Charles M. Schwab, the president of the steel company, was in Europe at the time of my visit to Bethlehem. Archibald Johnston and Henry S. Snyder, vice-presidents, were also out of the country. So I went to the general manager who was in charge of the works and asked him for a pass into the plant so that I might see for myself just what conditions were. I went in good faith, because I wanted to give the better side of the story, if there was a better side, and to give due credit for improvements in labor conditions if any had been made.

But the general manager would not give me a pass. He would not tell me whether any improvements had been made or were contemplated. I tried to talk with him about the scheme that the Steel Corporation, the Lackawanna, and other steel companies are adopting, that provides for twenty-four continuous hours of rest for each man every week. But he wouldn't talk about that either. "Of course you realize," I said to him, "that your attitude is a peculiar one and that I can't help wondering why you refuse to discuss these things, and why you refuse to let me see the inside of your plant—unless it is that you are not adopting the progressive measures that some of the other steel companies are adopting and that your plant is in a bad condition."

"I know it," he answered me cheerfully. "Those are natural suspicions. We, have to run that risk when we

refuse to let you go through. But we are through with investigations. We haven't had a square deal, and we don't propose to co-operate any further with investigators, no matter who they are."

"Is it your opinion," I asked, "that these things are none of the public's business?"

"It is the business of that part of the public that works for us," he told me, "the rest of the public can find out if they are able. I've no objections to your finding out all you can by talking with our men." And with that he shook my hand cordially and I went away.

I enjoyed that interview. I like to talk with a man who doesn't hedge.

But it's no joking matter that ten thousand men are working for a company that will discharge any of them who object to the conditions of employment, if the objection is made collectively. It's a serious matter that the Bethlehem Steel Corporation is working large numbers of men seven days a week in departments where there is no technical excuse for continuous operation. And it is a very serious matter that the steel company regards its treatment of labor as nobody's business but its own. The general manager intimated that it was the business of the men also. But when the men tried to make it their business they were speedily dropped from the payroll.

All this, it seems to me, is considerable of an overturning of the old Bethlehem ideals. The old ideals made men care about other men's welfare. There was injected into

American life by the founders of Bethlehem something that we need—something that we cannot afford to lose; something that wasn't so manifest at the beginnings of Chicago, or Buffalo, or Pittsburgh, or Birmingham. I cannot believe that the old spirit is dead in Bethlehem. I know it is not. But it needs a new birth.

CANNON: TEST-TUBES :: SWORDS: PLOW-SHARES

THE SAFETY DEMONSTRATION OF
THE FEDERAL BUREAU OF
MINES AT PITTSBURGH

PAUL U. KELLOGG

Straddling the headwaters of the Ohio and commanding the trade routes north and south, Pittsburgh was tense with feeling in the early days of the Civil War. The resistance of the men of the town to the shipment of guns from the arsenal to the South in 1860 is described in the local histories as the first overt act of that war. A story told me by an old resident is that the tension all but snapped when a wagon loaded with ammunition unaccountably blew up. Whether it was an accident or part of a plot is no matter to-day; but it is a very great matter that the old arsenal, forty blocks up the Allegheny river front, is taking on new life after decades of disuse. It is a hatchery no longer for war. Here in the dour stone buildings, inside the high grey walls, with old army mortars turned to use as tools, are being carried on experiments designed to pull the fangs of explosives, so that they can be used harmlessly in the arts of peace. And the change which has come over the place itself is no whit greater than that which is revolutionizing the practice of American mining from the standpoint of safety.

The arsenal is still nominally under the jurisdiction of the War Department, and at it is stationed the most important high-sergeant of the United States army; for under his nominal suzerainty are the laboratories and persons of the remarkable staff of engineers and scientists through which the Department of the Interior is addressing itself to that great constructive phase of conservation which opened with the creation of a Federal Bureau of Mines in July, 1910.¹ Here, October 30 and 31, under the auspices of

the bureau, the American National Red Cross, the United Mine Workers, and the Pittsburgh Coal Operators' Association, was held the first National Mine Safety Demonstration in America. Three or four mine rescue cars (the government has seven, Illinois three, and certain operators, like the Colorado Fuel and Iron Company, have their private ones) were shunted into the sidings. Lignite and coal briquetting machines, gas producers, foundry cupolas, smokeless boilers, and other experimental apparatus were set in motion. The various laboratories made the hearts of the physical scientists glad with their instruments for determining thermal conductivity at high temperatures, for proximate and ultimate analyses of peat and coke, for investigating fuel oils, mine air, ash, clinker, boiler-water, and what not. But the crowd was not altogether different from other crowds, and it was about the big apparatus in the outer yards, in tow of young engineers with megaphones, that you found mine inspectors from a dozen states; superintendents whose word goes with 5,000 men; professors from the scientific schools; Welsh, Irish, Scotch pick-miners; Old Believers with flaring beards, and mine owners with the look of city club men; engineers who know the bowels of the Andes and the Rockies, as well as their neighbors know the Pittsburgh seam. All the world loves a bang, and if the government only builds enough steel galleries for testing explosives and mine gases, and touches them

¹As the successor to the Technologic Branch of the Geological Survey, the real work of the bureau may be said to have been going on since 1907, the year of the greatest death toll in American mining, which closed with four tremendous December explosions, killing 700 men.

GAS AND DUST-EXPLOSION GALLERY.

This is a great tube of boiler plate, as big as a trunk-sewer, in which mine conditions are duplicated for purposes of experiment. The first day of the demonstration, the gallery was filled with a mixture of gas and air containing 7 per cent of methane and ethane. When the old-style black blasting powder was used, the explosion shook the gallery, ripped up the safety-valves, and burst out the end.

off on Independence Day, it will solve the safe and sane Fourth problem. They are firecrackers of half-inch boiler plate, 100 feet long and six feet through. But these men who pushed at the ropes, and saw the smoke belch up, understood what the roar was saying. They knew that 30,000 miners were killed in the United States in the last ten years; that 75,000 were injured, many maimed for life. They knew that these explosive tests showed that with the old long-flame black powder in common use when the government began its investigations, a miner took his life in his hands every time he touched off a fuse.¹ They knew that when the government set out to prove that coal dust was the greatest menace of the mines, a majority of miners and operators held that coal dust would not explode in workings free from fire-damp. This public demonstration was but a final step in a process of education, which had brought mine men singly and in groups to the arsenal in the past, to see for themselves. State Mine Inspector Laing of West Virginia tells of a hard-headed Welsh superintendent, who fought all the innovations of the scientists, and scouted the idea of coal dust exploding. He was induced to bring his dust up with him to Pittsburgh, scatter it in the gal-

lery, tamp the shot, and set it off. Like the farmer when he first saw the camel—"Hell, there aint' no such animal!"—he wouldn't believe his eyes. Twice he did it; three times; then he went home, and now there's no better evangelist for the new ways in all the Alleghenies.

As a clincher to these experiments the bureau dug an experimental mine near Bruceton, Penn., sinking it in the Pittsburgh vein, and equipping it with explosion doors, concrete portals, one surface and four underground instrument chambers for recording pressure variations and velocity readings and taking gas samples. We are used to seeing the navies set off torpedoes under their old battle-ships; but it remained for the United States to dig a mine for the good of blowing it up. All the methods proposed by the engineers for preventing and checking explosions in progress will be tried out in this hole in the ground. A preliminary test was made the week before October 30, but the final demonstration of the explosibility of coal dust under actual mining conditions was reserved as the big feature of this national gathering—until after a thousand visiting experts had filed into the black entry, inspected the coal dust placed along shelves, a pound for every foot, and noted the drill hole in the far end where a charge of black blasting powder was to

¹A greater quantity of short-flame explosives has come into use in the United States since than is employed in the mines of Great Britain.

be set off by electricity to represent a blown-out shot.

After the manner of Sunday-school picnics from the beginning of time, it drizzled that afternoon, but the thousand mine inspectors, mine workers, mine owners, engineers, superintendents, and chemists did not stay home on that account; and after the manner of watched pots since the stone age, it fizzled, that giant fire cracker; and mine inspectors, mine workers, mine owners, engineers, superintendents, and chemists stood ankle-deep in a plowed field on a hill-side, shooed up to coigns of safety by the state constabulary, and held fast by the cold mud from three in the afternoon to half-past six. Once, twice, three times the government men tried it (the wiring was defective), before the mine went off.

But go off it did, finally, the night silhouetting the stupendous breaker of churning flame into the most wonderful piece of fireworks ever seen. It poured over and up, toppling the tall trees of the grove, setting far branches afire, and making the ears ache.

In the dark a sober crowd groped down the slippery paths to the special train. Men who had helped carry out bodies from Monongah, and Darr, and Marianna, knew what little chance there had been for them in the path of such forces; they knew that had this demonstration come five years earlier those 361 men at Monongah might now be living men; and so with the rest.

But to know the secret which the seared mine-mouths kept so long is only

SMOKE ROOM FOR RESCUE TRAINING.

The men are wearing various types of artificial breathing-apparatus. The plate at the left shows the oxygen tanks worn on the back, which permit breathing for two hours in deadly atmospheres. To work to advantage, a rescue man must not only be accustomed to breathing the artificial air, but to handling himself in his helmet against all sorts of odds. To force a way through the débris of a wrecked mine is more strenuous than surf-bathing or foot-ball; prowess at it demands training. This smoke-filled chamber, with its passages for crawling, climbing, etc., is used for practice work.

the beginning of prevention. The dust is there and must be conquered. Expert shot firers and the safety powders are one line of attack; water sprayed in the passages and exhaust steam turned into the ventilating currents may keep the dust from igniting; zones of rock or shale-dust, clay or sand, may keep the flames from spreading. Still other lines of protection are anticipated; water pressure may even supplant powder as an agent for loosening coal. Moreover, explosive dust is a characteristic only of bituminous mines; mine-fires and gas are to be reckoned with here and elsewhere. Further, 50 per cent of mine fatalities are not due to any such spectacular causes which can be struck at with sweeping blows, but are due to falls of roof. Again, 29 per cent of the miners of West Virginia are to-day Southern or Eastern Europeans; 43 per cent of those killed or injured in the state in the last five years were of this recent immigration, among whom not one out of five has had mining experience in the country from which he came. Such facts seem to call in the name of safety for a fixed period of apprenticeship for miners. The campaign of human conservation thus entered upon by the bureau of mines, promising as it is, is therefore only fairly broached. The bureau's relations to the mining interests is that of "helpful co-operation and not of intrusion or of interference." It supplies the progressive operator with demonstrated fact and method; the progressive state with standards which it can set in law and enforcement.

The first aid exhibition in Forbes Field was an illustration of this co-operative work of the federal service. President Taft spoke, Secretary Fisher, Governor Tener, Miss Boardman of the Red Cross, and others, but the stars were the helmeted rescue-men and the long lines of first aid teams, in blue jumpers, flannels, khaki, and even white ducks. Six rescue stations are maintained by the Bureau of Mines, in addition to its seven rescue cars. In many instances the cars cannot arrive at the scene of disaster in time to be of service, their chief use

being to travel from point to point and to train resident miners in rescue work. Five thousand were so trained the first twelve months of the bureau's existence; there are to-day 300 oxygen helmets throughout the coal fields, and in the last two years between thirty and forty coal companies have purchased rescue equipments; three states (Illinois, Kentucky, and Ohio) and fifty companies have established rescue stations. First aid work was started about 1899 in the anthracite fields, where it is now practically an essential feature of mining, one miner in fifty having knowledge of the work. When the American Red Cross organized a separate first aid department it employed Dr. M. J. Schields of Scranton; and at about the same time the Young Men's Christian Association made first aid a part of their educational work. The Philadelphia and Reading sent down to Pittsburgh a corps with badges that showed a long string of victories in local competitions in which no less than seventy-eight teams participate. Eight teams recently contested in a Colorado meet; the work of the Tennessee Coal and Iron Company in the Birmingham district is a story in itself; the Northwestern Improvement Company sent a team east from Tacoma; and the bituminous districts turned out largely for the Pittsburgh demonstration.

It was a field day for safety. The cheering bleachers and, even more, the personal interest of the big operating men, bespoke the miracle of a new front—constructive, organized, aggressive—upon the grim fact that six miners go down each day in the coal pits of the United States never to come up again. The conservation of mineral resources, efficiency, the elimination of waste in combustion, the development of new fuels—all fall within the scope of the Federal Bureau of Mines: all are receiving attention; but "Safety first" was the slogan printed on the Pittsburgh program—printed over and over again in the tongues in which it means life and death:

"Ben pecnost—Prva."

"Sicurezza—Prima."

"Bez pieczenstwo—Pierw."

"Biz tonsag—Elso."

¹A comprehensive report on accidents in coal mines as affected by immigrant labor was prepared by Earle Clark for the Federal Immigration Commission and is to be published in its findings.

UNDER THE BORDER LIGHTS

MARY BOYLE O'REILLY

They sat side by side watching the moving pictures—the vaudeville artist and the social worker; one beruffled, plume-crowned, with flaming cheeks, the other correctly austere in serge and furs. The tentative way in which the vaudevillist opened a stick of gum indicated her willingness to make friends.

"Are there many moving-picture theatres in Boston?" asked the social worker.

"There are thirty-eight—going on thirty-nine," answered the other in an odd, metallic voice. "You come from the country, perhaps?"

"Well, not very far out. What is the chance for a girl in vaudeville—Ah! what a pretty picture!"

"You think so?" the professional tone was a little patronizing. "For me, I hate them pastoral scenes. But I love the villains! You see I do a song-and-dance act myself. I'm Miss Della Dalrymple of the Imperial. . . . I don't think I caught your name."

"Mamie Riley," murmured the other humbly.

"My! is that so! Well, Miss Mamie Riley, I'm not one to stand in no girl's way, especially if they're tired of their job. But take it from me straight: when you've been in this burg as long as I have you'll know that any work gets to be slow when it means your bread and butter."

In the half-dark a girlish figure came up the inclined aisle.

"Hello, Stella," called the vaudeville girl. "Do stay just a minute. Sit here. Oh! my eye! What a grand raglan! Fourteen ninety-eight! *And a willow plume.* My, but you are an up-to-date dresser! Oh! x'cuse me. This is my lady friend, Miss Mamie Riley, Miss Stella Stapleton. She's looking for a job. Say, Stella, why ain't you working at the Royal? You didn't have *another* row with that old skinflint?"

The newcomer's young face hardened instantly; her glance sought refuge on the biograph screen.

"Meb'be," she answered defiantly. "Anyway, I'm through. Della Dal-

rymple, I'm just tired of working. What is the use of always getting barely enough to keep alive. . . . Never a cent left over for a little fun. Del', you're twenty and I ain't but nineteen—I tell you I'm sick of living. Did you see in the paper today where it said how that woman in the Back Bay spent ten thousand dollars for one dress? *Ten thousand dollars*, and us like this!" She thrust her slender arm beyond the loose cuff of the fawn-colored coat to show a sleazy silken sleeve rubbed and ragged along the seams. The poignant bitterness of her tone forbade expostulation. The two other women watched her miserably.

"Well, I must be going!" She rose abruptly with a swish of skirts. "Pleased to have met you, Miss Mamie Riley. So long, Della," and she was gone.

"Honest, she ain't to blame," explained Miss Della Dalrymple, "she just wasn't born to be happy. Back home she sang in the church; but she was bound to sing in grand opera. So she cashiered in a store to earn money and somebody said—what wasn't true. Wasn't that sickenin'? She thought she couldn't face the cutting looks, so she ran away."

"Could we help her a little, perhaps?" asked the social worker.

"My, no, Stella would starve before she took a cent!"

"I did not mean money, exactly," explained the other, "but just being friendly; letting her know we care; giving her a lift out of the loneliness."

"Oh, I see," commented Miss Della Dalrymple, in a tone that proved she did not see at all. "That's acting real kind, I'm sure. But I'm afraid Stella don't go to your church."

"What has that to do with helping? Surely we women can lend each other a hand, whichever our church."

Miss Della Dalrymple drew a long breath.

"Honest, that sounds good to me," she said. "That's what you call being a philanthropist, ain't it? Say, I'd like to be one of them philanthropists *my-*

self. Still, I think religion's a real interestin' thing to talk of, don't you? Well, I *am* glad." She sat back sideways, facing her companion in the warm dark. "You see, nobody troubled much about my religion—sure, I know, "*Now I lay me.*" 'Course I went to sociables and choir practice like everybody; but, honest, I picked up the Lord's prayer for *myself*. When you stop to think there's a whole religion right in that one prayer. Sometimes I wonder if I thought that all myself or just saw where somebody wrote it. You see I always read the religious pieces in the newspapers. I think President Eliot is real interestin' when he talks about that there universal church of his. I always cut them pieces out. No joshin'. I think they are real educatin'. But say, do you know—it ain't for me to be knockin' President Eliot—but I sometimes think he hasn't thought all the way round that idea? Back home, in my little town, there was four barns of churches and only fifty-eight voters. It was mostly deacons that handed out the seven deadly sins and the wrath to come to their intimate friends. But I'll put you wise; them churches wasn't too small to have four rows going on in every one of them all the time. Well, I guess! if we all belonged to one universal church wouldn't it be a continuous performance?"

"It certainly would," laughed the social worker, but next instant Miss Della Dalrymple's mobile face was serious.

"I learned a lovely poem once," she said gravely. "It told what you said just now about giving a girl a lift. I cut it out but I never thought of doing it for a good action. But say, after this I'm going to do my share. There's Stella Stapleton now you saw a minute ago. . . . Don't she just need somebody to be friendly? She's working at the Palace, I'll bet, just by her looks. Oh, gee, she was a nice girl! She was the best dancer ever. . . . Why, she could kick off a man's hat as easy—as easy! But one day she up and talked to the rest of the pony ballet about their ought to having a dressin'-room and the manager guessed it was her the first rattle. Say, he didn't do a thing to her. . . . just starved her out. . . . Half-time acts and four dollars a week. . . . Well,

when he got her down the old *hy'ena* offers her a chance clog-dancing in teamwork with Jim Reagan. My, but he was a mind-reader! Of course she took it. Wasn't she hungry, I tell you! But when she came back from the long circuit—ten dollars a week, and four days in a train—she was sick and tired of working and dotty on Jim Reagan. . . . Now, there ain't no harm in Jim Reagan. . . . He's got that kind of a face—and a cigarette, you understand, that if you look at him long enough you'll be stuck on him for fair. Well, I guess it was a shame! Before that Stella was as slick as silk. . . . Now he has her on the slant. You can take it from me for a fact she's gone so crooked that if the Pope of Rome was to try and straighten her out the old gentleman would be tired of his job. I says that 'cause Jimmie and Stella is Catholic-Catholics. That's what they was raised, and that's what they'd better live up to. Now there's Catholic-Catholics—they think well on the saints, and bein' sorry for your sins; and then there's just Catholics, *they don't*, but they're tonier, more style, and no bother, and they call theirselves the High Church of England. . . . My! don't my mind wander something awful? We was talking of Jimmie and Stella. Honest, you've given me the real helpin'-hand idea. It looks like they was up to me. Well, you can listen for Stella's wedding bells to ring! *Adios!*"

And gathering all her properties she fled to dress for her turn.

A few weeks later Miss Della Dalrymple stood before the social worker, both beringed hands laid carefully on her supple hips.

"Well, say, don't being a *flanthropist* get to be real responsible?" she asked soberly. "I suppose you've heard about Stella? No? Well this is a big world and it's full of busy people. You haven't forgotten I was bridesmaid for Stella and Jimmie? Well, now I've got to find a godmother for the baby! You never tumbled there *was* a baby? Well, honest, I *was* surprised! Between you and me, now, wasn't it a lucky baby? Some infants is born lucky and some just has luck thrust upon them. This is one of the times you can take your choice.

Is Stella pleased? Well, I guess you don't know Stella. I told her last week: 'Miss Stapleton, you've got to cut out that Bloom-of-Youth if you don't want to poison the only child you ever had. And she done it right off. And Jimmie? Well, honest, I have to smile. He's cut down on his cigarettes, and he says Stella ain't going to dance no more. 'The mother of my child,' he says, 'ain't going to appear in no ten-cent theater.' Ain't that perfectly grand? I'm glad, for I feel real responsible about that baby; just like it was mine—without any scandal, you understand. While I thought it was going to die I didn't say nothin'; but now it's pickin' up to get real well I'm just set on havin' it christened. You see, I'm off on the long circuit: Nova Scotia and the Provinces for mine, and the Lord knows where Stella and Jimmie will be when I hike back. So I up and talks to Stella about the christening, but Stella she was shy to go back to that church just now. She thought it looked too soon. . . . Was I pleased? Not me! I just put on my hat with the willow plume and up I went. It was a new priest came into the parlor. He was *young*, you understand. Did he hand me a frost? Oh, no, not at all. But I says to myself: 'My friend, if you wasn't so nasty nice I'd break it to you gentle that only for me *your* church would be short a baby.' But he listened all right; and say, it was surprisin' how he caught on. Honest, he wasn't so awful young after all. At the end he says: 'Sunday at two: No, I will not forget. Good bye, Miss Dalrymple; you are a good woman. May Gaw'd bless you.'

"Well! I was took back! Before I thought I says, 'Say that again and say it slow.' Then he smiles—my, but he had a lovely smile—that smile in top-boots and doublet would bring fifty dollars a week! So I says, 'Go as far as you like. I'm putting you wise. It's going to be a screamer of a christening and I'll be the godmother.' Then he looked real solemn. 'I'm sorry to hear you have planned that, Miss Dalrymple,' he says, 'because I will have to disappoint you.' No, he wasn't stringing me. It wasn't on account of me being in the chorus. I'm betting *he* never heard of

the pony; it was the rule, you understand. There are awful strict rules over christenings. No, I wasn't mad. Honest, I have strict rules. Somehow you kind'er feel they *belong* to a company you'd like to get into.

"When he explains, I says like this, 'Don't you worry none. I'm going to see this act through on the level. Leave it to me.' And he says, 'I will.'

"So I hikes back to the boarding-house to find a godmother, thinking all the time of Mrs. Barrington-Brown, *Mrs.* Barrington Brown, you observe. Gee, but she's a hummer. She's in stock. And I says to *Mrs.* Barrington-Brown, 'Say, *Mrs.* Barrington-Brown, ain't you a Catholic—I mean a Catholic-Catholic?' And she just screams, 'Oh! Del! what makes you think that?'

"Then I says, 'Well, no harm meant, of course, but there's something about your profile makes me think you are.'

"'Well, I was, once,' says *Mrs.* Barrington-Brown, real sad. So I said, 'Well, seeing we're in a hurry, that's good enough for me,' and I told her about them strict rules and the christening. But *Mrs.* Barrington-Brown took to crying and wringing her hands. 'Oh! Del.' she says, 'I can't, honest I can't; and what's more I darsen't. Del', I've forgotten the Lord's Prayer and I don't know the Creed any more. What could I do?'

"'Do?' says I real short and sharp, 'Do? *Mrs.* Barrington-Brown, you make me tired; don't you try no Lady Macbeth business on me; this is the time I've got you dead to rights. What would you do? Suppose you was playing one-night stands on the road and the act didn't go. What would you do? You know well enough that you'd hike to your room and study your lines. And that's what you're going to do *now*. I can't be that infant's godmother, and you're going to. *Rules is rules.*'

"That's all, of course, except I'm going to have my way. It sounds awful sober, but you can take it from me straight, it would make a cat laugh to see me in my dizzy-lizzie make-up teaching *Mrs.* Barrington-Brown what she believes. Now, honest, don't being a *filanthropist* get to be real responsible?"

THE STRUGGLE FOR THE BRITISH HEALTH BILL

RANDOLPH J. BRODSKY

DR. BRODSKY WAS FORMERLY CONTRIBUTING EDITOR OF THE *Mutual Underwriter* AND THE *Fraternal Monitor*. A GRADUATE OF THE UNIVERSITY OF HEIDELBERG, HE WAS ENGAGED BY PROFESSOR CHAPIN AS AN ASSISTANT IN HANDLING THE STATISTICAL MATERIAL FOR THE VOLUME ON THE STANDARD OF LIVING AMONG WORKINGMEN'S FAMILIES IN NEW YORK CITY. HE LATER INVESTIGATED FRATERNAL AND PRIVATE INSURANCE IN THE UNITED STATES. DURING THE PAST SUMMER, DR. BRODSKY HAS BEEN IN GERMANY, FRANCE, BELGIUM, AND ENGLAND STUDYING THE ORGANIZATION AND ADMINISTRATION OF WORKMEN'S COMPENSATION AND INSURANCE.

THE ABC OF THE INSURANCE BILL

(Introduced by Mr. Lloyd George on behalf of the Liberal Government.)

1. Every working man or woman whose wages are less than 23 a week will have a chance of joining a good Friendly Society at less than half price.
2. It costs on the average 9d. a week to join a Friendly Society with good benefits.
3. Every man whose wages are over 15s. a week will contribute 4d. a week from his wages (3d. a week for women).
4. Those who earn less than 15s. a week will contribute less from their wages, down to the woman or the boy with 9s. a week, who will only contribute 1d.
5. The employer and the State, between them, will have to make up the rest of the 9d. a week necessary to insure the man (5d. for the woman).
6. Every man who contributes this 4d. a week from his wages (3d. in the case of women) will be entitled free to all the benefits that 9d. a week can buy him in the best Friendly Society. The State will pay the 5d. a week for him.
7. If a man is already a member of a Friendly Society, contributing more than 4d. a week, he will not need to contribute anything more in future, but rather less.
8. If he now contributes 9d. a week to his Society he will be able to save 5d. a week after the Bill is passed, for he would then be able to get 9d. worth of benefits for 4d.
9. Or, if he preferred, he could continue to contribute the same as before and get nearly double benefits.
10. Any person up to the age of 65 can join any Society on as good terms as if he (or she) were only 18. The State will pay the difference.
11. The workmen themselves will be able to exercise control over the administration of the insurance scheme. They can elect their own officers and say whether sick pay is to be granted or not.
12. For 4s. a week (women 2d.) the insured person will get five benefits: Medical Benefit, Sanatorium Benefit, Sickness Benefit, Disablement and Maternity Benefits.
13. If there is a surplus, after these benefits are paid, as there is certain to be, he will get additional benefits.
14. Medical Benefit means free doctors and medicine.
15. Sanatorium Benefit means free residence at a sanatorium for consumptives, with sick pay for his wife and children.
16. Sickness Benefit means sick pay of 19s. a week (woman 7s. 6d.) for the first 13 weeks and 6s. a week for the second 13 weeks.
17. Disablement Benefit means 6s. a week during permanent disablement or invalidity.
18. Maternity Benefit means 30s. for the wife of an insured person at childbirth.
19. During sickness the man who is insured under the Bill need not continue his contributions, and his Society will not count him in arrears.
20. During unemployment a contributor is not required to continue his contributions so long as his unemployment does not exceed an average of three weeks a year. If he fails to pay his contributions for a longer period through unemployment, up to an average of thirteen weeks a year, he may still draw benefits at a reduced rate. At present members of Friendly Societies have got to keep up their contributions both during sickness and unemployment.

A LEAFLET DISTRIBUTED BROADCAST IN THE LLOYD GEORGE CAMPAIGN.

Since the repeal of the Corn Laws no British legislative measure has aroused such intense interest as the National Insurance Bill. Neither the Morocco incident that nearly ended in war nor the great railway strike that temporarily paralyzed trade caused any abatement in this interest. This is the high-water mark of socialized British Liberalism. It represents the entire abandonment of the old liberal-individualistic doctrine, both in the assumption by the state of responsibility toward its economically weaker citizens, and in the forcing on those citizens of a compulsory principle hitherto believed to be antagonistic to the very foundations of the "free-born Briton's" character. The National Insurance Bill is a colossal scheme covering as it does 14,000,000 people.¹ In contrast, the existing friendly society benefits only reach, at the outside, some 5,000,000

¹The health insurance system only is discussed here. An outline by Prof. H. R. Seager of the whole British Insurance Bill, including both health and insurance features, appeared in THE SURVEY of September 23. As originally planned, the bill included pensions for widows and orphans, a feature only this year added to the German system of state insurance.

persons, the trades unions 2,400,000, and these the most prosperous of the working community. The rest can only take out death benefits at disproportionate expense in industrial insurance organizations. Asserting the inadequacy of voluntary and industrial insurance and of charitable institutions, the English labor movement has urged compulsory state insurance and other social legislation during the past decade. The Liberal Government, recognizing that Germany with its vast system of state care for the working population has increased national efficiency and out-distanced England in the competitive struggle for the international market, adopted the social program urged upon them by labor, as much from motives of economic self-interest as of social reform.

Aside from its scope, embracing the vast majority of the working population of the British Isles, and taking in not only the care but the prevention of disease, the bill is peculiarly interesting in that it makes skillful use of existing

English agencies together with new administrative institutions patterned on the German experience; and that it comes at a time when the problems of poverty and industrial stagnation have become acute. When the bill was introduced in Parliament last May by Lloyd George, chancellor of the exchequer, it met with spontaneous approval, the Opposition uniting with the Government in its support. Gradually, however, the full significance of each provision became clear to the various interests that would be affected, and difficulties arose for adjustment. Friendly societies which maintained coöperative drug stores came into conflict with the pharmacists who, under the bill, were given the right to dispense all medicines. The hospitals claimed that the bill would increase their cases and that the insurance rates would deprive them of many voluntary contributions from working people and employers; therefore they demanded state payment for in-patients, as well as exemption from payment for their own employes. Householders and farmers also demanded exemption. Suffragettes and representatives of working women complained of the inferior terms under which the benefit would be paid to women—in return, it is true, for a lower contribution. Insurance companies operating among industrial populations and fearing that the bill might cut down their business asked to participate in the insurance system. Small societies objected to the 10,000 membership limit set in the first draft of the bill. Employers felt that the whole community should share the burden. Though the Labor party as a whole supported it, a minority in that body, as well as the Dockers' Union, the Social Democratic Federation, and the Anti-Sweating League, opposed the contributory features and the treatment of poorer insurers vigorously. The Irish labor unions contended, as a matter of course, for home rule.

The chancellor, for many years president of the Board of Trade and a skilled arbitrator, mollified these and many other opponents. A greater difficulty was, however, encountered in satisfying the claims of doctors and friendly

societies. A preliminary review of the Insurance Bill is essential to a discussion of the claims of the critics, particularly of these two groups.

Lloyd George's health scheme, which was framed with the co-operation of the friendly societies, covers sickness, invalidity, and maternity. Out of a total wage-earning population of 19,000,000, 14,000,000 persons are to receive its health benefits as compulsory insurers. These fourteen millions include all working persons under sixty-five years who are in receipt of an income not exceeding \$800 a year, with the exception of those working on their own account, wives working for their husbands, casual domestics and workers, commission agents working for more than one employer, and pensionable government employes. Sailors and soldiers are to be covered by a special fund. In addition to the compulsory insurers, special provision is made for voluntary insurance, which will probably take in some 850,000 persons, the majority being wives of compulsory insurers. On her marriage a woman's contributions while compulsory insurer are returned to her.

Those insured under the compulsory scheme are divided into two groups, members of approved societies and post office or deposit contributors. Under the term "approved society" come trade unions, clubs formed of policy-holders of industrial insurance corporations, and friendly societies. These approved societies must be self-governing organizations, not on a profit-making basis, with membership large enough to secure against risk, and must provide medical treatment and money benefits.

Employers' benefit funds are allowed in this group under certain conditions. They must, however, be in a position to grant the minimum benefit for the statutory contribution. Any member is, however, given the right to transfer his subscription and his employer's share with it to any ordinary society, if he desires to do so. The principle of self-government remains, but the employer is allowed one-fourth representation in the management of the society, if he makes himself responsible for the solvency of the fund. The requirement as

to a minimum number of members is not applied to employers' funds.

It has been estimated that 12,000,000 persons, or 86 per cent of the insured, would be members of approved societies existing or created. Those who do not wish to join benefit societies or who are disqualified for membership by physical, mental, or moral defects constitute the post office or deposit contributors. This class, which will number some 900,000 persons—14 per cent of the insured—represents low risks, that is, high morbidity and mortality rates. Special precautions have therefore been taken against possible depletion of the treasury. The post office depositor is deprived of invalidity insurance. His waiting period for the sick and medical benefit is prolonged and under ordinary conditions the sick benefit he is allowed to draw must not exceed the amount of his deposits. Under certain conditions, however, the local health committees who administer the benefits of this group of insured may, with the consent of the treasury or the local authority, enlarge the benefits of post office depositors by spending more money than the actual amount of the contributor's deposit upon medical treatment, the treasury and local authorities

the age of sixteen, it is estimated that the following expenditures will be necessary for each person participating:

1.51d.	for doctor
.32d.	" sanatorium
.92d.	" administration
.64d.	" maternity
2.16d.	" sickness
.78d.	" disablement
<hr/>	
6.33d.	
.67d.	margin
<hr/>	
7.00d.	total

As the contributions per beneficiary from all sources amount to 9d., a margin of 2d. per beneficiary will be provided for; that is, a reserve amounting to the government's own contribution. -

Contributions are uniform for all ages. On the basis of entrance at sixteen years, it is estimated by the sponsors of the bill that the liability accruing from this novel method of ungraded premiums will be wiped out by the government contribution in about sixteen years, during which time the minimum rate of benefits can be paid. The following budget of income and expenditures shows the government's estimates for the next sixteen years, during which it expects to wipe out the initial liability.

TOTAL INCOME AND EXPENDITURES.

	Contributions by Employers and Insured.	Money Provided by Parliament.	Total Income.	Total Expenditure.
1912-13.....	£16,500,000	£1,900,000	£18,400,000	£7,300,000
1913-14.....	18,300,000	3,500,000	21,800,000	13,600,000
1914-15.....	18,700,000	4,100,000	22,800,000	15,600,000
1915-16.....	19,100,000	4,200,000	23,300,000	16,200,000
1916-17.....	19,400,000	4,400,000	23,800,000	16,700,000
1917-18.....	19,800,000	4,500,000	24,300,000	17,100,000
1922-23.....	21,200,000	5,100,000	26,300,000	19,600,000
1927-28.....	22,600,000	5,500,000	28,100,000	21,300,000

each defraying one-half the additional expenditure. The arrangements for post office contributors are tentative for three years.

To members of approved societies the rate of contribution is, in the words of Lloyd George, "4d. for 9d."—3d. for 8d. in the case of women—the remaining 5d. a week being supplied 2d. by the government, and 3d. by the employer. Rates of contribution are graded for those whose wages are under 2s. 6d., the minimum weekly contributions being one penny. To provide the minimum benefits under the state scheme in the case of a man joining at

The minimum sickness benefit obtained for these contributions is 10s. a week for men and 7s. 6d. for women, to begin after the fourth day of illness and continue for thirteen weeks. Those paying lower than 4d. contributions receive correspondingly lower benefits. If illness continues after this time 5s. is provided for the following thirteen weeks. Invalidity benefit begins at the twenty-seventh week and continues at the rate of 5s. until the patient is eligible for an old-age pension. A maternity benefit of 30s. is to be paid to the wives of insured men or to unmarried mothers who are insured. This latter benefit will be paid to some-

thing like a million mothers annually. Besides money payments the insured will receive free medical attendance and medicine, and sanatorium care in cases of tuberculosis or certain other specified diseases.

A comparison of the English with the German system shows the English bill to be more advantageous to the insured in that the workman bears a smaller proportion of the expense and has the entire administration of the funds. The employer bears a larger share of the financial burden and the government contributes not merely as in Germany to the invalidity fund but to that for sickness as well. The maternity benefit is on a basis far wider than that of Germany, where it is so hedged about with restrictions as to reach comparatively few. The estimated annual cost of this maternity benefit in the British Isles will be £1,500,000; in Germany, with a population almost half again as large, it is only £300,000.

The cost of management will be reduced to a minimum by the method of collection through existing approved organizations. The method of collecting contributions, the most vital part of a compulsory plan, is simple. The workman obtains from his friendly society or the post office a card issued by the Insurance Commissioner. To this his employer attaches each week stamps to the amount of the workman's and his own contribution, the former being held back from wages. At intervals these cards are cashed-in to the insurance office by the societies. The sums paid for stamps, together with the contribution of the government, form the national health insure fund. The greater part of this fund will, on the plan of the German Sick Funds, which have in this way cut down their sickness rate, be invested by the National Debt Commissioner in loans for sanitary housing. The friendly societies retain the right to invest the workmen's own contributions.

Sanitary housing is one side of the health campaign; the general work of preventing and caring for disease is the other. This is entrusted to local health committees, bodies which will supplement the work of already existing health

authorities. Their special functions will be the administration of the funds for medical care and sanitation and the conducting of an educational campaign. More important still, they will have the power to demand a public inquiry in cases of excessive local sickness due to neglect of public health, factory, or housing acts. If the case is proved against a local authority, that authority will have to reimburse the insurance fund through the societies or, in the case of post office contributors, through the health committee, for any expenses it has incurred—reimbursing itself in turn from the local property owner at fault, if the fault is a private rather than a public one. This system will mean also the accumulation of invaluable records of public health and the automatic revelation of "black spots" to be cleaned out.

The sphere of action, the powers, and the influence of the local health committees being from the beginning so large, and subject to such indefinite extension, their personnel will be of immense importance. The friendly societies and the medical profession are to be included, besides representatives of county or borough councils and of the post office contributors. General supervision of the insurance system will be entrusted to a Board of Insurance Commissioners—with a central office in London and branches throughout the country—aided by an advisory committee of representatives of employers' associations, approved societies—including trades unions as a balance to the employers' representatives—physicians, and other experts chosen by the commission. Women are eligible for membership in all committees. The expenses of the Board of Commissioners will be met out of the national exchequer.

Such is the National Insurance Bill. Some idea of the number of its critics has already been given. It has been strongly objected to both in principle and in detail. The basic contributory plan has been attacked by the group of representatives spoken of above, who, using the metaphor of the dog who fed upon its own tail, claim that the worker pays both his own and (in enhanced price as consumer) the employer's contribution.

They say further that the contributory system renders the insurance almost useless to the poorest class of workers, who need it most, and who receive back only what they give. The full benefits of the system go, they hold, only to the well-paid workers, who need them least. Other critics object to the total exclusion of the married woman from the compulsory plan. Others again object to the age limit of sixty-five for admission to the system, which leaves an interval of five years during which an aged person is eligible to no state assistance. This latter difficulty, it is expected, will be met by lowering the inferior limit for old age pensions by five years. Lack of funds and difficulties of administration will make it necessary to deal with the other problems by later legislation. The believers in the bill point out that when the accrued liability due to the flat rate system of contribution is met, large sums will be released for extending and perfecting the system.

After this period of debt is passed the plan is to increase maternity, sickness, and invalidity benefits. Besides this increase in existing benefits, the government contemplates adding new ones, such as free medicine for dependents and a benevolent fund for members in economic distress, and extending and improving the whole public health system, so as to make it an integral part of the Liberal scheme of social legislation, which is planned to cover all contingencies, from accident to old age, that befall the working man.

Two serious protestants the government had to deal with. Both are essential parts of the mechanism of the national insurance system: the friendly society because the whole work of organization and management of sick benefit is left in its hands; the medical profession because it is called upon as part of a public scheme to administer medical treatment to some 14,000,000 people. How important complete harmony and close co-operation between these two elements is, is shown by the German experience, where their quarrels have seriously handicapped the system. From the very introduction of the English bill

fears were entertained of a possible collision, and, when the clash actually occurred, the excitement was communicated to the general public, which watched with curiosity the struggle between common friendly society man and "gentleman" doctor. Under the bill the friendly society or trade union is promised state aid, is guaranteed a steady and increased business through a compulsory plan that will give it stability and permanence. It is presented with a reserve fund and, if it already possesses reserves of its own, it will be enabled to reduce contributions for the same benefits or increase benefits for the same subscriptions. It will prosper, but at the price of partial renunciation of the self-government principle and certain other privileges. From now on the government will stand between the friendly society and the individual member; from now on the friendly society becomes an "approved" society; it submits itself to the supervision, regulation, restriction, and reorganization desired by the government. From now on it will be obliged to make regular valuation of its assets and liabilities and will be restricted in its right of investing its sickness benefit funds. None of the friendly society activities except these sickness funds will, however, be affected. In respect to one form of society, the trade unions, it is estimated that the insurance will mean a donation of some \$12,000,000. At the publication of the bill the friendly societies showed a rather sympathetic attitude toward it. They became, however, more reserved when Parliament, under the pressure of the insurance interests represented by the eighty directors of insurance companies who sit in the lower house, extended the definition of approved society so as to include in the scheme the industrial insurance companies and collecting societies, and permitted them to form sick clubs of their policy-holders. These profit-making institutions the friendly societies viewed as dangerous and unfair competitors. They feared that industrial corporations, with their hordes of paid agents and solicitors, would soon crowd them out; that high officials and agents, and not the policy-holders, would

administer the business; that there would be an end of the self-government principle guaranteed by the bill.

Finally, when Parliament, persuaded by the interests represented by the British Medical Association, made changes in the bill that deprived the friendly societies by the stroke of a line of the power of making their own arrangements to secure efficient medical treatment and transferred this power to the local health committee, they began to manifest a feeling of hostility toward the bill and of distrust towards its framer. They saw themselves with their traditions of self-government, mutual help, and social intercourse in unequal competition with the insurance companies' sick clubs, in no sense democratic but governed by the company officials; and they saw their whole medical system passing out of their hands into those of the doctors and the health committees. The additional money advantage to their members did not balance the danger to their social and democratic traditions. At a special convention of the National Conference of Friendly Societies, they formulated a series of minimum demands and sent an ultimatum to the chancellor to the effect that unless their demands were granted they would repudiate the bill and refuse the administration of the act. Among these demands, the restitution of their control over the medical treatment of their members occupies the most prominent place; and on this issue—"the free choice of a doctor"—the battle was concentrated for several months. So much for the Friendly Societies' side.

In transferring the administration of medical benefit from the approved society to local health committees, Parliament expressed its belief in the principle of individual choice of a doctor. It decided that, in the interest of the individual member who may become ill, from considerations of efficient and economical administration and general health, it is desirable that the whole question of medical benefit should be turned over to local health committees. The latter will maintain an approved local list of doctors whom the local contributors may freely choose instead of being forced to use the "club" doctor employed on contract by

the friendly society or pay, in addition to their dues, for a physician of their own choice. The class of "soft" doctors, who are willing to give certificates to malingerers and cause the depletion of the society treasury, can be held in check, the adherents of this plan maintain, by their own profession, which will protect itself and the scheme by organizing watch committees. The daily experience of club treatment shows that the members often do not take advantage of the right to the attendance of the club doctor, but prefer to pay for a doctor of their own choice.

The doctors' side of the question remains to be considered. Doctors have hitherto accepted contract practice, with friendly and other societies, partly in order to get a start in life, partly to obtain experience, and often because, although in good practice, they were willing to do the work from altruistic motives. In many places, indeed, there has been no "doctor difficulty," the friendly societies treating the doctors reasonably and considerately. But under a scheme nation-wide in application the doctors were faced with the proposition that an engrossing share of their practice would become contract practice at a rate of pay which they held would be unremunerative. If the greater part of a physician's practice was to be turned into club practice, they claimed that a much higher rate per head would have to be charged. The chancellor agreed to fix this rate at 6s. per capita, without the medicine, as against the 5s., 4s., and even 3s. contract doctors have been accustomed to receive from friendly societies.

The final question at issue between doctors and friendly societies was the control of the local health committees, and to their demand for a majority on these bodies the societies were determined not to yield. In this fight the Opposition, the Conservative party, took the part of the societies. Afraid, to the minds of the Liberals, to attack the bill openly, and at the same time fully conscious of the fact that, if passed, it would establish a monument to the present Government, the Conservatives deemed this the proper moment to retard the progress of the bill. "Willing

to wound, but afraid to strike," they, in the words of Lloyd George, "gave a yap and then said to friendly societies and trade unions, 'You go at it.'" Their press recorded painstakingly the slightest manifestations of dissatisfaction—"revolt," they called it—from friendly society, labor man, socialist, suffragette, hospital officer, or private individual. They dwelt upon the unpopularity of the bill, the complexity of the situation, the inadequacy and unripeness of the bill, and finally went so far as to urge its withdrawal. Disappointed that the old-age pension bill stood to the credit of the Liberal government, they sought to block further social legislation by the party in power. For a time, this taking the bill into politics seriously endangered it, but gradually the situation cleared. The election results in Kilmarnock, where the campaign was conducted and won on the issue of the insurance bill, brought some relief and encouragement in Government circles, as did the effect on the public of Lloyd George's speech on the bill at Whitefield's Tabernacle on October 14. In this address Mr. Lloyd George presented the strong features of the bill, revealed the intrigues and the misrepresentations of the Opposition, and carried with him the audience and the general public by the declaration, "I will fight through or fall." To clinch this victory there appeared at this time a Report on Trade Unions Under the Scheme, prepared by an actuary of national standing, on behalf of organized labor, which pointed out, to the surprise of the labor unions themselves, that they would derive great advantages from the act. Soon after Ramsay MacDonald, M. P., chairman of the Labor party, made a public statement to the effect that the Labor party had passed a resolution in support of the insurance bill. He promised that all his influence would be used to aid its passage and stated that opinions contrary to the bill were held by but two or three members of the party. In the meantime the chancellor was using his influence to bring the two chief conflicting interests to terms. He brought the friendly societies to the point of attending joint meetings with representatives of the medical

profession, at which both sides made some concessions. On October 19 a great meeting of all friendly societies was held, at which the leaders surprised the audience by announcing that the chancellor of the exchequer had conceded nine out of their original eleven demands, and by moving a resolution in support of the bill, which was carried. The important concessions were: the right of investing their own funds; the right of self-government for the sick clubs of insurance companies; and, most important of all, the right to appoint the majority of representatives on local health committees. The acceptance of the amended bill by the societies was followed by the election of committees made up of doctors and society men to work out a *modus vivendi*. It is generally believed that the doctors, whose points as to larger fees and free choice have already been met, will soon be brought fully into line. With the heaviest opposition thus satisfied, all things point to the prospect that within a matter of weeks the bill will become law. Early the past month forty-two out of seventy clauses of the bill—and these the most important ones—had been voted on affirmatively in the House of Commons. The law once passed, England like Germany will possess a complete system of workingmen's insurance, so indispensable under present industrial conditions for the preservation of the workman's efficiency, the maintenance of his family, and the preservation of the nation of which he is an integral part. The full realization of the national aspect, of the constructive importance of the measure, the firm belief that it is intended for the common good, sounded through all deliberation and struggle. It was heard unmistakably by all classes of the population. Whether simple friendly society man or scientists of the medical profession, whether wage-earners or captains of industry, all have been made finally to understand that the Insurance Bill is a great measure in consideration of which selfish interest must be swept aside. In another case, that virility of the Englishman which seems to be his distinguishing asset has again come to a clear expression.

THE LODGING HOUSE

W. P. ENGLAND

FIELD SECRETARY YOUNG MEN'S CHRISTIAN ASSOCIATION, CHICAGO

There is a tale of tragedy in Dollman's great picture *Am I my Brother's Keeper?* which represents a scene on the Thames embankment, London. Three figures seated at one end of a bench are those of unskilled workers without money or occupation. A fourth figure is that of a discharged soldier with a war medal on his breast which he refuses to pawn even in the face of a bitter winter night outdoors. At the other end of the bench is a man from the country, with his wife and child, who has wandered into the city in fruitless search of work.

The scene makes a tremendous appeal to human sympathy. These people are asleep with no place to lay their heads and no covering save heaven's blue dome. But from the standpoint of health their lot is not so bad as that of the men and boys who with a few cents to spend put up in the close, disease-breeding lodging houses which are permitted to sell a vermin-laden hospitality in many of our great cities.

In every large city of the country thousands find nightly shelter in cheap lodging houses. To judge by investigations carried out under the direction of Abraham Bowers, immigration secretary of the Young Men's Christian Association of Chicago, 80 per cent of these houses no man can enter and be reasonably sure of leaving without being first infected with any of a dozen loathsome diseases or infected with itchy vermin. The sanitary and ventilating conditions in more than half of the Chicago lodging houses were

found to be not only deplorable but criminal. In most of them no laundry accommodations are furnished to the men and in many of them there are no baths. Common towels and a single drinking cup for an entire floor accommodating perhaps a hundred men, lack of cuspidors and often of brooms are a few of the items which go to make up a poor man's hell on earth. In one lodging house which embodies all these features, and many more, I found a ladder leading to an attic directly under the roof, scarcely four feet in height, and with little floor other than roof boards thrown across the joists which supported the ceiling of the room below. The attic had practically no ventilation and showed no signs of having been cleaned since the building was erected. What was it used for? Five senses answered the question. This was a parlor bed-room

"CELLS."

In this type sheets are changed once a week, the other bedding never. The whole is alive with vermin.

ON THE JOB.

In appearance these college-bred investigators were undistinguishable from the riff-raff in whose beds they slept.

for noisy drunks, poor men in the last stages of most horrible disease, and of old fellows so infested with vermin that even the most hardened lodger will have none of them. Not only was the air in this place the foulest, but every inch of the surface was overlaid with contaminating matter. One wishes for the pen of a Dickens or a Hugo to set out in words of burning insistence the necessity of providing some means whereby men may escape the paths which lead to these surroundings.

The Chicago investigation was carried out on a more comprehensive scale than any inquiry of recent years into lodging

house conditions. As a result of its findings gifts have been made toward an association hotel for homeless men as one step in a plan for improvement. The inquiry was carried out last March during the high-tide of the drift of casual laborers to the city. After the general plan was mapped out a meeting was held, at which a number of housing experts made suggestions.

Investigators were drawn to some extent from university men enjoying their spring vacations. A majority of the nineteen men chosen had had experience in investigations of a similar nature. They were sent out in pairs, each pair to lodge two nights in the same hotel. Each man was equipped with a large bed sheet, nine feet in length, in which to wrap himself against vermin and disease; a steel tape for computing the cubic feet of air space per lodger, and the sizes of the windows and doors for light, ventilation, blind hallways, and fire-escapes; cameras and flash-light material for interior photographs; and two kinds of questionnaires. The investigators found it difficult, either singly or in pairs, to get good photographs, but after the visits had been completed six men

formed a camera party and with the authority of the health department made forcible entry into a number of hotels and secured pictures which give a permanent graphic record of the conditions described.

Of the sixty hotels investigated, thirty-one were on the south side in a narrow district two blocks wide and five blocks long, between Van Buren and Polk streets and extending from Wabash avenue to the river; twenty-seven on the west side were confined to seven blocks, between the river and Halsted street; the other two were on the north side near the river.

The entire number had a capacity of 14,689 men in night service alone and the majority of them had day lodgers in addition. At the time of the investigation, 14,048 were found in the buildings. Including those who were known to be stopping at these houses but who could not be counted, day lodgers, those lodging at the municipal lodging house, and at those other places in the lodging house district not investigated, it was estimated that from 20,000 to 25,000 homeless men were housed at the time in the first and eighteenth wards.

These houses fall into several groups, according to the type of manager, nature of equipment, rate charged, and location. These determine the kind of patronage attracted. First, there is the most common type, called the "cell" or "stall" house, in which the rates range from ten to twenty-five cents. This type has three or four floor being a single room running the length of the building, and being divided into cells, the walls of which rise to within three feet of the ceiling and are generally made of corrugated iron sheathing—sometimes wood. There are ninety to two hundred cells on each floor. Over the top of each cell is a wire netting. The equipment consists of an iron bed two and one-half by six feet, with wire woven springs, upon which is a straw mattress and the usual coverings.

It was found that in this type the sheets were changed once a week, the other bedding never. The pillows, made of feathers and covered with a dark and greasy case, were often as heavy as lead and harder than the mattresses. The whole outfit was usually covered with a filthy dust from the dry sweepings and was alive with vermin. In almost every house of the "cell" type lavatory facilities existed on each floor but were confined to a single room. From the urinals, much of the time out of repair and seldom

ii ever clean, and the unpainted, soft wood flooring, arose odors which added to the contamination of the air in the sleeping cells. Disinfectants and fumigation are seldom used in these buildings. The lavatory equipment usually consisted of two or three wash-bowls, a roller towel to each bowl, one or two closets and a urinal. Quite often there was no soap. The two or three towels were used by all the men on a floor, which meant fifty or one hundred men to a towel. Venereal diseases and tuberculosis are so common among the transient laborers, professional criminals, and beggars living in these houses that

TO KEEP OFF VERMIN.
This device was resorted to by most of the investigators. The lodgers didn't use it.

it seems impossible that young men and boys thrown into their company for the first time can be safe.

The second type of lodging house is what is commonly called the "flop." This is the lowest form of herding men together. One visited was in a basement. The floor was covered with boards laid any way; the men slept on the floor with no protection whatsoever except a newspaper, paying five cents for the privilege. In some cases a coat was used for a pillow and an overcoat for covers. Newspapers were used as towels. At times the place is crowded and the men are arranged in rows upon the floor with no space between them, so that often one rolls over on another. The price paid for such quarters is five cents, and they are patronized regularly only by the lowest class of lodgers, most of whom, in the opinion of the investigators, never work and do not want to work—men who live by begging and pilfering.

A third type of lodging house is the degraded rooming house. The old rooms are often divided into "cells" with practically the same equipment as the "cell" lodging house. Rooms were found also which were not divided, and these contained a large number of beds arranged in rows. The price of such sleeping quarters, as in the stall houses, ranges from ten to twenty-five cents.

There are three sorts of these "rooming" houses: first, the respectable class, where a transient may obtain a fairly good night's lodging at small cost; second, houses of ill repute, where only quarters for disreputable purposes can be obtained; and lastly, the combination type, where a night's lodging can be obtained as a transient, but no objection is made to assignation if the privilege is paid for. Their mixed character makes them all the more insidious dangers to young men, unacquainted with the city, who may put up at them. The signs on the streets leading to these places are often misleading, and many a transient girl falls into them.

Taken as a whole, the lodgers in all these houses comprise the bulk of the floating population of a big city and include a large part of our social para-

sites. There is a great lack of ambition and foresight among them. Many never know where their "banner" is coming from for the next night. "Banner" is the slang expression for the money necessary for lodging. Peculation and theft are every-day occurrences. Most are casual workers. Some work on the railroads and lakes in the summer and loaf at these cheap lodging houses during the winter, living on the earnings saved during the season. Large numbers are irregularly employed, working at odd jobs, such as distributing bills, carrying signs, washing dishes. Some work for a week and rest for a week, not caring for steady employment. The professional beggar and professional criminal also have their headquarters at these places. The criminal, unlike the professional beggar, who is crippled or defective in some way, is generally a little better dressed than the ordinary lodger and is more alert. The young fellow who has had trouble at home; the boy who wants to see the world; the business man who has failed in middle age and lost out; the tramp; the criminal—all find place in the ranks.

All of the investigators agreed in the judgment that 27 per cent of the lodgers they met were under twenty-five years of age. In their estimate, over 1,000 boys under twenty-one years of age come into this cheap hotel life in Chicago every year. Two cases will illustrate the wide extremes to be found among the men in lodging houses. One, born of old Vermont stock, worked on his father's farm until twenty years of age. Then he went to a college of engineering, and after graduating got a job as fireman. He railroaded for some time, until one day he found that he could better his condition by working in the engineering department of a packing company in Oklahoma. Recently he had been transferred to the Chicago plant of the same company and was planning to take the Young Men's Christian Association course in electricity. He was good-looking, clean-shaven, wore clean clothes—old, but neat. His wages were about twelve dollars per week. He spent his leisure in reading good literature. He lived in

this lodging house temporarily in order to save money.

The other man, within six months of the same age, came of German-American stock, was born in New York city, and went through seven grades of the public schools. After learning the painting and decorating trade, he ran away and enlisted in the navy. He had been out of work for some time, was dirty and down at the heels. His habits were all that they should *not* be. Often he had not enough money for a bed, and bunked on a floor or in a rear door-way.

There is little public opinion among the lodgers. Each man is for himself. No questions are asked of him, and he asks none. In all the places visited there was not much conversation and no companionship of any form. The majority of lodgers spend their leisure moments in the lounging rooms, smoking and letting their thoughts wander. Occasionally a habitué will offer a bit of sound advice to a newcomer into the life.

"Get right out of this," said an old man to the writer. "It is no place for you. Be ambitious—make something of yourself. You are young and can make a success out of life."

Few of the men talked with had gone beyond the lowest grades in the public schools. The newspaper is the common source of knowledge. It is invariably the sensational paper. In none of the places visited was card-playing allowed; but at one place the management furnished dominoes and checkers, and the boards were sought after eagerly, showing the craving for wholesome recreation otherwise unmet.

A striking and important thing to know about the average lodger is that he has no family life, no ties whatsoever to give stability to his scheme of existence. No little child places its arms around his neck. He lives for himself. The lodging houses are generally found adjoining or near the red light district. Saloons line the streets, and many have free burlesque shows in connection where lewd women dance and drink with the men. Immorality is invariably the topic of conversation among lodgers. One young fellow of

twenty-one could not speak a sentence without using its vernacular. Throughout the district investigated quack doctors abound, often connected with free museums of anatomy where the wax exhibits are calculated to frighten visitors into their clutches. The attendant gives to each man entering a memorandum book, recounting symptoms such as will play on the imagination of young men, ignorant of the ways of adolescence, until they think they are diseased.

In devising methods for raising the level of lodging house conditions in the interest of the lodger and the community, the landlord is the natural leverage through which the public can act by compulsion and cooperation. But, in doing so, his difficulties and interests must not be ignored. The landlord's equipment is generally cheap and old and under severe treatment on account of the sort of tenants to whom he caters. His also is somewhat a seasonal business. The winter is his harvest; in summer many of his patrons sleep outdoors and others are working on the lakes and in the construction camps.

The community has the right to demand from the landlord a fixed minimum amount of cleanliness, sanitation, toilet facilities, and air space per lodger. There are all kinds of landlords, just as there are all kinds of lodgers. All are in it for the money, but many take pride in keeping their places in good repair. Such are satisfied with a fair return on their investment. Others are exploiters who make no repairs except under compulsion and care little whether lodgers suffer inconvenience or sanitary evils.

The necessity for action that will eliminate such houses as, through public neglect and private greed, have become sink holes in the community life concerns more than the men who are bogged in them. For the lodging house opens up a complex of problems. It is bound up with many other evils of the day. Its influence is far-reaching and at present the net result of that influence is undermining to society at large. The lodging house, left to itself, is breeding vice, crime, poverty, sickness, and death.

IN THE HANDS OF A RECEIVER

SAMUEL McCHORD CROTHERS

[Reprinted from the *Atlantic Monthly*.]

It sometimes happens that a business man who is in reality solvent becomes temporarily embarrassed. His assets are greater than his liabilities, but they are not quick enough to meet the situation. The liabilities have become mutinous and bear down upon him in a threatening mob. If he had time to deal with them one by one, all would be well; but he cannot on the instant mobilize his forces.

Under such circumstances the law allows him to surrender, not to the mob, but to a friendly power which shall protect the interests of all concerned. He goes into the hands of a receiver, who will straighten out his affairs for him. I can imagine the relief which would come to one who could thus get rid, for a while, of his harassing responsibilities, and let some one else do the worrying.

In these days some of the best people I know are in this predicament in regard to their moral and social affairs. These friends of mine have this peculiarity, that they are anxious to do their duty. Now, in all generations, there have been persons who did their duty, according to their lights. But in these days it happens that a new set of lights has been turned on suddenly, and we all see more duties than we had bargained for. In the glare we see an army of creditors, each with an overdue bill in hand. Each demands immediate payment, and shakes his head when we suggest that he call again next week. We realize that our moral cash in hand is not sufficient for the crisis. If all our obligations must be met at once, there will be a panic in which most of our securities will be sacrificed.

We are accustomed to grumble over the increase in the cost of living. But the enhancement of price in the necessities of physical life is nothing compared to the increase in the cost of the higher life.

There are those now living who can

Copyright 1911 by the Atlantic Monthly Company and reprinted from the August number through the courtesy of editors and author.

remember when almost any one could have the satisfaction of being considered a good citizen and neighbor. All one had to do was to attend to one's own affairs and keep within the law. He would then be respected by all, and would deserve the most eulogistic epitaph when he came to die. By working for private profit he could have the satisfaction of knowing that all sorts of public benefits came as by-products of his activity.

But now all such satisfactions are denied. To be a good citizen you must put your mind on the job, and it is no easy one. You must be up and doing. And when you are doing one good thing there will be keen-eyed critics who will ask why you have not been doing other things which are much more important; and they will sternly demand of you, "What do you mean by such criminal negligence?"

What we call the awakening of the social conscience marks an important step in progress. But, like all progress, it involves hardship to individuals. For the higher moral classes, the saints and the reformers, it is the occasion of whole-hearted rejoicing. It is just what they have, all the while, been trying to bring about. But I confess to a sympathy for the middle class, morally considered, the plain people, who feel the pinch. They have invested their little all in the old-fashioned securities, and when these are depreciated they feel that there is nothing to keep the wolf from the door. After reading a few searching articles in the magazines they feel that, so far from being excellent citizens, they are little better than enemies of society. I am not pleading for the predatory rich, but only for the well-meaning persons in moderately comfortable circumstances, whose predatoriness has been suddenly revealed to them.

Many of the most conscientious persons go about with an habitually apologetic manner. They are rapidly acquiring the evasive air of the conscious

criminal. It is only a very hardened philanthropist, or an unsophisticated beginner in good works, who can look a sociologist in the eye. Most persons, when they do one thing, begin to apologize for not doing something else. They are like a one-track railroad that has been congested with traffic. They are not sure which train has the right of way, and which should go on the siding. Progress is a series of rear-end collisions.

There is little opportunity for self-satisfaction. The old-fashioned private virtues which used to be exhibited with such innocent pride as family heirlooms are now scrutinized with suspicion. They are subjected to rigid tests to determine their value as public utilities.

Perhaps I may best illustrate the need of some receivership by drawing attention to the case of my friend the Reverend Augustus Bagster.

Bagster is not by nature a spiritual genius; he is only a modern man who is sincerely desirous of doing what is expected of him. I do not think that he is capable of inventing a duty, but he is morally impressionable, and recognizes one when it is pointed out to him. A generation ago such a man would have lived a useful and untroubled life in a round of parish duties. He would have been placidly contented with himself and his achievements. But when he came to a city pulpit he heard the Call of the Modern. The multitudinous life around him must be translated into immediate action. His conscience was not merely awakened: it soon reached a state of persistent insomnia.

When he told me that he had preached a sermon on the text, "Let him that stole steal no more," I was interested. But shortly after, he told me that he could not let go of that text. It was a live wire. He had expanded the sermon into a course on the different kinds of stealing. He found few things that did not come under the category of Theft. Spiritual goods as well as material might be stolen. If a person possessed a cheerful disposition, you should ask, "How did he get it?"

"It seems to me," I said, "that a cheerful disposition is one of the things where

possession is nine-tenths of the law. I don't like to think of such spiritual wealth as ill-gotten."

"I am sorry," said Bagster, "to see that your sympathies are with the privileged classes."

Several weeks ago I received a letter which revealed his state of mind:—

"I believe that you are acquainted with the Editor of the *Atlantic Monthly*. I suppose he means well, but persons in his situation are likely to cater to mere literature. I hope that I am not uncharitable, but I have a suspicion that our poets yield sometimes to the desire to please. They are perhaps unconscious of the subtle temptation. They are not sufficiently direct and specific in their charges. I have been reading Walt Whitman's *Song of Joys*. The subject does not attract me, but I like the way in which it is treated. There is no beating around the bush. The poet is perfectly fearless, and will not let any guilty man escape.

O the farmer's joys!

Ohioans, Illinoisans, Wisconsinese, Kansadians, Iowans, Kansans, Oregonese joys.

"That is the way one should write if he expects to get results. He should point to each individual and say, 'Thou art the man.'

"I am no poet,—though I am painfully conscious that I ought to be one,—but I have written what I call the *Song of Obligations*. I think it may arouse the public. In such matters we ought to unite as good citizens. You might perhaps drop a postal card, just to show where you stand."

THE SONG OF OBLIGATIONS.

O the citizen's obligations.

The obligation of every American citizen to see that every other American citizen does his duty, and to be quick about it.

The janitor's duties, the Board of Health's duties, the milkman's duties, resting upon each one of us individually with the accumulated weight of every cubic foot of vitiated air, and multiplied by the number of bacteria in every cubic centimeter of milk.

The motorman's duties, and the duty of every spry citizen not to allow himself to be run over by the motorman.

- The obligation of teachers in the public schools to supply their pupils with all the aptitudes and graces formerly supposed to be the result of heredity and environment.
- The duty of each teacher to consult daily a card catalogue of duties, beginning with Apperception and Adenoids and going on to Vaccination, Ventilation, and the various vivacious variations on the three R's.
- The obligation resting upon the well-to-do citizen not to leave for his country place, but to remain in the city in order to give the force of his example, in his own ward, to a safe and sane Fourth of July.
- The obligation resting upon every citizen to write to his Congressman.
- The obligation to speak to one's neighbor who may think he is living a moral life, and who yet has never written to his Congressman.
- The obligation to attend hearings at the State House.
- The obligation to protest against the habit of employes at the State House of professing ignorance of the location of the committee-room where the hearings are to be held; also to protest against the habit of postponing the hearings after one has at great personal inconvenience come to the State House in order to protest.
- The duty of doing your Christmas shopping early enough in July to allow the shop-girls to enjoy their summer vacation.
- The duty of knowing what you are talking about, and of talking about all the things you ought to know about.
- The obligation of feeling that it is a joy and a privilege to live in a country where eternal vigilance is the price of liberty, and where even if you have the price you don't get all the liberty you pay for.

I was a little troubled over this effusion, as it seemed to indicate that Bagster had reached the limit of elasticity. A few days later I received a letter asking me to call upon him. I found him in a state of uncertainty over his own condition.

"I want you," he said, "to listen to the report my stenographer has handed me, of an address which I gave day before yesterday. I have been doing some of my most faithful work recently; going from one meeting to another and helping in every good cause. But at this meeting I had a rare sensation of freedom of utterance. I had the sense of liberation from the trammels of time and space. It was a realization of moral

ubiquity. All the audiences I had been addressing seemed to flow together into one audience, and all the good causes into one good cause. Incidentally I seemed to have solved the Social Question. But now that I have the stenographic report I am not so certain."

"Read it," I said.

He began to read, but the confidence of his pulpit tone, which was one of the secrets of his power, would now and then desert him, and he would look up to me as if waiting for an encouraging "Amen."

"Your secretary, when she called me up by telephone, explained to me the object of your meeting. It is an object with which I deeply sympathize. It is Rest. You stand for the idea of poise and tranquility of spirit. You would have a place for tranquil meditation. The thought I would bring to you this afternoon is this: We are here not to be doing, but to be.

"But of course the thought at once occurs to us, How can we be considering the high cost of the necessaries of life? It will be seen at once that the question is at bottom an economic one. You must have a living wage, and how can there be a living wage unless we admit the principle of collective bargaining? It is because I believe in the principle of collective bargaining that I have come here to-night to say to you workmen that I believe this strike is justifiable.

"I must leave to other speakers many interesting aspects of this subject, and confine myself to the aspect which the committee asked me to consider more in detail, namely, Juvenile Delinquency in its relation to Foreign Immigration. The relation is a real one. Statistics prove that among immigrants the proportion of the juvenile element is greater than among the native-born. The increase in juvenility gives opportunity for juvenile delinquency from which many of our American communities might otherwise be free. But is the remedy to be found in the restriction of immigration? My opinion is that the remedy is to be found only in education.

"It is our interest in education that has brought us together on this bright

June morning. Your teacher tells me that this is the largest class that has ever graduated from this high school. You may well be proud. Make your education practical. Learn to concentrate, that is the secret of success. There are those who will tell you to concentrate on a single point. I would go even further. Concentrate on every point.

"I admit, as the gentleman who has preceded me has pointed out, that concentration in cities is a great evil. It is an evil that should be counteracted. As I was saying last evening to the Colonial Dames,—Washington, if he had done nothing else, would be remembered today as the founder of the Order of the Cincinnati. The figure of Cincinnati at the plough appeals powerfully to American manhood. Many a time in after years Cincinnati wished that he had never left that plough. Often amid the din of battle he heard the voice saying to him, 'Back to the Land!'

"It was the same voice I seemed to hear when I received the letter of your secretary asking me to address this grange. As I left the smoke of the city behind me and looked up at your granite hills, I said, 'Here is where they make men!' As I have been partaking of the bountiful repast prepared by the ladies of the grange, your chairman has been telling me something about this community. It is a grand community to live in. Here are no swollen fortunes; here industry, frugality, and temperance reign. These are the qualities which have given New England its great place in the councils of the nation. I know there are those who say that it is the tariff that has given it that place; but they do not know New England. There are those at this table who can remember the time when eighty-two ruddy-cheeked boys and girls trooped merrily to the little red school-house under the hill. In the light of such facts as these, who can be a pessimist?

"But I must not dwell upon the past; the Boy Scouts of America prepare for the future. I am reminded that I am not at this moment addressing the Boy Scouts of America—they come to-morrow at the same hour—but the principle is the same. Even as the Boy Scouts of

America look only at the future, so do you. We must not linger fondly on the days when cows grazed on Boston Common. The purpose of this society is to save Boston Common. That the Common has been saved many times before is true; but is that any reason why we should falter now? 'New occasions teach new duties.' Let us not be satisfied with a superficial view. While fresh loam is being scattered on the surface, commercial interests and the suburban greed to get home quick are striking at the vitals of the Common. Citizens of Boston, awake!

"Your pastor had expected to be with you this evening, but he has at the last moment discovered that he has two other engagements, each of them of long standing. He has therefore asked me to take his place in this interesting course of lectures on Church History. The subject of the lecture for this evening is—and if I am mistaken some one will please correct me—Ulphilas, or Christianity among the Goths. I cannot treat this subject from that wealth of historical information possessed by your pastor; but I can at least speak from the heart. I feel that it is well for us to turn aside from the questions of the day, for the quiet consideration of such a character as Ulphilas.

"Ulphilas seems to me to be one of those characters we ought all to know more about. I shall not weary you by discussing the theology of Ulphilas or the details of his career. It would seem more fitting that these things should be left for another occasion. I shall proceed at once to the main lesson of his life. As briefly as possible let me state the historical situation that confronted him. It is immaterial for us to inquire where the Goths were at that time, or what they were doing. It is sufficient for us to know that the Goths at that time were pagans, mere heathen. Under those circumstances what did Ulphilas do? He went to the Goths. That one act reveals his character. If in the remaining moments of this lecture I can enforce the lesson for us of that one act, I shall feel that my coming here has not been in vain.

"But some one who has followed my argument thus far may say, 'All that you have said is true, lamentably true; but what has it to do with the Advancement of Woman?' I answer, it is the Advancement of Woman."

"How do you make that out?" I asked.

Bagster looked vaguely troubled. "There is no such thing as an isolated moral phenomenon," he said, as if he were repeating something from a former sermon. "When you attempt to remedy one evil you find it related to a whole moral series. But perhaps I did not make the connection plain. My address doesn't seem to be as closely reasoned as it did when I was delivering it. Does it seem to you to be cogent?"

"Cogent is not precisely the word I would use. But it seems earnest."

"Thank you," said Bagster. "I always try to be earnest. It's hard to be earnest about so many things. I am always afraid that I may not give to all an equal emphasis."

"And now that you have stopped for a moment," I suggested, "perhaps you would be willing to skip to the last page. When I read a story I am always anxious to get to the end. I should like to know how your address comes out,—if it does come out."

Bagster turned over a dozen pages and read in a more animated manner.

"Your chairman has the reputation of making the meetings over which he presides brisk and crisp. He has given me just a minute and a half in which to tell what the country expects of this Federation of Young People. I shall not take all the time. I ask you to remember two letters—E and N. *What* does the country expect this Federation to do? E—everything. *When* does the country expect you to do it? N—now. Remember these two letters—E and N. Young people, I thank you for your attention.

"The hour is late. You, my young brother, have listened to a charge in which your urgent duties have been fearlessly declared to you. When you have performed these duties, others will be presented to you. And now, in token

of our confidence in you, I give you the right hand of fellowship.

"—And do you know," said Bagster, "that when I reached to give him the right hand of fellowship, he wasn't there?"

We sat in silence for some time. At last he asked, hesitatingly, "What do you think of it? In your judgment is it organic or functional?"

"I do not think it is organic. I am afraid that your conscience has been over-functioning of late, and needs a rest. I know a nook in the woods of New Hampshire, under the shadow of Mount Chocorua, where you might go for six months while your affairs are in the hands of a receiver. I can't say that you would find everything satisfactory, even there. The mountain is not what it used to be. It is decadent, geologically speaking, and it suffered a good deal during the last glacial period. But you can't do much about it in six months. You might take it just as it is,—some things have to be taken that way.

"You will start to-morrow morning and begin your life of temporary irresponsibility. You will have to give up your problems for six months, but you may rest assured that they will keep. You will go by Portsmouth, where you will have ten minutes for lunch. Take that occasion for a leisurely meal. A card will be handed to you assuring you that 'The bell will ring one minute before the departure of the train. You can't get left.' Hold that thought: you can't get left; the railroad authorities say so."

"Did you every try it?" asked Bagster.

"Once," I answered.

"And did you get left?"

"Portsmouth," I said, "is a beautiful old town. I had always wanted to see it. You can see a good deal of Portsmouth in an afternoon."

The predicament in which my friend Bagster finds himself is a very common one. It is no longer true that the good die young; they become prematurely middle-aged. In these days conscience doth make neurasthenics of us all. Now it will not do to flout conscience, and by shutting our eyes to the urgencies

and complexities of life purchase for ourselves a selfish calm. Neither do we like the idea of neurasthenia.

My motion is that the twentieth-century man is morally solvent, though he is temporarily embarrassed. He will find himself if he is given sufficient time. In the mean time it is well for him to consider the nature of his embarrassment. He has discovered that the world is "so full of a number of things," and he is disappointed that he is not as "happy as kings"—that is, as kings in the fairy books. Perhaps "sure enough" kings are not as happy as the fairy-book royalties, and perhaps the modern man is only experiencing the anxieties that belong to his new sovereignty over the world.

There are tribes which become confused when they try to keep in mind more than three or four numbers. It is the same kind of confusion which comes when we try to look out for more than Number One. We mean well, but we have not the facilities for doing it easily. In fact, we are not so civilized as we sometimes think.

For example, we have never carried out to its full extent the most important invention that mankind has ever made—money. Money is a device for simplifying life by providing a means of measuring our desires, and gratifying a number of them without confusion.

Money is a measure, not of commodities, but of states of mind. The man on the street expresses a profound philosophy when he says, "I feel like thirty cents." That is all that "thirty cents" means. It is a certain amount of feeling.

You see an article marked \$1.50. You pass by unmoved. The next day you see it on the bargain counter marked 98 cents, and you say, "Come to my arms," and carry it home. You did not feel like a dollar and a half toward it, but you did feel exactly like ninety-eight cents.

It is because of this wonderful measure of value that we are able to deal with a multitude of diverse articles without mental confusion.

I am asked to stop at the department store and discover in that vast aggregation of goods a skein of silk of a speci-

fied shade, and having found it bring it safely home. Now, I am not fitted for such an adventure. Left to my own devices I should be helpless.

But the way is made easy for me. The floor-walker meets me graciously, and without chiding me for not buying the things I do not want, directs me to the one thing which would gratify my modest desire. I find myself in a little place devoted to silk thread, and with no other articles to molest me or make me afraid. The world of commodities is simplified to fit my understanding. I feel all the gratitude of the shorn lamb for the tempered wind.

At the silken shrine stands a Minerva who imparts her wisdom and guides my choice. The silk thread she tells me is equivalent to five cents. Now, I have not five cents but only a five-dollar bill. She does not act on the principle of taking all that the traffic will bear. She sends the five-dollar bill through space, and in a minute or two she gives me the skein and four dollars and ninety-five cents, and I go out of the store a free man. I have no misgivings and no remorse because I did not buy all the things I might have bought. No one reproached me because I did not buy a four-hundred-dollar pianola. Thanks to the great invention, the transaction was complete in itself. Five cents represented one choice, and I had in my pocket ninety-nine choices which I might reserve for other occasions.

But there are some things which, as we say, money cannot buy. In all these things of the higher life we have no recognized medium of exchange. We are still in the stage of primitive barter. We must bring all our moral goods with us, and every transaction involves endless dickering. If we express an appreciation for one good thing, we are at once reproached by all the traffickers in similar articles for not taking over bodily their whole stock-in-trade.

For example, you have a desire for culture. You haven't the means to indulge in very much, but you would like a little. You are immediately beset by all the eager Matthew Arnolds who have heard of your desire, and they insist that you should at once devote your-

self to the knowledge of the best that has been known and said in the world. All this is very fine, but you don't see how you can afford it. Isn't there a little of a cheaper quality that they could show you? Perhaps the second best would serve your purpose. At once you are covered with reproaches for your philistinism.

You had been living a rather prosaic life and would like to brighten it up with a little poetry. What you would really like would be a modest James Whitcomb Riley's worth of poetry. But the moment you express the desire the University Extension lecturer insists that what you should take is a course of lectures on Dante. No wonder that you conclude that a person in your circumstances will have to go without any poetry at all.

It is the same way with efforts at social righteousness. You find it difficult to engage in one transaction without being involved in others that you are not ready for. You are interested in a social reform that involves collective action. At once you are told that it is socialistic. You do not feel that it is any worse for that, and you are quite willing to go on. But at once your socialistic friends present you with the whole programme of their party. It is all or nothing. When it is presented in that way you are likely to become discouraged and fall back on nothing.

Now, if we had a circulating medium you would express the exact state of your desires somewhat in this way: "Here is my moral dollar. I think I will take a quarter's worth of Socialism, and twelve and a half cents' worth of old-time Republicanism, and twelve and a half cents of genuine Jeffersonian democracy, if there is any left, and a quarter's worth of miscellaneous insurgency. Let me see, I have a quarter left. Perhaps I may drop in to-morrow and see if you have anything more that I want."

The sad state of my good friend Bagster arises from the fact that he can't do one good thing without being confused by a dozen other things which are equally good. He feels that he is a mis-

erable sinner because his moral dollar is not enough to pay the national debt.

But though we have not yet been able adequately to extend the notion of money to the affairs of the higher life, there have been those who have worked on the problem.

That was what Socrates had in mind. The Sophists talked eloquently about the Good, the True, and the Beautiful; but they dealt in these things in the bulk. They had no way of dividing them into sizable pieces for every-day use. Socrates set up in Athens as a broker in ideas. He dealt on the curb. He measured one thing in terms of another, and tried to supply a sufficient amount of change for those who were not ashamed to engage in retail trade.

Socrates draws the attention of Phædrus to the fact that when we talk of iron and silver the same objects are present to our minds, "but when any one speaks of justice and goodness, there is every sort of disagreement, and we are at odds with one another and with ourselves."

What we need to do, he says, is to have an idea that is big enough to include all the particular actions or facts. Then, in order to do business, we must be able to divide this so that it may serve our convenience. This is what Socrates called Philosophy.

"I am a great lover," he said, "Of the processes of division and generalization; they help me to speak and think. And if I find any man who is able to see unity and plurality in nature, him I follow, and walk in his steps as if he were a god."

Even in the Forest of Arden life was not so simple as at first it seemed. The shepherd's life which "in respect of itself was a good life" was in other respects quite otherwise. Its unity seemed to break up into a confusing plurality. Honest Touchstone, in trying to reconcile the different points of view, blurted out the test question, "Hast any philosophy in thee, Shepherd?" After Bagster has communed with Chocorua for six months, I shall put that question to him.

The rare gifts and leadership of Josephine Shaw Lowell in the field of charitable and social advance are brought out in William Rhinelander Stewart's biography of Mrs. Lowell, reviewed in this number. P. 1342.

The School for Mayors is the sobriquet already given the school for civic science instituted by Mrs. Harriman in line with the desires of the great railroad builder. P. 1340.

Cincinnati was a veritable laboratory for the National Society for the Promotion of Industrial Education at its annual convention in November. P. 1328.

While other cities have been talking about it, Syracuse for six months has had a working team made up of representatives of the Chamber of Commerce, the Ministerial Association, the Associated Charities, and the Central Federated Union; it has carried out a quick social inventory and held a "Know your City" week. P. 1337.

In its decision on workmen's compensation, the Wisconsin Supreme Court applies what it calls the twentieth century attitude of mind to an eighteenth century constitution. P. 1327.

The campaign for a safe and sane Fourth has its counterpart in the efforts of the National Fire Protection Association to cut down fires due to Christmas trees, bunting, and lights. P. 1348.

Iowa, Florida, Minnesota, Missouri, Pennsylvania—five state conferences bring out current phases of charitable and correctional problems in different parts of the United States. Pp. 1333-1336.

On Monday of this week Judge William P. Martin of the Essex County Court of Common Pleas upheld the constitutionality of the New Jersey employers' liability law. The case will be appealed.

The pleas of "guilty" entered by the McNamaras throw into stark relief the fact that officials of a national group of organized labor, in an industrial field in which the contest between employers and employes has been sharpest, have resorted to dynamiting. In an interview, Harrison Gray Otis calls on organized labor to "purge its ranks of lawless methods, principles, purposes, and persons," and "act within the limitations of the law." Lincoln Steffens, who brought the trial to an end, turns the challenge around and asks, "What are we Americans going to do about conditions which are bringing up healthy, good-tempered boys like these McNamara boys really to believe, as they most sincerely do—they and a growing group of labor—that the only recourse they have for

improving the conditions of the wage-earner is to use dynamite against property and life?" The reported action of Los Angeles citizens, in considering the outcome a release from an unnatural tension and alignment in American life, and setting about to establish fresh and more hopeful industrial relationships, is a call upon the country for ways and means to go about it. A symposium bringing out the positive and constructive bearings of the situation will be published in an early SURVEY. Prof. Taylor promptly reviews the case in this issue. P. 1339.

BY THE EDITOR

PREJUDICES AGAINST ORGANIZED CHARITY

Denunciation of prejudice is easy, especially if the prejudice happen to be directed against yourself. Sympathetic understanding of the grounds of prejudice, especially if it be directed against yourself or against policies in which you believe, is much more profitable. Specific attacks upon particular societies or policies it may well be a clear duty to denounce and to repel with all possible energy. We are considering rather that receptive state of mind in any quarter which is often all that makes such attacks worthy of serious attention. That there has been this kind of latent hostility to organized charity in some quarters, giving an unnatural and exaggerated influence to criticisms and attacks which would otherwise be beneath contempt, is true enough.

Fortunately, various prejudices which are encountered are to a large extent mutually destructive, and to an even larger extent eventually self-destructive because of their inherent absurdity. If at the same time and in the same place progressives criticize organized charity as allied with privilege and reactionaries attack it as an instrument of social revolution, sober and sensible people are very apt to infer that there is probably not very much ground for either criticism, as in fact there is not. If superficial evolutionists suggest that organized charity is keeping alive the unfit, and on the other hand sentimentalists in the churches or in the essayist's or poet's study find it hard-hearted, statistical, unsympathetic, this again suggests that while both might conceivably be right, in fact both are probably wrong. Thus the instinctive antagonism of such different elements, so far from giving cumulative evidence that it is well founded, is evidence that a large part of it at least has no foundation at all except in a misconception which time and patience may be expected to remove.

The essential principles of organized charity are (1) painstaking inquiry into the facts so that assistance may be based upon knowledge, (2) co-operation on the basis of knowledge, whether this take the form of combined effort or division of work, (3) adequate, appropriate, persistent, and efficient action in individual cases, with a view primarily to the removal of the fundamental causes of dependence so far as they are personal, and (4) concerted attack upon the social causes of exploitation and hardship, such as unsanitary housing, child labor, extortionate charges by pawnshops, salary loan and chattel mortgage agencies, and uncompensated industrial injuries. We are not suggesting that all charity organization societies actually take part in all or even a large part of the movements which have for their aim the elimination of adverse social conditions. Their resources are limited and in a particular instance they may not be convinced of the wisdom or timeliness of plans which are enthusiastically advocated by others. But that there are social causes of dependence and degeneracy, and that it is a proper function of organized charity to lay bare these causes and to aid in removing them, is long since established beyond question.

The most persistent and mischievous of the criticisms of organized charity is based upon a popular misconception of its relation to material relief. Organized charity believes in relief and uses it—but only as a means to an end. The end is not the relief of distress, but getting rid of the need for it. Not the increase of the physical comfort of the poor but the increase of their strength is its goal. Not the relief of families in distress but family rehabilitation is the task which it sets for itself. Its visitors and volunteer workers are not engaged in “administering relief.” They are engaged in helping people to become able to do without relief. They are wrestling in a far more fundamental way than if they were almoners with the real difficulties which widows, deserted mothers, and the families of consumptives must solve if they are to make a success in spite of their handicap, if they are to give their children a fair chance notwithstanding their misfortunes. Those who pretend to think that poverty itself, *i. e.*, mere lack of income, is the only difficulty are as far astray as those, now happily for the most part silenced, who found the whole trouble to be some personal vice or weakness. The fact is that the troubles of the poor are not so simple as either their critics or their apologists would have us believe. They are complicated, involved, and varied. They do not reduce readily to simple formulae.

The Federal Court which is told to reorganize the Tobacco Trust has a simple task as compared with the problem that sometimes falls to the visitor in a family which is familiar with such disabilities as chronic illness, strong drink, overcrowding, and physical defects in the children. When after a year or two of the hardest kind of hard work in such a family, involving infinite patience and tact and ingenuity, involving co-operation with physicians, priests, and school teachers, involving the use of dispensaries, fresh air agencies, and a municipal department, involving perhaps an expenditure of fifty dollars besides what can be raised from employers or relatives and others who have a natural personal obligation in the matter, the situation is saved, the drunkard is put on his feet at least for the time being, the family is moved into a better and less crowded tenement, the sick patient is better cared for, and the children have their eyes and throats attended to—then, what happens? Why, then, some one in the legislature, or some anonymous critic through the mails or the press, repeats the old lie that it costs a hundred dollars to administer this fifty dollars of relief. This cost, when it is not pure fabrication, is calculated by adding up all that the society expends for any purpose whatever, even if it has not the remotest connection with relief. Organized charity cannot tell what it costs to administer relief because it has no agents or machinery engaged in that occupation. How can a school tell what it costs to administer the crayon and ink used in the education of pupils, or a doctor what it costs to administer his medicines, or an inventor what it costs to administer the supplies of his laboratories?

All these are incidents to the work in hand. Organized charity uses relief incidentally, precisely as the teacher, the physician, and the inventor use their supplies; but it is the teaching, the care of the sick, the thinking of the inventor, and the intelligent work done by the visitor that count. If this is once clearly understood by the public we may safely leave such attacks as have recently disturbed some of the friends of organized charity to run their harmless course.

THE COMMON WELFARE

WISCONSIN COURT FOR COMPENSATION

The Supreme Court of Wisconsin is the third state court of appeal to declare itself on the constitutionality of workmen's compensation—the second to answer the question affirmatively. Washington and Wisconsin are thus aligned against New York.

The Wisconsin test case—*Borgnis et al. vs. Falk Company*—presents peculiar features. Two employes working at hazardous occupations brought suit to enjoin this company from electing to become subject to the provisions of the state compensation law¹ on the ground that such election would work irreparable injury for which they would have no adequate remedy at law, because they would be obliged either to break their existing contracts or to lose their common law remedies for their employers' torts. The defendant company alleged that its election would work no such injury, on the novel ground that "Chapter 50, Laws of Wisconsin for 1911, violates the constitution of the United States and the constitution of the state of Wisconsin, and is therefore null and void." The grounds for this claim were set forth in detail. The circuit court of Milwaukee decided in favor of the plaintiffs, thereby indirectly asserting both the constitutionality of the law and the fact that the law may work hardship to the employe. The case was appealed, and to the Supreme Court was left the responsibility of throwing the law out or defending it as against both parties to the suit. This court reverses the decision of the circuit court on the ground that the election of compensation would work these employes no irreparable injury. Judge Winslow, who writes the opinion, holds that, in this case, where the contracts were written,

if their employer breaks his contract of employment because they decline to accept the new law they have adequate legal remedies for the recovery of damages. If, on the other hand, they elect to come under the law

themselves, they lose no vested or contract right, and are not damaged in the eyes of the law by the change in their remedies for future torts.

The complaint should, therefore, the court holds, have been dismissed on the pleadings. The major part of the decision addresses itself, however, to the task of combatting the arguments of the defense against the constitutionality of the law. Says Judge Winslow:

It is a matter of common knowledge that this law forms the legislative response to an emphatic, if not a preemptory, demand for a law that will offer an escape from the troublesome and expensive luxury of personal injury litigation.

A law of such importance, he argues, must be sustained if it passes the constitutional test. A written constitution has the disadvantage of being hard to adapt to changing conditions and ideals. This makes it necessary, in the view of this Wisconsin supreme bench—and here their approach to the matter is from the opposite angle to that manifested by the New York Court of Appeals last winter—this makes it necessary that, when no express words forbid a law, general constitutional provisions be interpreted as broadly as possible, in order to reconcile twentieth-century laws with eighteenth-century constitutions. As the Wisconsin law is not compulsory it comes into conflict with no express provisions of the constitution.

The most important charges brought against it are that removal of the defenses of assumption of risk and fellow servant's negligence is contrary to public policy; that it makes false classifications; that the principle of election is in reality a club over the head of both employer and employe; and that on the industrial accident board are conferred powers that are judicial.

Public policy, says Judge Winslow, is determined either by the constitution or by the legislature. The defences which have been withdrawn by this act were not given by the constitution but were evolved by the courts, and the passage

¹See *THE SURVEY*, October 14, 1911.

of this law by the legislature proves that their withdrawal is within the scope of public policy.

The classification under the act was objected to because it covers not merely hazardous but all trades, and because it excludes industrial establishments employing not more than three workmen. Limitation of such laws to hazardous occupations, says Judge Winslow, may be more persuasive legislation, but there is no constitutional objection to the inclusion by the legislature of all occupations, especially since, wherever an accident occurs, there is hazard. On the other hand the exclusion of enterprises employing few workmen is justified by the fact that in establishments where few are employed knowledge of dangers and consequent avoidance of accidents are comparatively easy.

The charge that the Industrial Accident Board is given judicial powers Judge Winslow denies, pointing out that health boards and many other such bodies are given like quasi-judicial powers to ascertain the facts and administer the law, but that as in all such boards, the courts are expressly given the power of determining whether this board is going outside of its jurisdiction and of reversing its decisions on this ground.

The objection that the system of election is a club over the heads of employer and employe Judge Winslow holds to be a matter of conjecture. He suggests the possibility that it may not work out to be a coercion but feels that the final decision on this and many points of detailed criticism can only be determined as special cases arise. This test case, he believes, can only settle the fundamental questions involved in the act. Noteworthy briefs in the case were submitted by the attorney general and the Wisconsin Industrial Commission.

CINCINNATI A LABORATORY IN INDUSTRIAL EDUCATION

The National Society for the Promotion of Industrial Education selected Cincinnati as the most appropriate place for its convention this year because of the many latter-day types of industrial education represented within its city limits. The first session of the recent convention was devoted to a pre-

sentation of the organization and results of these different institutions; the co-operative plan of the University of Cincinnati, the co-operative high school, the part-time school for apprentices, and the Ohio Mechanics' Institute. Among these institutions the description of the workings of the part-time school claimed the greatest interest on the part of the audience. This school represents a co-operative arrangement between the public schools and employing establishments by which apprentices in the machine and printing trades spend four hours a week in one of the public schools under a special teacher, receiving instruction in English, mathematics, drawing, and technical matters. The acute problems presented in securing the interest and confidence of the apprentice-boy type were vividly brought out by J. H. Renshaw, and strong endorsements of the school contained in letters from metal trades and printing employers and local labor unions were placed on the screen.

At the banquet in the evening about three hundred persons listened to discussions by H. E. Miles, Frank Duffy, and James P. Monroe upon the topic How Shall the Obligation to Provide Industrial Education be Met? Mr. Miles, who is chairman of the Industrial Education Committee of the National Manufacturers' Association and also president of the Wisconsin State Board of Industrial Education, urged the need of support for this work by the employers of the country and also the necessity for state aid and control. Mr. Duffy, who is secretary-treasurer of the United Brotherhood of Carpenters and Joiners of America, expressed the strong approval of organized labor in regard to the factors of the industrial education movement with the single exception of the trade school under private support, which attempts to turn out journeymen workmen through short courses of instruction. He argued that in view of the mobility of both labor and employment opportunities to-day the responsibility for support of industrial training should rest not only on the community but on the state and finally on the nation.

The professional session of Friday morning was devoted to a discussion of

what types of continuation schools are most needed in American conditions. A. L. Williston endeavored to show that the evening school and the day continuation school are not in opposition but are both necessary elements in a comprehensive continuation school program. He pointed out that the evening school is not an institution that will be set aside by the growth of the part-time school but one which has a permanent place—and that a very important one—in a scheme of industrial education. He admitted that the evening school is confessedly not the place for boys between fourteen and sixteen years, and that in the skilled trades, where conditions are favorable, we must expect that the apprentice problem will be increasingly cared for by part-time day schools; but, he maintained, given the general conditions prevailing in American life, the evening school must continue to be the main opportunity for supplementary education for workers above seventeen and eighteen years of age.

FEDERAL LEGISLATION ON VOCATIONAL EDUCATION

Following this discussion the report of the committee upon national legislation, presented by David Snedden, commissioner of education of Massachusetts, was heard with much interest. This report, which represents the labors of a committee of five who have devoted a large amount of time and study to the subject, concerns itself, first, with an analysis of Senate Bill No. 3, commonly known as the Page Bill, and, second, presents a substitute bill which in the judgment of the committee guards against certain dangers in this bill. The points upon which the committee laid stress are as follows:

The encouragement and assistance of secondary vocational education in agriculture, industries, and household arts, in the various states, presents a problem of such magnitude that your committee feels that the proposed bill should confine itself to this field alone; and that provisions for increased assistance to an additional supervision of branch experiment stations and college extension work should be made in a separate measure.

So much uncertainty now prevailing as to what constitutes vocational education, your committee believes that the bill should con-

tain a series of definitions indicating the types of education contemplated and the standards applicable to its administration.

In order to insure an economical and efficient expenditure of the proposed grants, your committee believes that primary responsibility for approving plans and enforcing standards in the types of vocational education contemplated should rest on the one hand in a single national authority and on the other, as far as practicable, on a single authority in each state and territory. Only in this way, in the opinion of your committee, can efficiency be guaranteed.

At the annual business meeting¹ following a committee was appointed to urge upon other interested associations the support of the society's bill for national legislation.

The afternoon session of Friday was devoted to discussion of the question, What Can be Done for the Factory Worker Through Industrial Education? Almost all of the study and constructive programs in the past have aimed either at the preparation or the further development of the worker in the skilled trades, and it was the idea of the program committee that a very useful purpose would be served by stimulating further study of the great bulk of the factory workers in relation to industrial education. The presentation by Charles A. Prosser, deputy commissioner of Education of Massachusetts, was regarded as a genuine contribution to the subject. Of equal practical value with his constructive suggestions was his analysis of the many limitations which surround undertakings in this field. He held that in many low grade industries, such as candy-dipping, there is very little sub-

¹The officers for the ensuing year are: President, W. C. Redfield, vice-president of the American Blower Company and congressman from the Sixth New York District; Vice-President, Howell Cheney, of South Manchester, Conn.; Treasurer, Frederic B. Pratt, Brooklyn. The board of managers is constituted as follows: Class of 1914:—Frederick A. Geier, Cincinnati, O.; Jane Addams, Chicago, Ill.; F. J. McNulty, Springfield, Ill.; W. A. Layman, St. Louis, Mo.; Louis Rouillon, New York city; H. E. Miles, Racine, Wis.; Howard P. Eells, Cleveland, O.; Walter Laidlaw, New York city; Chas. A. Bookwalter, Indianapolis, Ind. Class of 1913:—James P. Munroe, Boston, Mass.; J. W. Lieb, New York city; V. Everit Macy, New York city; Frederick P. Fish, Boston, Mass.; Frank Duffy, Indianapolis, Ind.; Charles H. Winslow, Washington, D. C.; A. Lincoln Ellene, Boston, Mass.; Chas. R. Richards, New York city; George N. Carman, Chicago, Ill. Class of 1912:—John Golden, Fall River, Mass.; Magnus W. Alexander, West Lynn, Mass.; Chas. S. Howe, Cleveland, O.; John Mitchell, Mt. Vernon, N. Y.; Alexander C. Humphreys, New York city; Arthur C. Williston, Brookline, Mass.; Florence M. Marshall, New York city; J. W. Ferguson, Paterson, N. J.; T. W. Robinson, Chicago, Ill.

ject matter which can be made a basis for technical instruction, and that in these lines the possibilities for supplementary education must rest largely upon a better preparation for citizenship and the opening up of opportunities towards other careers.

Saturday morning brought out a debate on whether trade schools for youths above sixteen years of age should be provided at public expense. The affirmative side of this proposition was presented by Carroll G. Pearse, superintendent of schools of Milwaukee, who presented a strong array of facts from the workings of the Public Trade School for Boys supported by the city of Milwaukee. After his presentation George M. Forbes, president of the Board of Education of Rochester, argued that from all considerations—educational, social, and industrial—the industrial school for boys between fourteen and sixteen years of age possesses a prior claim upon public support, and that the burden of proof still rests upon the advocates of the trade schools for youths above sixteen to show economical results justifying the large expenditure involved in such schools.

FORWARD STRIDE IN LEGAL AID MOVEMENT

A permanent national association of legal aid societies is to be the outgrowth of a convention held November 10 in Pittsburgh. Although the New York Legal Aid Society has completed its thirty-fifth year, this Pittsburgh meeting marked the first attempt to bring together representatives of all organizations doing legal aid work.

Fifteen delegates represented thirteen organizations, ranging from committees of associated charities to a municipal bureau. Only two organizations doing such work were not represented: *viz.* the New Jersey Legal Aid Society, Newark, N. J., and the Los Angeles Legal Aid Society. A Washington organization was reported to be defunct. Samuel Scoville, Jr., of Philadelphia, and H. V. Blaxter, of Pittsburgh, who instigated the present gathering, were appointed a committee to report upon the "necessity, scope, and character" of a national organization. They will report

to Arthur von Briesen, president of the New York society, who will issue the call for an organizing convention.

To the West was generally accorded the distinction of presenting the most interesting and progressive idea of the convention. Kansas City, in the person of C. J. Fleming, advanced the postulate—apparently a novel one to a majority of the delegates—that legal aid to the poor should properly be a function of the city government.¹ Mr. Fleming represents the legal aid bureau of the Board of Public Welfare and was able to speak from practical experience of the work as a municipal undertaking. He ascribed the formation of the bureau to abuses of the "jack-rabbit" or aldermanic courts.

The principal discussions focused upon the two chief problems of all legal aid society work—the victimizing of foreigners, and the operations of loan sharks. Evidence was given that attorneys interested in the situation are reaching at least approximate agreement throughout the country upon the remedial measures necessary to protect the poor and ignorant. Mr. Blaxter and other Pittsburgh speakers offered striking information as to methods used to victimize foreigners. Delegates were told that Edgar Prochnic, Austro-Hungarian vice-counsel in Pittsburgh, estimated—after an investigation—that his people in the steel district were victimized in various ways to the extent of \$1,000,000 in the year 1910. Gino C. Speranza, deputized by the Italian government to investigate the victimizing of Italians in the Pittsburgh district, was reported to have found conditions equally bad among his fellow-countrymen. He placed the principal blame upon naturalized and English-speaking Italians who are appointed as constables and similar minor officials.

Leonard McGee, attorney for the New York Legal Aid Society, summarized the laws and methods, particularly in New York and Massachusetts, which have checked, in a measure, the aggressions

¹Bulletin No. 7 of the Milwaukee Bureau of Economy and Efficiency has just opportunely come from the press. The subject is Free Legal Aid, and the writer is Fred A. King. The report was prepared to support a bill before the legislature looking towards the "creation of a municipal bureau to furnish free legal aid and advice to persons financially unable to hire an attorney."

of loan sharks. His preliminary discussion of the extent of the evil and the extortionate rates charged gave force to his plea for immediate action. He cited the recommendations adopted by the conference on the loan shark evil, held in New York on May 18 under the joint auspices of the Russell Sage Foundation and the Merchants' Association of New York. A banquet, at which Judge John D. Shafer of the Allegheny county bench was toastmaster, was attended by the delegates and 170 business and professional men of Pittsburgh.

Visiting delegates and organizations represented were:

- Chicago—Legal Aid Society, Rudolph Matz, president; Mrs. William E. Boyes, superintendent.
- Cleveland—Legal Aid Society, Isadore Grossman, attorney.
- Cincinnati—Legal Aid Society, Frank E. Burnett, attorney.
- St. Louis—Legal Aid Committee, Bar Association, Charles R. Skinker, chairman.
- New York—Legal Aid Society, Arthur von Briesen, president; Leonard McGee, attorney.
- Buffalo—North American Civic League for Immigrants, Chauncey L. Hamlin, secretary.
- Boston—Legal Aid Society, William Sabine, attorney.
- Baltimore—Legal Aid Committee, Associated Charities, W. C. Coleman, chairman.
- Atlanta, Ga.—Legal Aid Committee, Associated Charities, Philip Weltner, secretary.
- New Rochelle, N. Y.—Legal Aid Society, W. G. C. Otto, attorney.
- Rochester, N. Y.—Legal Protective Committee, George S. Van Schaick, attorney.
- Philadelphia—Legal Aid Society, Samuel Scoville, Jr., attorney.
- Kansas City—Legal Aid Bureau, Board of Public Welfare, C. J. Fleming, attorney.
- Columbus, O. Associate Charities, Otto W. Davis.

THE DAY OF THE CITY EXPERT

Expert service in municipal affairs—its demonstrated need and its demonstrated results—may be said to have been the dominant note of the Richmond meeting of the National Municipal League. This fact was emphasized not only in Richard Henry Dana's paper on Anti-toxin for Municipal Waste and Corruption, and in the report of the league's committee on the subject of the selection and retention of experts, but also in a number of other reports, nota-

bly one from the committee dealing with the question of a model street railway franchise. In discussing the latter one speaker drew attention to the fact that if had been prepared by experts and had been discussed by experts, referring to Delos F. Wilcox of the Public Service Commission of New York city, Harry P. Nichols, franchise expert of the New York Board of Estimate and Apportionment, and F. S. Spence, member of the Board of Control in Toronto. Dr. Wilcox in giving point to the suggestions as to taxes, labor settlements, and human wear and tear to be embodied in a model franchise, said:

We have considered with care the question of compensation for franchise. In our judgment the car riders should not be taxed for the relief of the general tax rate. While there are strong arguments for the policy of requiring a franchise holder to pay taxes at the regular rate on the value of its property outside of the streets, we think that at least all compensation in excess of this requirement, whether in the form of general city taxes, car license fees, a percentage of gross receipts, or a division of net profits, should be applied either to the construction of extensions on the city's account or to the amortization fund, or should be remitted for the benefit of service or for the reduction of rates.

The public necessity of maintaining continuous service on a street railway is so great that in our judgment the franchise should provide some method for the arbitration of labor disputes so as effectively to prevent strikes. We have been impressed by observation and experience with the tremendous cost in human vitality represented by the time and energy wasted in transit. It is often true that a half-hour or an hour spent on a crowded, poorly lighted, badly ventilated street car at the end of a hard day's work is a greater tax upon a person's strength than an extension of the day's labor for the same time would be. The cost of transportation is not to be measured merely by the fares paid. The representatives of the city in framing a street railway franchise contract and in the regulation of street railway service should constantly keep in mind the conservation of human energy as well as financial considerations.

Efficiency in municipal work was another note that was struck in a number of addresses and especially in Prof. S. N. Gunn's paper on municipal health administration. Dr. E. C. Levy, chief health officer of Richmond, pointed out that economy does not always lead to nor mean efficiency, but that efficiency does mean and does lead to economy.

FRANKFORT-ON-MAIN A CITY OF PROPHECY

William Dudley Foulke's annual address as president dealt also with questions of efficiency, being devoted to a survey of the city of Frankfort-on-Main as an example of comprehensive and effective municipal government to the end of making life better worth living. In concluding his address Mr. Foulke quoted a man high in the Prussian service who had said: "You will finally be able to do what we are doing, but it will take you a long time—it will come by degrees." Pointing out the truth of this statement, Mr. Foulke said:

Municipal aptitudes are not made in a day, they grow with the development of municipal life. Our city governments have been the darkest stains upon our institutions. Things are beginning to improve. There has been a great moral awakening among our people; the necessity of better government is perceived by all. The desire is there, and we are gradually learning how we may obtain it. Not the least among the duties of the Municipal League is the duty of developing this sentiment of local patriotism. It might be unwise for us at this moment to attempt all the varied activities which are so successfully accomplished in Frankfort. We must content ourselves at first with smaller things. We have immense aptitudes in other directions, and we must make them available for the regeneration of our city communities.

SOCIALISM IN AMERICAN CITIES

The secretary of the league, Clinton Rogers Woodruff, in his annual review of the municipal situation, incidentally called attention to the fact that his first review, seventeen years ago, occupied eight and a half pages, while the one presented a year ago at Buffalo required eighty-two pages. The success of socialist candidates who ran for mayor in the November elections, of which the Rev. George Lunn's victory in Schenectady was perhaps the most striking, gave special timeliness to Mr. Woodruff's review at length of the growth of the socialist movement in the cities. He pointed out that at the several elections held during the year 1911 upwards of 500 socialist candidates have been elected to municipal office. In commenting on the general effect of socialist rule, es-

pecially in Milwaukee, Mr. Woodruff said:

Notwithstanding shortcomings in the way of community courtesies and life, the Seidel administration has been honest and fairly efficient. Although it has made some serious mistakes, as was to be expected under the circumstances, being entrusted with the administration of a great city in the face of high expectations excited by a long discontented people, it has adopted many useful, constructive measures. It is difficult to get at the real facts of the situation and estimate the value of the socialist contribution to municipal development. On the one hand the anti-socialist press are extreme in their denunciation of and criticism of the socialist administration, and unfair in the extreme in commenting upon its activities. On the other hand, the bitter abuse and constant insults that have appeared in the columns of the *Social Democratic Herald*, the recognized organ of the socialist propaganda, some of which have been over Victor Berger's own signature, indicate the animus of the administration that makes it impossible for other than socialists to support the candidates and propaganda in the future, unless the electorate should be confronted with a choice between serious evils—of which the support of the socialists might be the least.

The decisive effect of the socialist propaganda is illustrated in another direction. The socialist members of the last session of the Wisconsin legislature fought bitterly the non-partisan city government and majority-rule measures that were advocated by the civic bodies of the city, and eventually defeated them. Such an attitude, coming at a time when party lines are being broken down to a greater extent than ever before in municipal elections, and when party designations are being eliminated from the official ballots in a most satisfactory way, seems a step in the wrong direction.

It is really too soon to estimate at its true value the socialist movement in the city. The tendencies that have herein been indicated are dangerous ones, if allowed to go unchecked. However, if the socialists place the emphasis upon the many excellent features of their platform, and eliminate the idea of class distinctions, and will offer to work with all other citizens irrespective of party who have for their object the advancement high ideals in city life, they will contribute an earnestness and an aggressiveness of great value.

Simultaneously with the Richmond meeting announcement was made of the donation to the National Municipal League by "friends of good city government in Cincinnati" of \$500 to be used as a prize fund for the best annual essay written by a student in the University of Cincinnati on some subject bearing upon the municipal government or civic life of Cincinnati.

FLORIDA AND THE FUTURE

The old saw that a child can put questions which wise men cannot answer finds a modern version in the discussion of those phases of childhood which are recognized to-day as social problems. Prominent on programs, and often coming to the front unbidden, these questions ran through the sessions of five state conferences of charities and correction held last month. West, South, East, and North found themselves similarly engaged. Iowa asked: "Am I a good parent?" and reviewed her juvenile court and child labor situations; Missouri, holding two evening sessions with the Kansas City Child Welfare Exhibit, learned from a leader in the Men and Religion Forward Movement what is the social and religious value of the child; speakers at the Pennsylvania conference called strongly for the prevention of blindness in babyhood, and urged, though not without opposition, the forming of a state probation commission; in Minnesota there was outcry against the causes of high infant mortality and the menace of child labor, together with demand for saner treatment of backward children in schools, and a notice to the state that physical, mental, and moral defects which contribute to retardation and delinquency must be discovered; Florida told a tale of conditions of neglect where the state is responsible which set the teeth on edge, but also of new impetus given to forward movements, such as that to establish juvenile courts.

This last was Florida's first state conference, meeting at Jacksonville. There was desire, therefore, to gauge interest and to note how currents tended. "That the social workers of the state are alive and up and doing, that the people in this land of flowers are intensely interested in 'How The Other Half Lives,' and that Florida must be counted among the progressive states of the union along lines of social reform," was the meaning of the gathering as one Florida leader read it.

Reports from institutions brought out startling facts which are summarized by a correspondent as follows:

W. H. Milton, president of the State Reform School at Marianna, admitted that boys and girls are being provided for in the same buildings, and that because of lack of sufficient appropriations from the state inmates have not been properly clothed, fed, nor educated. The report from the State Hospital for the Insane revealed not only that Florida has no suitable place for feeble-minded and epileptic adults, but that in existing institutions little children are housed with inmates of these classes. Florida has nine state institutions: the State Reform School; the Insane Hospital; the School for the Deaf and Blind; four orphanages denominational in their work; and two orphanages not denominational. No specific provision has yet been made for the care of children who are feeble-minded, epileptic, backward, tubercular, or delinquent. The present system of caring for criminals was condemned in equally strong terms. The need of a State Board of Charities was brought out by Frances Anderson of the Jacksonville Woman's Club.

The immediate effect of the conference therefore was to help crystallize public opinion in Florida in demanding better care for the wards of the public. A joint meeting of the conference and the State Federation of Women's Clubs enunciated a broader program of social work for this newly awakened state, those in attendance expressing their determination to enlist the active fellowship of friends and citizens in a new vision of the commonwealth. The chief speaker was Edward T. Devine.

Judge Samuel Black, of Columbus, O., outlining the new spirit of justice to juvenile delinquents, urged the use of the family home in placing out dependent children. Florida passed a juvenile court law last winter, and Tampa, Pensacola, and Jacksonville early took advantage of it; the conference will, it is believed, lead to other courts for children throughout the state. Suggestion was closely followed by action in another field. Hardly had a resolution been adopted urging every city and town in the state to organize its charities, when three cities—Sanford, Arcadia, and West Palm Beach—took practical steps in this direction. Organized charity was described as the mother of recent American social movements by V. R. Manning, secretary of the Jacksonville Associated Charities. Mr. Manning told how, from its knowledge of the histories

of hundreds of families in the city, his society has helped to launch medical inspection of schools, a municipal tuberculosis pavilion, and two industrial schools. Dr. Charles Terry, health commissioner, told of the work of the force of trained nurses and physicians in the Jacksonville schools. Twenty per cent of the pupils have been found in need of special care. The social needs of the small towns throughout the state were emphasized and a strong plea made that one central society be formed in each to meet the needs instead of small separate organizations to deal with each problem.

MISSOURI SOCIAL WORKERS MILITANT

"One thousand members in 1912!" This ambitious membership slogan—requiring a three-fold increase—is an indication of the new spirit of doing things which has come over the Missouri Conference of Charities and Correction, and which to the minds of the members presages for next year a campaign for social legislation such as the state has never known. A note of revolt against the political and non-professional standards alleged to exist among public servants in the state's institutions was sounded at the outset of the meeting on November 9, at Kansas City. T. J. Riley, director of the St. Louis School of Social Economy, and president of the conference, put the question: "Why should four years' service by superintendents of charitable institutions disqualify them from continuing in their positions?" Henry Faxon, the man most responsible for securing the recent increase in the rate for county support of the insane in state hospitals, made a plea for improving the quality of service in public institutions, and Dr. M. A. Bliss proposed the merit system for selecting employees. The evening sessions in conjunction with the Kansas City Child Welfare Exhibit gave head to the movement for the establishment by the next legislature of a children's agency under the State Board of Charities and Correction. This year, for the first time, the almshouse superintendents demanded a place on the program. W. N. Wil-

son, president of the state association of almshouse officials, laid responsibility squarely upon the public for much of the good and bad in these institutions. This association, it was brought out, is doing constructive work. During the past year two-thirds of the almshouses have got out from under the lease system of operating county farms. At this announcement the conference voted to wage an active campaign until all counties should employ their superintendents on salary. Uniform financial and population records are being adopted, and a resolution was passed petitioning the governor and all interested organizations to demand the provision under the State Board of Charities and Corrections of an inspector who shall visit every almshouse once a year. No less significant were the promptings toward "curing the century-old jail evil" brought out at this meeting. L. A. Halbert, superintendent of the Kansas City Board of Public Welfare, described the municipal farm for work-house prisoners in that city. He contrasted this scheme of outdoor work for misdemeanants with the no-work-at-all régime which he declared is the rule in county jails. Mr. Halbert said:

I insist that work for prisoners should stand the same tests as work for free men. Up-to-date methods should be used, the work should be healthful and should have a direct connection with the support of the prisoner and his family. . . . Farm work avoids most of the criticisms lodged against other forms of prison labor. However, it should not be taken as a panacea, for there still remain the old problems of discipline and of moral uplift which can be met only by having officials of high character and ability.

Charles A. Ellwood, professor of sociology in the University of Missouri, whose investigations several years ago first brought to public notice the abuses in the jails and almshouses of the state, took up at this session the "worn-out and complicated fabric of criminal court procedure," urging the establishment of a Missouri branch of the American Institute of Criminal Law and Criminology. Mrs. Raymond Robins of Chicago, president of the National Women's Trade Union League, and Mrs. Florence Kelley, secretary of the National Consumers' League, were the chief speakers

at the sessions devoted to the improvement of working conditions, at which the facts gathered by Ruth White, of the Board of Public Welfare (depicted in last week's SURVEY) were brought out.

The statement that out of 300 inmates of houses of ill fame in Kansas City, 154, or 51 per cent, received less than \$6.00 per week when engaged in honorable pursuits, and only 10 per cent as much as \$10.00 per week, was not the least thought-provoking of the points marshalled in support of the movement for minimum wage boards.

THE CHILDREN OF THE NORTHWEST

The call for the conservation of childhood was sounded quite as specifically at Duluth as at Jacksonville or Kansas City. Here Minnesota's twentieth conference was in session, November 9-12. As a probable result, writes one delegate,

We are soon to have a conference on child-helping service, looking to effort to co-ordinate all responsible and responsive agencies in co-operative service.

In his opening address, P. M. Ringdal, president of the conference and chairman of the State Board of Control, pointed out that delving for causes does not in itself answer the demands made upon charitable and correctional agencies today. There must be programs of action based upon classification of causes. By way of illustration he told of the work under the \$10,000 appropriation granted by the last Minnesota legislature for study of the causes of defectiveness, delinquency, and crime. A closer study of children through case diagnosis, with the object of discovering those physical, mental, and moral defects which contribute to retardation and delinquency, was urged by C. E. Faulkner, superintendent of the Washburn Memorial Orphan Asylum, Minneapolis. Said Mr. Faulkner in part:

The case diagnosis of the examining physician should be comprehensive and specific, and the first use to be made of the physician's findings should be by the court which is seeking to discover the duty of the state to the child. The state is morally bound to know

that its interference is helpful. It cannot dispose of city-bred boys who have an inheritance of graded schools, public libraries, industrial training schools, free gymnasiums, and public playgrounds to the farm without fair compensation for these advantages. If the state would make farmers of its children, it must open to them the schools where farming is taught.

Mr. Faulkner declared that in Michigan and Minnesota, which he described as the two states foremost in exemplifying the policy of direct state care for children who become wards of the public, children are sent to the farms without preparation, and that in neither state have these children found their way into the agricultural schools supported by their states for the benefit of all. Michigan could trace but one such pupil, he said, and Minnesota only two. He went on:

Our idea is to enlarge the work of the State Public School for Dependent and Neglected Children in a manner to permit the employment of trained instructors in agricultural science and the vocational callings best adapted by choice and fitness to the children dealt with. This policy would suit the education to the needs of this class of children, place those so dealt with under the supervising oversight of the state as a superior guardian, and permit the transfer to the state school from the co-operating institutions supported by private benevolence or other organizations.

Prof. J. B. Miner, psychologist at the state university, urged the abandonment of "the error of basing the legal age of a child on chronological instead of mental standards." The dunce in school, he said, should not be held to the same standards as others of his years; he is younger than they in mental development. Infant mortality and juvenile labor were other phases of the child problem brought out at Duluth. Minnesota through its last legislature amended its compulsory education law so as to abolish the issuance of labor permits on the ground of poverty to children under sixteen. From recent figures Eugene T. Lies, general secretary of the Associated Charities of Minneapolis, judged that the operation of the amended law will reduce by two-thirds the number of labor permits issued. He emphasized the need of providing scholarships for the few to whom the law might

work a possible hardship, and argued that these should be based on the need rather than on the earning capacity of the child.

PENNSYLVANIA SUBSIDIES CALLED A CORRUPTION FUND

"A frank attack on the state subsidy of charitable and educational institutions," writes an insurgent Pennsylvanian, was the feature of the conference held at Pittsburgh, November 14-16. With no mincing of terms, speakers told of directors of hospitals, of the heads of various charitable institutions, and of educators being forced to close their mouths and refrain from criticism of political corruption lest they endanger the state appropriations to institutions in which they are interested. It was charged that the appropriation "bug-bear" is used to chain the tongue of the college professor in Pennsylvania who displays too active an interest in reform movements; that the charitable appropriations are in essence a corruption fund. The attack upon the present system was led by Prof. Carl Kelsey of the University of Pennsylvania; W. H. Nibecker of Glenn Mills; Allen T. Burns of Pittsburgh; and William B. Buck of Philadelphia. In defense appeared President Francis J. Torrance and Secretary Bromley Wharton of the Board of Public Charities. An argument against the present system of appropriations, apparently new to the majority of the delegates, was advanced by Professor Kelsey when he asserted that state subsidies lessen private charity. Palliative measures suggested were the adoption of a system of measured service; the classification of institutions doing what might properly be considered the state's work; and the payment by the state of so much per case to appropriate institutions.

Ministers representing four denominations contributed four of the most stirring addresses of the conference. A plea to social workers to interpret to their respective communities the results of their experience was made by the Rev. R. M. Little in his presidential address. The church is ready and willing to do social work, declared Dr. Samuel Van Vranken Holmes, Buffalo, N. Y.,

but it does not know how. Church workers should be content to begin with individual cases in order that they may prepare themselves to deal with neighborhood and community problems.

Rabbi Rudolph I. Coffee of Pittsburgh ascribed the source of ideals in social work to religion. Dr. W. E. McCulloch of Pittsburgh emphasized the necessity of co-operative effort by all denominations.

Speaking on the topic of the Courts and the Child, Roy Smith Wallace of Philadelphia uncovered active centers of opposition to a plan for a state probation commission. The representatives of several counties voiced their hostility to the plan. Medical school inspection, public preventive medicine, and protection of the milk supply were phases of public health which proved of especial interest to the conference.

WHERE STATE CARE AS YET BREAKS DOWN

Perhaps the most caustic and sensational arraignment of the failure of American states as yet to think through from beginning to end their provision for delinquent, neglected, and dependent children was that made by an Iowa probation officer at the Iowa City conference. Childhood had come up for discussion under such headings as child labor, the juvenile court, and the consulting psychologist in the public schools. In answer to the question, "Is Iowa a good parent?" Henry E. C. Ditzen, probation officer of Davenport, scored the laws which prevent the admission of a pregnant girl into the state industrial school at Mitchelville, and at the same time make no other provision for adequately dealing with her. Mr. Ditzen said:

After confinement girls may be discharged if found to be pregnant, and this offers an inducement to them to become so. If the rule is correct, a girl in that condition can defy the law, because she knows she cannot be committed to the industrial school and her age will prevent her from being put into jail—she can neither be punished nor reformed.

Mr. Ditzen cited another case where the present scheme of state institutions

breaks down—that of a consumptive boy charged with delinquency:

The lad is refused admission by the industrial school on the ground that it is not a sanatorium, and by the state sanatorium on the ground that it is not a home for delinquents. He was expelled from the public schools as being dangerous to the health of the other children. The only institution willing to receive him was the public street, and there he was at last report an outcast. He has no chance to be reformed, no chance to be cured, no chance to be educated—except in the ways of the street. That lad may do anything he wants to, can be as criminal and tough as he pleases, for he cannot be put into jail, because he is less than sixteen years old and is not wanted at the industrial school.

Continuing, Mr. Ditzen declared that there is no state institution taking care of babies less than a year old. If an infant is syphilitic, he said, the state wants to care for it less than ever, although it may be the offspring of a couple the state has recklessly allowed to marry.

With its sessions conducted under the auspices of the state university and largely attended by instructors and students in the economics and philosophy departments, this Iowa conference, held at Iowa City, November 19-21, "was a manifestation," to quote a participant, "of the idea that the theoretical and the practical in the problems of human life must get together in the great campaign for higher living." The alignment of science and social action was suggested in Dr. Clarence Van Epp's plea for the sterilization of the defective, the insane, and the criminal, by vasectomy. Point was given to the discussion of county hospitals in relation to the general topic of public health by the fact that only within recent years have such hospitals for the care of tuberculous patients been permitted by the Iowa law. At the present time no county hospital in Iowa is open to such patients, although there are more than 10,000 people in the state suffering from tuberculosis. More than 1400 people died last year of the disease. The only sanatoriums for their care are the state sanatorium at Oakdale, a private hospital at Fort Dodge, and Ridge Camp Hospital, Des Moines. Not more than 200 people can possibly be cared for in the three combined.

THE KNOW-YOUR-CITY SURVEY IN SYRACUSE

It is estimated that 8,000 persons have studied Syracuse through "Know-Your-City Week" by attending the meetings. These 8,000 are the mediums through which the gospel of general city betterment . . . will be spread.

—This statement from the *Syracuse Post-Standard* on Saturday morning, November 25, came after a week of reports and discussions had brought out the result of investigations made by the Syracuse social survey. It shows something of the interest of the citizens of Syracuse in this preliminary inventory of social conditions and forces in their city.

Syracuse prepared for this week of introspection by beginning as far back as July to cast up its social accounts. A central committee of twelve, representing the Ministerial Association, Central Trades Assembly, Chamber of Commerce, and Associated Charities, under the chairmanship of the Rev. Murray Shipley Howland and the secretaryship of Paul E. Illman of the Associated Charities, began a preliminary study of things as they are. Just as a

business man takes stock every year, they wanted a stock-taking of the conditions that affect life and health and general progress within the Syracuse city limits; and from these human balance-sheets they purposed to draw out what immediate reforms were needed and what phases of the local situation needed more extended investigation. This rapid preliminary stock-taking under the direction of Shelby M. Harrison, who spent a month in Syracuse in midsummer, followed seven general lines:

- Health conservation and sanitation,
- Housing conditions among unskilled workers.
- Betterment agencies,
- Foreign population,
- Juvenile delinquency,
- Civic improvement,
- Labor conditions.

RESOLUTIONS SUBMITTED FOR A WORKING PROGRAM

With reports in hand on these subjects, the central committee formulated seven resolutions as a preliminary working program for the city, which would not be partisan, sectarian, nor sectional, but would aim at healthy industrial and social growth. In an eighth resolution this remarkable working group, representing forces which are not always in accord in city life, sent back to the bodies which created it, and which it jointly represented, a recommendation that they take action to see that the program is entered upon. The resolutions:

First—That the mayor and Common Council be urged to establish a City Planning and Housing Commission to secure a plan for the city's growth and development, and draw up a housing code such as would meet the needs of the city for some time to come.

Second—That the Board of Education be petitioned to consider and adopt a far-reaching plan for the education of the foreign population of the city by a larger provision of night schools, by the introduction of civics and industrial courses in night schools, and by the extension of vocational training to the grades.

Third—That the police and school departments be petitioned to enforce the child labor laws relative to the street trades.

Fourth—That the Board of Health should be petitioned to provide:

(a)—For the inspection of mercantile establishments and for the enforcement of those provisions relating to child labor, hours of

work of women, and sanitary conditions under which such people work.

(b)—For the publishing monthly of the milk score of all milk producers whose milk is sold in the city.

(c)—For more rigid inspection of tenements.

(d)—For the engagement by the city of the services of some sanitarian of national standing to study and report on the needs of the public health of Syracuse, as a basis for planning future health work.

Fifth—That the employers engaged in such industries as require the plant to be in continuous operation be urged to make such adjustments as to assure every laborer one day of rest in seven.

Sixth—That there should be among the betterment agencies of the city a closer co-operation expressed in some system, such as a United Charities, Social Service League, or an Associated Charities organized on broader lines than those in existence at present.

Seventh—That the city at large have some organization for the study of the city needs and development and to crystallize the findings of such studies in some yearly program such as this Know-Your-City Week.

Eighth—That to accomplish this end the Central Survey Committee recommend to the respective bodies represented in the committee the formation of a comprehensive and democratic body to study the problems and promote the adoption of the reforms suggested by the survey.

By no means the least interesting feature of this Syracuse undertaking was the co-operation which it enjoyed. The city seemed ripe for such a social revival. It was Syracuse townspeople and not outsiders who first found that out. Individuals and organizations investigated conditions, gave money and time to organizing the week of meetings, provided an educational moving-picture exhibit, arranged for literary, historical, and pictorial exhibits of Syracuse, made charts and drawings to display the findings of the survey, and carried through an essay contest on Syracuse needs among school children. State and national organizations cooperated on a volunteer basis. Speakers from out of the city who pointed the moral of local findings from the vantage point of a national perspective included Mrs. Florence Kelley, Neva A. Chappell, Edward T. Devine, Graham Taylor, William H. Allen, J. Horace McFarland, Paul U. Kellogg, Winfield Scott Hall, John Ihlder, John Daniels, Zenas L. Potter, William Kirk, Anna B. Fox, and Marcus A. Beeman.

 EDITORIAL GRIST

 THE McNAMARA CON-
FESSIONS

GRAHAM TAYLOR

The confessions of the McNamara brothers in the Los Angeles dynamiting tragedy are of the greatest public value. No conviction, however strong the evidence might have been upon which it was secured, could possibly have been ratified by such a unanimity of public sentiment as has been produced by this unexpectedly fortunate ending of these two trials.

For, despite the strength of the prosecution's case and the baffled attitude of the defense, both of which have been evident from the start, multitudes of sincere men, not only in Los Angeles but throughout the whole country, were firmly convinced of the innocence of these guilty men. This persuasion was due perhaps more to the suspicions aroused by the harsh, uncompromising, and unreasoning warfare so long waged against organized labor by certain employers and newspaper men in Los Angeles than to any actual knowledge of the case against the accused men or any personal loyalty to them. The tactics of this prolonged war, which was "without discharge" and without quarter, strengthened the suspicion that the McNamara brothers might be the victims of a "frame-up" by employers and detectives in conspiracy against organized labor. Unjustifiable and incredible as these claims of the accused were at once held to be in the editorial opinion of THE SURVEY¹, yet, as we then said in our plea for "Justice without Fear or Favor", it was none the less unfortunate to give color to these counter-charges by the unusual detective measures employed in the delivery of the prisoners to the California authorities, however extenuating, or even justifiable, they may have been under the circumstances of the acute situation.

Our confidence in the character and capacity of William J. Burns, well

known to us both as man and detective, proves now to have been amply justified in emphasizing the presumption that he must have regarded his evidence against the accused as conclusive. For his integrity as well as his consummate ability are attested incontrovertibly by the admission of the counsel for the defense that there was "no loop-hole" anywhere in the evidence against the men and that everywhere the defense faced "a stone wall."

On this account not only, but still more because of the general considerations involved, we called upon "labor officials higher up to do their utmost to see that justice is done not only to the accused men, but also to their own great cause; to do their utmost to stand with the American public in protecting life and property from the cowardly attack of the bomb-thrower and the dynamiter by fearlessly aiding the courts to find and deal with the facts, without respect to persons." This some of them at least have failed to do. In appealing for the defence fund, which it was their right and duty to do, they went much further than the cause of labor and the public welfare could afford to have them go in pre-judging the case pending in the courts. Certain of their officials and official newspaper organs, without evidence and without discretion, have not only declared for the innocence of the accused men, on their own barest and boldest assumption, but without a shred of attested fact or a hint of direct evidence have spread broadcast the most specific accusations of criminal conspiracy against men who are now cleared from all possible suspicion by the confession of the guilty prisoners. This stunning rebuke to such irresponsibility among the labor leaders and in the labor press is well deserved, and ought to put some of them out of commission.

As was to have been expected, the reaction from the rank and file, and from all the stronger, better men in the lead, has been instantaneous, unqualified, and decisive. There has been little or no equivocation or extenuation. The number of demands for the extreme penalty of the law, even the death penalty, which are reported to have been telegraphed to

¹THE SURVEY for May 6, 1911, page 214.

Los Angeles, is impressive. It means that at last the really responsible majorities in organized labor have learned the belated lesson of this bitterest experience which American trade unionism has ever suffered. It seems inevitable either that both the fanatical and grafting elements which depend upon the "strong arm" methods will be eliminated from the secret policies and the open leadership of the unions, or that their membership will gradually disintegrate by the withdrawal of loyal and law-abiding men. The latter contingency, however, is incredible in view of the economic necessity for the organization of labor and the essential value of legitimate unionism to the maintenance and progress of the American democracy. If, however, withdrawals from the trade unions were to take place on this account, the socialist party is the only organization ready at hand and waiting to receive such seceders. The bids of that party's press for such accessions are prompt and urgent. Many throughout the country are likely to respond, however many were deterred from voting the socialist ticket in the municipal election at Los Angeles. But far larger numbers would doubtless have been so recruited to the ranks of the socialist party, had not many of its papers been foremost in their unjust and untruthful accusations against everyone who has had to do a public duty in the detection, trial, and punishment of these atrocious crimes against life, property, and public welfare.

Whatever effect the efforts to mediate some pact of peace for progress, reported by Lincoln Steffens, may have had in securing the confessions, it seems certain that at least some prominent citizens of Los Angeles have at last been startled to see how much too far the class struggle has been carried there, and to what further lengths it may go if it is not pacifically dealt with now. Whether or no these efforts have had, or should have had, any decisive effect upon the administration of justice in the cases before the courts, opinions are sharply divided, but it is an auspicious token of a brighter future for all America that public-spirited citizens of high standing are moved to take advantage of this crisis

to bring together the contending parties in this desperate fratricidal strife upon some basis of equitable industrial relationship which will at least allow them to live and work together. There can be little doubt in the minds of sober men to whom the facts of the acute industrial situation on the coast have long been known that it is both untenable and extremely dangerous. Those who have bravely grappled with it should be undeterred in their efforts to promote a peaceful and just adjustment in the future, however the immediate issue of the present criminal prosecution may embarrass them. The supremacy of law and the meting out of even-handed justice constitute a separate issue which, for the moment, has the right of way. But however effectively justice has been administered, some more fundamental solution of the industrial problem must be reached than the detection of crime and the sentencing of criminals.

And now, when on this prime point there is an overwhelming unanimity on both sides of the industrial cleavage, it is a supreme opportunity, and no less an imperative obligation, for the organizations of both labor and capital not only to purge themselves from those who incite and perpetrate lawlessness and violence, but to get together to establish a broader and better basis for their working agreements and for the industrial legislation which involves the vital interests of both. We will fall far short of taking advantage of this supreme opportunity if we do not fearlessly discover and thoroughly deal with the conditions which make possible such crimes as the McNamara brothers have committed and which account for the motives which lead men to commit them.

A SCHOOL FOR MAYORS

JAMES P. HEATON

A school for mayors—that is what some call the project. If you would like to become an expert administrator of municipal departments, and enjoy a salary while being taught, this account should interest you. Mrs. E. H. Harriman has started a school where some of the pupils, if they are good

students and proficient in some specific thing, may receive salaries as high as \$4,000 or even \$5,000 a year. Her belief and that of her advisers is that the time has come to begin an experiment in training men for public service through doing work that needs to be done and getting information that needs to be obtained. For this purpose she has given \$80,000, while business associates and friends of the late E. H. Harriman have guaranteed \$120,000. Mr. Harriman believed that the cost of public service, particularly in our cities, could be reduced if officials paid the same careful attention to the problem that railroad managers give to the expense of transporting a ton of freight one mile. His last public utterance reiterated this belief. This interest in municipal investigation as a means for increasing governmental efficiency was shared by Hrs. Harriman, who has watched the work done in this connection by the New York Bureau of Municipal Research. In order to make possible a five years' test of the plan, Mrs. Harriman offered \$40,000 for the first year and \$10,000 a year for the succeeding four years, provided other contributions of \$30,000 a year for the second, third, fourth, and fifth years were obtained. These have been received from thirty of the wealthiest active business men of the country, whose actual interest and not a mere formal support has been persistently sought by Mrs. Harriman, who has thought out each step carefully and deliberately. George W. Perkins, C. A. Coffin, and Mortimer Schiff, as trustees of this fund, will assist Mrs. Harriman in its practical application.

Mrs. Harriman wished to learn how men familiar with governmental affairs would go about the problem of training men for public service to fill the constant demand for experts which the bureau has been called upon to meet. She consulted personally and by correspondence a number of business men, journalists, educators, and public officials as to the need of a new kind of school for the study and administration of public business. All replied that training for this work is necessary and that field service is required to supplement the work of the university and technical schools.

The school will be started in New York, but its scope is intended to be national. The curriculum will embrace the analyzing of budget estimates and all public expenditures, the drafting of city charters, the study of health problems, the standardization of salaries, contracts, and specifications, model municipal accounting, methods of assessing and collecting taxes, and the preparing of official statements for publication. The work will be supervised by the directors of the Bureau of Municipal Research. The field work will also be directed by experienced workers in the bureau or in some of the city departments which have volunteered co-operation.

The school aims to enroll four classes of applicants; college graduates who are anxious to go into public service or social work; accountants who wish to qualify for analysis of public business; superintendents of schools, secretaries of boards of trade, heads of civic organizations; post-graduate students of politics, economics, sociology, law, and journalism who wish practical field work to supplement academic training. Part of the funds will be used to make the results of special studies available for text-book and hand-book uses in colleges, high schools, and accounting schools; but the main object will be to give to tried and proved men of character, with different experiences and interests, careful training that will enable each to apply his peculiar capabilities to the best advantage in public service. The bureau will employ the applicants in practical work that needs to be done in New York and other cities, paying them salaries in the meantime, so that men of experience who are dependent upon their earnings may be able to pursue the course and at the same time render a return for their remuneration. The Bureau of Municipal Research anticipates that in future, besides its present function of investigation of city affairs, a most important part of its activities will be the training of the men who, throughout the country, will aid in the work of applying the tests of scientific management to municipal business, which has suffered from half a century of satisfaction with antiquated methods.

BOOKS

LILIAN BRANDT, Contributing Editor

THE PHILANTHROPIC WORK OF JOSEPHINE SHAW LOWELL. By WILLIAM RHINELANDER STEWART. The Macmillan Company. Pp. 584. \$2.00; by mail of THE SURVEY, \$2.18.

We venture the prediction that this record of Mrs. Lowell's life and work which the president of the New York State Board of Charities has given to "the ever-growing army of students of social subjects" will be reckoned as by no means the least of his public services. Undertaken "with a justifiable diffidence born of inexperience in literary work," it has occupied most of his leisure through the six years since Mrs. Lowell's death; and out of these two conditions has come something which, much more completely than Mr. Stewart in his modesty probably realizes, fulfills his ideal of what the book should be.

With a rare skill—for it is not an easy thing to accomplish even with the most sincere intention—the author has contrived to efface himself: not only by compressing "introductions and explanations in order to leave more space for Mrs. Lowell's writings"; but also by the simplicity, delicacy, and restraint of these "compressed" passages. One sees only Mrs. Lowell; no other personality obscures the picture.

"One of the most useful and remarkable women of the nineteenth century," Mr. Stewart calls her, and it would be hard to find any to disagree. From the early seventies to the close of the century she was clearly a dominating personality in shaping the policies of the charitable and correctional work of New York. The story of her interests and activities is to a large extent the story of the development of social work during those years. It is, however, not a chronological account of this development which the book gives, but, in chapters not very closely connected, the story of Mrs. Lowell's connection with the various achievements and movements in which she was most intimately concerned. Nor is it a complete and chronological story in each chapter, but rather a picture of how Mrs. Lowell felt about the problem, and samples of what she did about it. In the chapter on the Charity Organization Society, for example, there is no attempt to recount her many special interests and services; but extracts from letters show the energy and enthusiasm with which she went into the organization of it and the great amount of time which she gave to it; fellow-workers in the society contribute accounts of the impression she made; and over eighty pages are given up to writings of her own which formulated her ideals for the society and were influential in shaping its policies.

While this record is limited to Mrs. Lowell's "philanthropic work," enough of her per-

sonal history is given to afford a background,—and to make one wish for a great deal more.

"Hereditry was kind to Josephine Shaw, who, on December 16, 1843, was born at West Roxbury, Massachusetts; for both her parents belonged to New England families of distinction and culture." When she was only three years old the family came to Staten Island in order that Mrs. Shaw's eyes might be treated by a certain New York specialist. Except for this comparatively accidental circumstance, probably Boston, instead of New York, would have been the field of Mrs. Lowell's activities. A happy girlhood on Staten Island, broken by five years in Europe and ending with a winter or two at school in Boston, brought Josephine to her eighteenth year and to the outbreak of the Civil War, by which she was to suffer so grievously.

She entered on her first public service by joining the Woman's Central Association of Relief for the Army and Navy of the United States, a branch of the sanitary commission which covered several states. In this she worked with Gertrude Stevens (Mrs. W. B. Rice) and other young women with whom later she was associated in much of her social work. From a little diary which she began just after the battle of Bull Run and kept for sixteen months, the only personal record she left behind her, extracts are printed filling twenty-five pages. They are among the most interesting pages of the book. Her comments, concerned almost wholly with the public events, show how completely the family was absorbed in the progress of the war, and her own remarkable interest in national affairs. At the same time they reveal also the vigor, directness, impulsiveness which were to be characteristic of her more mature life. For example:

"George, also, is rather depressed and everybody generally wants Lincoln to change his cabinet. I don't see the use of being depressed." (George was her brother-in-law, George William Curtis, whom she admired profoundly, and who exercised a great influence on her mind during her most impressionable years).

Later, when she grew impatient waiting for the expected Emancipation Proclamation, she wrote: "Oh, that the Lord would only put it into Lincoln's head to do something strong and decided!"

Speaking of a visit from her soldier brother she says that it "seems almost like a dream. . . . Well, all human affairs are the same; the unhappy moments are long, the happy ones short. That's all bosh, though, for they all seem short to me."

One more quotation, a reflection which

sounds far beyond her years: "These are extraordinary times and splendid to live in. This war will purify the country of some of its extravagance and selfishness, even if we are stopped midway. It can't help doing us good; it has begun to do us good already. It will make us young ones much more thoughtful and earnest, and so improve the country."

The diary stops before the year 1863, which was to be so important to her personally. In the spring she became engaged to Charles Russell Lowell. In July her brother was killed at the head of his Negro regiment at Fort Wagner. On October 31 she was married. The winter of 1863-4 she spent with her husband in camp at Vienna, Va. When in July, 1864, Colonel Lowell was ordered into more dangerous duty she returned to her father's home on Staten Island, and to her there in October came the news of her husband's death. There her daughter was born a few weeks later and there she lived until 1874, when she moved to the house in East Thirtieth street which was her home for most of the rest of her life.

It was not two years after her husband's death before Mrs. Lowell was actively identified with a committee of the Freedmen's Association, going to Virginia with Ellen Collins in the winter of 1866 to visit a number of the schools which had been established for colored children. Her more active public life, however, began with 1872. In that year the State Charities Aid Association took shape from the visiting committees for public charitable institutions which, under the leadership of Louisa Lee Schuyler, had been organized after the war to utilize for the permanent social problems in New York city and state, the interest and devotion and public spirit aroused by the temporary problems of the war. From the beginning Mrs. Lowell was one of the most active members of the association. She began, characteristically, by specializing on the Richmond county poor-house, near her home on Staten Island. In 1876 she was appointed by Governor Tilden to the State Board of Charities, being the first woman commissioner, and here she served for thirteen years. Out of her work on the State Board of Charities grew the Charity Organization Society which she founded in 1882, and to which she gave a large proportion of her time until her death.

The reforms which she had especially at heart and which she was especially influential in securing during the years from 1872 to 1890 were the fundamental and elementary ones of improving the almshouses, getting out of them the insane, the feeble-minded, the children, the vagrants, and giving decent care to the old and infirm who should remain; securing state reformatories for women and police matrons in New York city; providing state care in a custodial institution for feeble-minded women and improving the treatment of the insane.

When Mrs. Lowell withdrew from the State Board of Charities in 1889 it was in order that she might have time to give to the

problems of industrial conditions. In one personal letter at this time she says that what she wants to do "is, with others, to try to prevent strikes, by various means already successfully tried elsewhere, and here ignored by both employers and unions." In another letter she explains that she is impressed that the condition of 500,000 wage-earners is more vital than that of 25,000 dependents: "if the working people had all they ought to have, we should not have the paupers and criminals. . . . Exactly what I can do I do not know, but I want the time to try."

Some of the ways she did find in which to express this interest were in assisting the formation of the Working Women's Society, and later of the Consumers' League, of which she was the first president; organizing the East Side Emergency Relief Work in the winter of 1893-4; helping the sweated tailors in their strike in 1894; writing papers about arbitration and conciliation in industrial pursuits, and compiling a book on this subject; giving quick appreciation to the suggestion that the Charity Organization Society should enter into the field of housing reform by establishing a Tenement House Committee; and sympathizing with the broadening of its scope to include active work in other ways for the improvement of social conditions.

From 1894 on Mrs. Lowell spent no small part of her time in efforts to improve municipal politics. She organized the Woman's Municipal League to assist in the campaign for electing Mayor Strong, and in various addresses and publications enlisted the interest of women in good government. In 1894 also she first found time to give active attention to civil service reform, a subject which had been a latent interest since her girlhood, and which she furthered by forming a Women's Auxiliary to the Civil Service Reform Association, and by preparing a series of able papers and making many public addresses. The last paper she wrote, just before her death, was her report as chairman of the committee on Civil Service Reform of the State Federation of Women's Clubs.

This is by no means a complete list of her interests. For that, and for her way of looking at things, it is necessary to go to the book—to the letters and other writings which are there reproduced; to the bibliography of her reports and papers (a hundred and fifty or more) which fills ten of the large pages; to the tributes paid to her after her death.¹

One closes the volume wishing not only that there might have been more personal information about Mrs. Lowell herself, but also that more of her searching comments on friends and associates might have been included. The reasons for not including more of both are obvious and convincing; but this, for example, is the kind of observation which makes very entertaining reading: "Gertrude (a lady now prominent in the philanthropic work of New York) is a most satisfactory person to work with, very efficient and full of

¹See also the memorial volume published by the Charity Organization Society in 1906.

sense, and no personal feelings to interfere." And the following, from a letter dated early in 1885: "On the train coming from Albany Thursday, I had a long talk with Theodore Roosevelt about politics. He acknowledges that the best part of the Republican party supported Cleveland, and I think his reasons for voting for Blaine are rather mixed, but he is so young that he will get over the bad effect and will do good service yet. He said he couldn't help wishing he was 'in the fight' when he goes to Albany. . . . He is going to work in the State Charities Aid this winter and do some writing. He has quite a literary turn, you know."

THE WIDTH AND ARRANGEMENT OF STREETS. By CHARLES MULFORD ROBINSON. *The Engineering News*. Pp. 200. \$2.00; by mail of *THE SURVEY*, \$2.12.

To know this book thoroughly opens one's eyes in the highways and byways of towns and cities even more amazingly than to take a forest trail for the first time in company with one who knows woodcraft. The average city-dweller who reads it will be astonished to find out how very little he knows about the commonplace subject of streets. He will have once more a revelation of the importance and wealth of interest to be found in the commonplace. For the citizen who would take an intelligent interest in town planning, or who comes from any angle at the problem of improving the conditions of city life for the poor as well as for the better-to-do, the information and suggestions here put simply and concisely at his disposal are most valuable. The subject is approached from an analysis of the varied functions of streets. The folly of standardization as to width and other things is pointed out clearly. Constructively, the adaptation to serve the various functions is discussed with valuable concrete illustrations, particularly from the progressive work that is being done in England. The chapter on "excess condemnation" and other methods for financing street widening puts in a few pages the main points which most readers would have to search widely for, and applies with equal force, moreover, to other improvements along the line of fundamental city planning. The greatest value of the book is for those who are in a position to shape the development of the newer residence portions of our rapidly growing cities; but its information and spirit afford us all a point of view which until now has not been adequately expressed, and which is important not only for city planning but for all who concern themselves with community life.

TAXATION OF LAND VALUES IN AMERICAN CITIES. By BENJAMIN C. MARSH. Privately printed. Pp. 112. \$.75; by mail of *THE SURVEY*, \$.81.

Mr. Marsh's new book is really a brief for the bills introduced into the New York legislature last spring by Senator Sullivan and Assemblyman Shortt, providing for the gradual reduction of the rate of taxation on buildings until it shall be only one-half the rate on land. Mr. Marsh's interest in taxation is

indicated by his sub-title, the Next Step in Exterminating Poverty. He believes that "adequate taxation of land values will reduce the cost of living by twenty dollars per family up," and that it will lighten "many of the tasks of organized charity"; that it is the fundamental essential in dealing with congestion and bad housing conditions. Bolton Hall writes that no one can afford to ignore this book, because its arguments "will be thrown at us by our friends in conference and pounded into us by our opponents in debate."

THE LABOR QUESTION. By WASHINGTON GLADDEN. *The Pilgrim Press*. Pp. 209. \$.75; by mail of *THE SURVEY*, \$.82.

A good presentation of the fundamental principles of unionism, especially for the man who has known of labor problems only in a general way and may be puzzled about certain things, and especially for people in small towns and on farms, who through natural individualism and lack of contact with industrial conditions have been opposed to unionism. The different chapters originally appeared in the *Outlook* and have been brought together without any change in their pleasant, informal style. Dr. Gladden discusses both the evils and the advantages of unionism, reaching the conclusion that its evils are not inherent and that some form of it is absolutely necessary. He makes his strongest appeal in the final chapter, in which he urges the church to bear its share in bringing about justice in economic relations.

LABOR LAWS AND THEIR ENFORCEMENT. By CHARLES E. PERSONS, MABEL PARTON, MARIE MOSES, AND OTHERS. Edited by SUSAN W. KINGSBURY. Longmans, Green, and Company, Pp. 419. \$2.00; by mail of *THE SURVEY*, \$2.21.

This volume, although concerned chiefly with Massachusetts, comes nearer than anything else to rendering the service in America that the History of Factory Legislation, by Hutchins and Harrison, has rendered in England. The first part relates the early history of factory legislation in Massachusetts, which, since Massachusetts was the first state to enact factory laws of any importance, means the early history of factory legislation in America. Original documents have been consulted and quoted, so that for the first time the student has within easy reach the important records leading up to the final passage of the ten-hour law in 1874. There are also important chapters on the unregulated conditions in women's work; the weakness of the Massachusetts child labor law; a digest of the labor laws in Massachusetts; and a discussion of the standing of the state in the administration of its labor laws. The methods employed in testing the efficiency of administration are open to criticism, and the conclusions seem based on incomplete evidence; but so far as the evidence goes it would seem that Massachusetts can make little boast of having reached a resting-place in her attempt to protect the most defenceless portion of her citizenship from unjust labor conditions.

MISS 318. By RUPERT HUGHES. Fleming H. Revell Company. Pp. 128. \$.75; by mail of THE SURVEY \$.83.

In this story, which appeared last December in the *Saturday Evening Post*, the various kinds of exploitation involved in our observance of Christmas are personified in the members of two large families. "No. 318," the intelligent, resourceful, generous, and pathetic department store "saleslady," is the central character, but there is also an expressman, a "scrub-lady," chocolate-wrappers, paper-box makers, messenger boys, and cash girls, all victims of the Christmas rush. It may be inartistic to crowd these characters into two families living in the same house, but in spite of that the picture is impressive. Mrs. Kelley has said: "I wish that a million copies of this lively book might be given as Christmas presents this year."

THE COMMON GROWTH. By M. LOANE LOGGANS, Green, and Company. Pp. 304. \$2.00; by mail of THE SURVEY, \$2.10

Another discriminating and delightfully entertaining even if somewhat discursive account of the daily home life of the poorer portion of the working class of England is given by Miss Loane in *The Common Growth*. This visiting nurse has the ability to place before the reading public attractively the pith of the picturesque and pathetic incidents which she encounters in her daily work. The incidents which she gleanes from her service supply her with material which she interprets with considerable skill, for she is no mean psychologist, and from them she draws naturally and easily as morals of her tales some of the cardinal rules of modern relief work. Twenty-two independent chapters deal with such subjects as Hospitality, Working-Class Widows, Holidays, Looking Backward, The Question of Dress, Family, Socialism, and For Better or Worse. Most of these start with a short statement of fact or summary of the author's conclusions on the subject; but this introduction melts away into a series of delightful and often whimsical incidents, happenings, or stories that she has met with in her work. Some chapters, such as *A Woman Super-tramp*, consist entirely of the life story of one family. Others, like *Thomas Kirkup's Day's Work*, are interpretative and illustrative accounts of the life of a certain class in society. Thomas Kirkup is the four-year-old son of an agricultural laborer. The book as a whole deals more with the lot of the women and children than it does with that of men, which is natural in the record of what a visitor learned as she went from home to home, usually during the time when the father, if the woman was not a widow, was at work.

HERSELF: TALKS WITH WOMEN CONCERNING THEMSELVES. By E. B. LOWRY, M.D. Forbes and Company. Pp. 208. \$1.00; by mail of THE SURVEY, \$1.08.

Apparently these "talks" about the physiology and health and the duties of women were originally oral. In a book of this kind that is a recommendation, for it means that

they have been tried out. The language is simple and direct; as far as a layman can judge, the advice is good; the tone is sensible and wholesome.

GIRLS AND EDUCATION. By LE BARON R. BRIGGS. Houghton Mifflin Company. Pp. 162. \$1.00; by mail of THE SURVEY, \$1.07.

The president of Radcliffe knows how to make wholesome and sensible things seem the most attractive in the world, and these four addresses to girls in different circumstances would be helpful to most girls of sixteen or over and suggestive to those who have girls under their care.

HEREDITY. By WILLIAM E. CASTLE, Professor of Zoölogy, Harvard University. D. Appleton and Company. Pp. 180. \$1.50; by mail of THE SURVEY, \$1.61.

Professor Castle's photographs of successive generations of engaging guinea-pigs, who show in their own coats exactly the proper distribution of blackness and whiteness, roughness and smoothness, required by Mendel's law of inheritance, will probably make that law a reality to many who have thought of it, if they have thought of it at all, as a mathematical or philosophical hypothesis. The text, moreover, is as clear and careful as possible, and can be followed with interest as well as profit by the general reader who is willing to make a moderate intellectual exertion. While Professor Castle had in mind principally the application of scientific knowledge to the production of new and improved breeds of animals and plants, the full title of his book being *Heredity in Relation to Evolution and Animal Breeding*, the same scientific knowledge is of importance in connection with certain social policies, and the reader whose interest is in social problems can make his own applications.

MANUAL OF PSYCHIATRY. By J. ROGUES DE FURSAC, M.D. Translated and edited by A. J. ROSANOFF, M.D., second assistant physician, Kings Park State Hospital, N. Y. John Wiley and Sons. Pp. 484. \$2.50; by mail of THE SURVEY, \$2.65.

The third American edition of this standard manual has increased interest, for those whose concern is with the social aspects of mental disorders, because of new sections, added by the editor, on the topics of race psychopathology, the relation of the Mendelian laws to heredity in insanity, the influence of parental alcoholism on offspring, and the prevention of insanity and hygiene of the mind. The original introductory chapter, with the additions which have been made to it, is an excellent summary of the research that has been made, and the conclusions that have thus far been reached, as to the causes of mental diseases. A curious instance of aberration is offered by an English catalogue which classifies this book under the head "Occultism."

INFLUENCES OF GEOGRAPHIC ENVIRONMENT. By ELLEN CHURCHILL SEMPLE. Henry Holt and Company. Pp. 683. \$4.00; by mail of THE SURVEY, \$4.25.

Miss Semple expected, when she began work on this book over seven years ago, to

make it merely a simplified paraphrase of Friedrich Ratzel's *Anthropo-Geographie*, which "is difficult reading even for Germans," and which the author himself realized "must be adapted to the Anglo-Celtic and especially to the Anglo-American mind." She modified her plan materially, however, and while her book is "on the basis of Ratzel's system" it represents an immense amount of research on her own part to test and verify her master's conclusions, to fill up gaps in his treatment, and to eliminate the influence of repudiated theories. The resulting volume is in no sense a popular one. It is a deeply serious and wide-embracing treatise which no student of the influence of the earth upon man can afford to overlook.

MEN WANTED. By FRED B. SMITH. Association Press, New York. Pp. 223. \$.75; by mail of THE SURVEY, \$.83.

Mr. Smith has been for some years the secretary of the Religious Work Department of the International Committee of Young Men's Christian Associations, and he is now the campaign leader of the Men and Religion Forward Movement. His book, which is certain to be an important part of the campaign literature of this movement, has grown out of his past experience. It gives, in a word, his conception of the kind of men who are "wanted": men who rightly appreciate work, who are honest and loyal, who have initiative and perseverance, and who are truly religious.

THROUGH THE MILL. By "AL PRIDDY." The Pilgrim Press. Pp. 304. \$1.35; by mail of THE SURVEY, \$1.50.

This is a graphic recital of the experience of a mill boy from the time he was eleven years old until, as a young man of about eighteen, he suddenly broke away and went to a middle western college. There is no attempt at dramatic effect; and the author seems almost devoid of a sense of humor, and also of any clear appreciation of the great awakening known as the "labor movement." It is the absence of these qualities which contributes more than anything else to an impression that the story is genuine and that it presents precisely the point of view the child laborer would have.

THOUGHT AND FACT FOR TO-DAY. By CLAY MACCAULEY. Kelly and Walsh, Limited, Yokohama, Shanghai, Hongkong, Singapore. Pp. 95. \$.40; by mail of THE SURVEY, \$.45.

A plea for world-peace, within nations and among nations.

PROCEEDINGS OF THE THIRD NATIONAL CONFERENCE ON CITY PLANNING, MAY 15-17, 1911. Pp. 293. \$1.50; by mail of THE SURVEY, \$1.62.

See THE SURVEY, June 3, 1911, for review of the conference.

THE SPIRIT OF SOCIAL WORK. By EDWARD T. DEVINE. Charltes Publication Committee. Pp. 240. By mail of THE SURVEY, \$1.00.

For the dedication "To social workers" and a list of contents, see the advertisement facing page 1266, in THE SURVEY for November 25.

TWENTY YEARS AT HULL HOUSE. By JANE ADDAMS. The Macmillan Company, Sixth edition. Pp. 460. \$2.50; by mail of THE SURVEY, \$2.50.

Miss Addams's autobiography has run into six editions in a year, besides large sales of a special edition in the Chautauqua courses last summer. It is the "best seller" of books for social workers, ranking in popularity with the volumes which made Jacob Riis known in every village in the country.

HYGIENE AND MORALITY. By LAVINIA L. DOCK. G. P. Putnam's Sons. Third edition. Pp. 200. \$1.25; by mail of THE SURVEY, \$1.35.

Four thousand copies of Miss Dock's book on the causes and consequences of the social evil have been sold. The *Woman Voter* announces that Miss Dock has given her royalties to the woman suffrage movement.

AN AMERICAN RAILROAD BUILDER: JOHN MURRAY FORBES. By HENRY GREENLEAF PEARSON. Houghton Mifflin Company. Pp. 196. \$1.25; by mail of THE SURVEY, \$1.37.

The story of the man who, having made a fortune in China before he was twenty-five, became the builder of the Michigan Central and the Chicago, Burlington, and Quincy railroads. He stood for honest railroading in the era of the Erie raids and the Credit Mobilier scandals.

THE MAN WHO LIKES MEXICO. By WALLACE GILLPATRICK. The Century Company. Pp. 374. \$2.00; by mail of THE SURVEY, \$2.19.

A lively and well illustrated narrative by a leisurely traveller, who was less interested in politics at the capital than in the people of Mexico. He has as keen eyes for both the good and the bad in the Mexican peon as he had for the boys of New York's East Side when he was headworker of Chrystie Street House.

FOUR MONTHS AFOOT IN SPAIN. By HARRY A. FRANK. The Century Company. Pp. 370. \$2.00; by mail of THE SURVEY, \$2.18.

Another entertaining book by the young man who, supplied with one hundred dollars, a camera, a working knowledge of many tongues, and a pair of sturdy legs, made a Vagabond Journey Around the World. The trip to Spain covered two thousand miles by third-class rail and one thousand by foot and cost \$172. This traveller has a faculty for getting close to the people in city nooks and remote villages.

THE TRUTH ABOUT AN AUTHOR. By ARNOLD BENNETT. George H. Doran Company. Pp. 154. \$1.00; by mail of THE SURVEY, \$1.08.

Whether or not this is the truth, meaning the whole truth and nothing but the truth, about this particular author, at any rate it might be and it is extremely entertaining. Any one who has ever tried to write for publication in the humblest way, as well as those who are in the midst of "the bright auctorial career," will find in it statements that are stimulating or suggestive or consoling. For example: "I have come to the conclusion that the chief characteristic of all bad reviewing is the absence of genuine conviction."

THE TREND OF THINGS

A dozen magazines, of all kinds, from religious to "popular," have given THE SURVEY a glimpse into their plans for 1912, and the tables of contents presented show that matters of social importance are counted upon today to hold both religious and secular readers.

Of the general magazines, the *Century*, *Lippincott's*, *McClure's*, the *Atlantic*, and the *American* have plans to announce. In the *Century*, Edward Alsworth Ross will have a series on the social, political, educational, and other traits which make the Middle West distinctive, and Clayton Sedgewick Cooper, who has before this written on college conditions, will offer five studies of the life and character of the American under-graduate. Two articles on race questions are promised by *Lippincott's*: Passports for Alien Women, by Alexander Otis, and Indian Traits, by Charles Warren Currier. *Lippincott's*, too, offers articles by Forbes Lindsay on conditions in Cuba and Panama.

* * *

Another tropical or semi-tropical country is described by Ray Stannard Baker in the *American*. This is Hawaii, whose sugar industry, developed and controlled by white men, many of them descendants of missionaries, dominates the life of the island. In the *American* will appear also Ida M. Tarbell's studies of the "woman question," and La Follette's autobiography. The striking feature of *McClure's* for the year is Jane Addams's series, *An Ancient Evil and a New Conscience*. *Today's Magazine*, a Middle West periodical published at Canton, O., offers, besides single articles, a series on various social movements by Constance D. Leupp. The *Atlantic* offers a wide and interesting choice, including:

The Abolition of Poverty, by Jacob L. Hollander.
English and American Democracy, by L. T. Hobhouse.

An American Town, by Randolph S. Bourne.
The Third Dimension of Land Tenure, by William D. Parkinson.

Home Rule at Last, by Edward Porritt.
Non-restraint and Insanity, by Charles Whitney Page.

The Real Reason for the Small Family, by W. S. Rossiter.

* * *

Country Life in America proposes to continue its last year's series, *Cutting Loose from the City*. These true stories by people who for health, happiness, or some other reason have given up city life and work, and actually succeeded in making a living from the soil, have attracted so much attention and apparently inspired so much confidence in the matter as to make timid ones go and do likewise. It is evident that they meet a real need. "The number of letters that we have received," says the managing editor, "leads us to think that it appeals to a numerous class of city people and therefore represents a real, widespread sentiment that amounts almost to a movement."

December 9, 1911.

Through the columns of the *Congregationalist*, one of the most influential religious papers in America, Al Priddy will present a study of the factory workers' struggle for character, to which his personal narrative, *Through the Mill*, as published in the *Outlook*, was a picturesque introduction.

* * *

L. M. Montgomery, a Chicago settlement worker, will present a cross-section of life in her stories of the tenements. The *Continental*, a Presbyterian publication, will offer a series of articles on social matters by Mary E. McDowell, headworker in the Chicago University settlement, and a study of social and religious conditions in the South by its field editor, William T. Ellis; these will be supplemented by an article on race prejudice and Christianity by Edward A. Steiner.

* * *

The *Outlook* will take up those aspects of social conditions which find expression in the political situation in a series of preëlection statements by representatives of different political groups—among them La Follette, Taft, Harmon, Bryan, and Woodrow Wilson. To a subject today closely allied with the political situation, namely, business conditions, Francis E. Leupp will devote a series based on answers, by representatives of business, of labor, and of the United States Treasury, to the question, "What's the Matter with Business?"

* * *

The *Woman's Journal*, pioneer publication of the suffrage movement, offers some twenty articles which will be published after their appearance in the *Journal* as pamphlets in answer to the question, "What Will Women do with the Ballot?" Those already arranged for are Fire Prevention, by Arthur E. MacFarland, the Abolition of Child Labor, by Mrs. Florence Kelley, Reasonable Postal Laws, by James S. Cowles, and the Abolition of the White Slave Traffic, by Clifford E. Roe. W. E. Burghardt du Bois, Rheta C. Dorr, and others will contribute articles specifically on the franchise.

Good Housekeeping, another "woman's journal," and a progressive in household technique, will offer a series on health, by Woods Hutchinson, and will continue its series on sex hygiene with articles by Felix Adler, G. Stanley Hall, Prince A. Morrow, and Maude E. Miner.

* * *

The *School Review* (University of Chicago) shows, by the choice of articles it offers, how wide is the scope of education. Here are six:

The Disintegration of a High-School Class: by Freeman E. Lurton, superintendent of schools, Anoka, Minn.

Salesmanship in the High School of Commerce: by Leonard B. Moulton, Boston High School of Commerce.

The Humanities and Modern Education; by William Gardner Hale, professor and head of the Department of Latin, University of Chicago.

The Last Vestige of Puritanism in the Public Schools of Massachusetts; by J. M. Andress, Instructor in School Hygiene and Psychology, State Normal, Worcester, Mass.

Some Aspects of the Child Welfare Problem in the High School; by Benjamin C. Gruenberg, Commercial High School, Brooklyn.

L'Ecole des Roches; by Henri Marty, professor at the Ecole des Roches, Verneuil, France.

* * *

Among the juvenile publications the *Youth's Companion* is striking out into many subjects of social importance. The Boy Scouts will be described by their founder, General Baden-Powell; Governor Harmon will contribute a succinct and interesting outline of the functions of a governor; and Jacob A. Riis will tell little stories, grave and gay, of the Big Brother movement. Frank W. Leavitt will write in behalf of vocational education, taking the ground that our present method of education, in trying to fit all for something better than industrial work, leaves many fit for nothing else. E. Dana Durand, director of the census, will analyze the incomes of American families; and W. T. Stead will write on great men, the greatest in point of impressing his character and ideas on his generation being, in his estimation, none other than General Booth, founder of the Salvation Army.

* * *

The Christmas-Peace Number of the *World's Work* contains a symposium setting forth the opinions on world peace of great men from many countries. In addition, Simon N. Patten writes of the World's Peace in the Making, showing how the calculating (economic) man of today finds war against his interests. Norman Angell brings the Great Illusion in regard to the economic need for war up to date with the striking illustration of a financial crisis in Germany following automatically on that nation's indication of a warlike attitude toward France, and President Taft writes on the arbitration treaties. The symposium ends with a prophesy from Maarten Maartens which hits off a thought that is in the minds of many: "The promise of the future is manifestly less war between nation and nation, more war between class and class."

* * *

In the November *Painter and Decorator*, organ of the union of these trades, Charles R. Brown sums up the disintegrating effect of child labor on mental development and character: "The boy," says Mr. Brown, "who is thrust too soon into the factory among whirling machinery where he must look sharp or get hurt, or upon the street as a newsboy or other street vender, may gain rapidly a certain alertness and shrewdness. But the unnatural excitement and nervous irritation are bad for him. He needs the wholesome unfolding in the quiet hours of the schoolroom and the joyous hours of the playground. Under the abnormal stimulus, when he is forty years old, and should be in the

glory of his early prime, he is apt to be nervously broken down and worn out. The boy or girl compelled to monotonous work in the mill feels himself ill-used by society. He develops the anti-social spirit which is good soil in which to sow seeds of lawlessness and crime. Denied the wholesome recreations which belong to adolescence he is apt, when released at night from the grind of toil, to enter readily upon those forms of vicious indulgence which are most accessible."

* * *

In its last three issues the *Gospel of the Kingdom* (American Institute of Social Service) is addressing itself to its task of applied Christianity by spreading knowledge of unsanitary occupations and conditions. Sanitation and Hygiene is the subject of the second (November) studies, tuberculosis of the December studies, together with the discussion of protection against fire by drill, the latter a signed article by H. F. G. Porter.

* * *

The *Holiday Bulletin* of the National Fire Protection Association, 87 Milk street, Boston, is a series of precautions and "do not's," warning stores, churches, and homes against a "mercantile sacrifice to Christmas decorations." The leaflet is simple and effective and should be spread widely. Copies can be obtained from the association at ten dollars per thousand.

Here is the pith of the pamphlet:

WARNINGS FOR STORES, CHURCHES, AND BAZAARS.

Holiday fires in these while filled with people are usually holocausts.

Light, inflammable decorations makes fires easy to start and easy to spread. A match, a gas flame, or an electrical defect may do it.

Watch gas jets! Decorations may be carried against them by air currents.

Watch smokers! Do not permit them to light cigars inside buildings.

Do not make the slightest change in electric wiring without consulting electrical inspector.

WARNINGS FOR THE HOME.

Every year in America many children are burned to death by fire from Christmas candles.

Do not decorate your Christmas tree with paper, cotton, or any other inflammable material.

Use metallic tinsel and other non-inflammable decorations only, and set the tree securely so that the children in reaching for things cannot tip it over.

Do not use cotton to represent snow. If you must have snow use asbestos fiber.

Do not permit children to light or relight the candles while parents are not present. They frequently set fire to their clothing instead. The tree itself will burn when needles have become dry.

Do not leave matches within reach of children at Holiday time. Candles are meant to be lighted, and if the children can get matches they will experiment with them. They imitate their elders.

THE 1911 CHRISTMAS SEALS.

Few people have any conception of the magnitude of the Red Cross Christmas Seal Campaign. Already 85,000,000 seals have been printed, and practically that entire number distributed to agents. Probably 15,000,000 more will be needed. Advertising circulars, posters, cards, etc., to the number of several million, have also been distributed. It is estimated that the army of paid and volunteer workers engaged in selling the seals will number over 100,000. The advertising and publicity donated to the campaign will amount to several hundred thousand dollars. Every effort is being put forth to sell 100,000,000 seals, or about one for every man, woman, and child in the United States. Spencer H. Miller, a ten-year-old boy of Meriden, Conn., has sold, single-handed, 50,000 Red Cross seals, establishing a record for individual sales. Prizes valued at over \$100,000 are being given in various parts of the country for selling Red Cross seals. These prizes consist of vacuum cleaners, pianos, drinking fountains, books, and a variety of other articles, down to a button bearing the Red Cross seal.

CALENDAR OF CONFERENCES

DECEMBER CONFERENCES.

- Dec. 12, 1911. *Council of Jewish Women*.—Philadelphia, Pa. Executive Secretary, Sadie American, 448 Central Park West, New York city.
- Dec. 13-15 *American Civic Association*.—Washington, D. C. Secretary, Richard B. Watrous, 914 Union Trust Bldg., Washington, D. C.
- Dec. 27-30 *American Economic Association*.—Washington, D. C. Secretary, Prof. T. N. Carver, Harvard University, Cambridge, Mass.
- Dec. 27-30 *American Sociological Society*.—Washington, D. C. Secretary, Alvan A. Tenney, Columbia University, New York city.
- Dec. 27-30 *American Political Science Association*.—Buffalo and Toronto (Dec. 30), Secretary, W. W. Willoughby, Johns Hopkins University, Baltimore, Md.
- Dec. 27-30 *American Historical Association*.—Buffalo, N. Y. Secretary, W. G. Leland, 500 Bond Bldg., Washington, D. C.
- Dec. 27-30 *American Association for Labor Legislation*.—Washington, D. C. Secretary, John B. Andrews, 1 Madison Ave., New York city.
- Dec. 27-30 *American Statistical Society*.—Washington, D. C. Secretary, Carrol W. Doten, 491 Boylston St., Boston, Mass.
- Dec. 27-30 *American Association for the Advancement of Science*, Section I on Social and Economic Science. Secretary of Section I, J. Pease Morton, Yale University, New Haven, Conn.

LATER MEETINGS.

International.

- Feb. 19-24, 1912 *Pan-Pacific Congress*.—Honolulu, Hawaii. Secretary, H. P. Wood, Honolulu, Hawaii.
- Sept. 4-13, 1912 *Chemistry, Applied*.—Congress on Washington, September 4, and New York, September 6-13. Secretary, Bernard C. Hesse, M. D., 25 Broad street, New York city.
- Sept. 23-28, 1912 *Hygiene and Demography*.—Fifteenth Congress on. Washington, D. C. Secretary, Dr. John S. Fulton, Army Medical Museum, Washington, D. C.
- Sept., 1912 *Labor Legislation*.—Association for, Zurich, Switzerland. Secretary, Stephen Bauer, Basel, Switzerland.
- 1913 *Fight Against Unemployment*.—International Association for. Ghent, Belgium. American corresponding officer, J. B. Andrews, 1 Madison Ave., New York city.
- 1915 *Prison—Quinquennial Congress*. London, England. Secretary, F. Simon Van der Aa, Groningen, Holland.

- 1915 *Relief*.—Committee on Public and Private. London, England. Secretary, Charles S. Loch, Charity Organization Society, London.

National.

- Jan. 19-20, 1912 *National Consumers' League*.—New Haven, Conn. Secretary, Mrs. Florence Kelley, 105 E. 22nd street, New York city.
- Jan. 25-28, 1912 *National Child Labor Committee*.—Louisville, Ky. General secretary, Owen R. Lovejoy, 105 E. 22nd street, New York city.
- March 12-14, 1912 *Religious Education Association*.—St. Louis, Mo. General secretary, Henry F. Cope, 332 South Michigan ave., Chicago, Ill.
- June, 1912. *National Probation Association*.—Cleveland, O. Secretary, Arthur W. Towne, The Capitol, Albany, N. Y.
- June 9-12, 1912 *National Conference of Jewish Charities*. Cleveland, O. Secretary, Rose Sommerfield, 225 E. 63rd street, New York city.
- June 25-July 8, 1912 *Women's Clubs*.—General Federation of, San Francisco, Cal. Corresponding Secretary, Mrs. Frank Shiek, Wheatland, Wyo.
- Sept., 1912 *Catholic Charities*.—National Conference of, Washington, D. C. Secretary, Rev. Dr. William J. Kerby, Catholic University, Washington, D. C.

State and Local.

- Jan. 15, 1912. *Colorado Association for the Prevention and Control of Tuberculosis*.—Denver, Colo. Secretary, S. Poulter Morris, State House, Denver, Colo.
- Jan. 25, 1912 *New York Peace Society*.—Hotel Astor, New York city. Corresponding officer, William H. Short, 507 Fifth Ave., New York city.
- Jan., 1912 *Nebraska Conference of Charities and Correction*.—Omaha, Neb. Secretary, Ida V. Jontz, City Hall, Omaha, Neb.
- April, 1912. *New Hampshire Conference of Charities and Correction*.—Place not chosen. Secretary, Mrs. James W. Romick, 80 School St., Concord, N. H.
- April 3-4 1912. *American Academy of Medicine*.—Lehigh University, South Bethlehem, Pa. Secretary, Charles McIntire, M. D., Easton, Pa.
- Autumn, 1912 *Massachusetts State Conference of Charities and Correction*.—Secretary, Parker B. Field, 229 Tremont street, Boston, Mass.
- Oct. 29, 1912 *Massachusetts No-Licence League*.—sixth annual conference. Boston, Mass. Secretary, Robert H. Magwood, 310 Equitable Bldg., Boston, Mass.

Classified Advertisements

ADVERTISING RATES ARE: "Want advertisements," under the various headings, "Situations Wanted," "Help Wanted," etc., five cents for each word or initial, including the address, for each insertion. The first word of each advertisement is set in capital letters without additional charge. Other words may be set in capitals, if desired, at double rates. Replies will be forwarded by us to the advertiser.

Orders and copy for Classified Advertisements must be received with remittance ten days before the Saturday on which it is intended the advertisement shall appear. Address Advertising Department, THE SURVEY, 105 East 22nd St., New York City.

HELP WANTED

Cottage Mothers

Wanted: Jewish women of culture and refinement, twenty-five to thirty-five years of age, as cottage mothers for the HEBREW SHELTERING GUARDIAN ORPHAN ASYLUM OF NEW YORK. The new cottage home institution is situated in Pleasantville at a distance of one hour from New York City; forty trains daily. Training course for cottage mothers commences March 1st, 1912, for six weeks, during which period trainees will receive full compensation. Good salary and splendid opportunity for constructive social work. Apply in writing to Dr. L. B. Bernstein, Superintendent, Broadway and 150th Street, New York City.

PUBLICITY and membership secretary wanted by national organization with headquarters in New York. Good salary, interesting work. Write, giving experience and references, to J. B., c/o SURVEY.

AN Experienced worker to fill the position of probation officer at the Juvenile Court Answer P. O. X. Y. Z., Irvington-on-Hudson, N. Y.

SITUATIONS WANTED

Domestic

HIGH school student, Jewess, desires position with family, Jewish or Gentile, as domestic servant, out of school hours in exchange for board and room. Willing: Exceptional ability: Highest personal references. Address E. D., 39 Pierrepont St., Brooklyn.

SOCIAL WORKER, young woman with six years' experience, desires position in Chicago. Address D. H. O., c/o SURVEY.

YOUNG man of ability and education wishes responsible executive or investigative position. Has investigated various child problems,—amusements, labor, milk stations, etc. in N. Y. City and State. Is thoroughly capable of organizing and directing new work. Social Worker, c/o. The Survey.

INFORMATION DESK

The following national bodies will gladly and freely supply information and advise reading on the subjects named by each and on related subjects. Members are kept closely in touch with the work which each organization is doing, but membership is not required of those seeking information. Correspondence is invited. Always enclose postage for reply. *Continued on next page.*

Child Labor

National Child Labor Committee, 105 East 22d St., New York. Owen R. Lovejoy, Sec'y. 25 State Branches. Where does your state stand? How can you help? List of pamphlets and reports free. Membership fee nominal.

Child Helping

Department of Child-Helping, Russell Sage Foundation, 105 East 22d St., New York.

Correspondence and printed matter relative to institutions for children, child placing, infant mortality, care of crippled children, Juvenile Courts, etc.

Recreation

Playground and Recreation Association of America, 1 Madison Ave., New York City. Howard S. Braucher, Sec'y.

Play, playgrounds, public recreation. Monthly magazine. *The Playground*, \$2 a year.

Children

National Conference on the Education of Dependent, Backward, Truant, and Delinquent Children. Conference reports \$1 each, including membership in conference. Address Elmer L. Coffeen, Sec'y and Treas., Westboro, Mass.

Recreation

Dept. of Child Hygiene of the Russell Sage Foundation, 400 Metropolitan Tower, New York City. Lee F. Hamner, Associate Director, Division of Recreation.

Research and the promotion of activities favorable to the physical and social welfare of young people.

Probation

National Probation Association. The Capitol, Albany, N. Y. Arthur W. Towne, Sec'y.

Advice and information; literature; directory of probation officers; annual conference. Membership, 50 cents a year.

National Health

Committee of One Hundred on National Health. E. F. Robbins, Executive Secretary, Room 51, 105 East 22d St., New York.

To unite all the government health agencies into a National Department of Health to inform the people how to prevent disease.

Tuberculosis

National Association for the Study and Prevention of Tuberculosis, 105 East 22d St., New York. Livingston Farrand, M. D., Exec. Sec'y. Reports, pamphlets, etc., will be sent upon request. Annual Transactions and other publications free to members.

Sex Hygiene

American Society of Sanitary and Moral Prophylaxis, 29-33 W. 42d St., New York. H. P. DeForest, Sec'y 18 affiliated societies.

Report and leaflets free. Educational pamphlets, 10c each. *Journal of Social Diseases*, \$1 per year. Membership, annual dues \$2, includes all literature.

School Hygiene

American School Hygiene Association. Pres., David L. Edsall, M. D., Washington University; Sec'y., Thomas A. Storey, M. D., College of the City of New York, New York.

Yearly congresses and proceedings.

Mental Hygiene

National Committee for Mental Hygiene, 39 Church Street, New Haven, Conn., (Clifford W. Beers, Sec'y). Write for pamphlets on mental hygiene, prevention of insanity, care of the insane, social service in mental hygiene. State Societies for Mental Hygiene.

Working Women

National Women's Trade Union League, 127 N. Dearborn St., Chicago. Mrs. Raymond Robins, President.

Information gladly given. Official publication, *Life and Labor*, three months' subscription, 25c.

Women in Industry

National Consumers' League, 105 East 22d St., New York. Mrs. Florence Kelley, Sec'y. Annual Report and other literature free. Minimum wage boards, protection of women workers, pure food, sweatshops, etc.

Labor Legislation

Workers' Compensation; industrial hygiene; Labor Laws.

Official publication: *American Labor Legislation Review*, sent free to members.

American Association for Labor Legislation, Metropolitan Tower, New York City. John B. Andrews, Secretary.

White Slave Traffic

National Vigilance Committee, 156 Fifth Ave., N. Y. Information as to the traffic acted on. Special library for free use. Publishes *Vigilance* monthly, 50c. a year. Book on White Slave Traffic, \$1.

Young Women

National Board, Y. W. C. A., 125 East 27th St., New York City. Pres., Miss Grace H. Dodge. Gen. Sec'y., Miss Mabel Cratty; the advancement of physical, social, intellectual and spiritual interests of young women. Official Publication, "The Association Monthly" \$1; free literature.

Remedial Loans

National Federation of Remedial Loan Associations, 105 E. 22d St., N. Y. Arthur H. Ham.

Reports, pamphlets, and forms for societies free. Information regarding organization of remedial loan societies gladly given.

Prison Labor

National Committee on Prison Labor, 27 E. 22d St., N. Y. City. Thomas R. Slicer, Chn.; E. Stagg Whitin, Ph.D., Gen. Sec.; R. Montgomery Schell, Treas. Prison labor conditions throughout the U. S. examined with recommendations for constructive reform. Pamphlets free to members. \$5 a year.

Delinquents and Prison Reform

National Prisoners' Aid Society, 135 East 15th St., New York City. O. F. Lewis, Sec'y. Membership, \$1 annually, including monthly sixteen page magazine *The Review*, a digest of the field of delinquency. Parole, prisons, probation, vagrancy, farm colonies, prison labor, etc.

Short Ballot and Commission Government

The Short Ballot Organization, 383 Fourth Ave., New York City. Woodrow Wilson, President; Richard S. Childs, Sec'y. National clearing house for information on these subjects. Pamphlets free. Publishers of *Beard's Loose-Leaf Digest of Short Ballot Charters*.

Municipal Problems

National Municipal League, 703 North American Bldg., Philadelphia. William Dudley Foulke, Pres.; Clinton Rogers Woodruff, Sec'y. Charters, commission government, taxation, police, liquor, electoral reform, finances, accounting, efficiency, civic education, franchises, school extension.

Civic Improvement

AMERICAN CIVIC ASSOCIATION, Union Trust Building, Washington, D. C. J. Horace McFarland, Pres.; Richard B. Watrous, Sec'y. Parks; Recreation Centers; Bill-board, Smoke, and Fly Nuisances; Preservation of Scenic Wonders.

City Planning

National City Planning Conference, 19 Congress St., Boston, Mass. Frederick Law Olmsted, President. Flavel Shurtleff, Secretary. A Seminar for the Discussion of City Planning Problems. Publishes Annual Proceedings. Membership at \$5 a Year Includes All Literature.

THE COMMON WELFARE

ATTACK ILLINOIS TEN-HOUR LAW

The Illinois ten-hour law for working women is again being attacked. After the bitter struggle immediately following the first enforcement of the law, in which the whole strength and influence of the Illinois Manufacturers' Association was exerted to disprove the law's constitutionality, it was supposed that this question was permanently settled. The arguments at that time on behalf of the law were made by W. J. Calhoun, now minister to China, and by Louis Brandies, whose brief for the case attracted nation-wide attention.

The present attack comes from interests brought within the scope of the law by the amendments enacted at the last session of the Illinois legislature. These include hotels, restaurants, telegraph and telephone offices, places of amusement, persons, firms, or corporations engaged in express or transportation or public-utility business, common carriers or public institutions.

The proprietor of a hotel in Charleston, backed by the Hotel Men's Association of the town, filed a bill for an injunction to restrain the enforcement of the law so far as it applies to women employed in hotels. Judge J. C. Harrah refused to issue the writ and the matter was taken directly to the Supreme Court of the state. December 5 was set as the last day on which briefs

might be filed, but Attorney-general Stead secured an extension of time. At his invitation, and through the co-operation of the Women's Trade Union League and the Illinois Association for Labor Legislation, outside counsel has been secured to assist in the defence of the law, Edgar A. Bancroft, of Chicago, consenting to act as such.

The brief filed by the hotel men is said to contend that kitchen work is not arduous, and it is cited that women on farms are employed sixteen hours a day and rear healthy children. The supporters of the law feel sure that the arguments on which the Supreme Court sustained the constitutionality of the law—that long hours of labor for women affect injuriously the mothers of future generations and that society has a right to protect them—will prove equally convincing in the present case.

One hundred thousand leaflets explaining the law have been distributed by the Women's Trade Union League in its efforts to inform working women as to the conditions which the law declares should prevail. The amendment covers mercantile establishments as well as the industries above mentioned. Especial effort is therefore being made to secure its strict enforcement in department stores during the holiday rush. The situation in the Chicago department stores is being watched by the state factory inspector, and already viola-

tions are being reported. The co-operation of the general public throughout the state, but especially in Chicago, is sought by the Women's Trade Union League. Christmas shoppers are urged to make inquiries and report any cases in which girls or women are employed more than ten hours in each twenty-four.¹

THE SETTLEMENT MOVEMENT A QUARTER-CENTURY OLD

Last week saw the celebration of the twenty-fifth anniversary of the launching of the settlement movement in this country. When Dr. Stanton Coit, stimulated by a short residence in Toynbee Hall, took up quarters in August of 1886 in a Forsyth street tenement, he had no notion that twenty-five years would see the beginnings of over 400 similar ventures in America. Yet when one listened to Felix Adler, Hugo Münsterberg, Jane Addams, and others who gathered to commemorate the founding of the University Settlement, the inevitability of its spread was not far to see. From Dr. Coit's settling on the east side grew the Neighborhood Guild the year following. In 1891 this was reorganized as the University Settlement Society.

That the settlement represents a "quarter of a century's successful prosecution of a sound idea" was the way Nicholas Murray Butler, president of Columbia University, put it. Dr. Adler suggested that the settlement might find its chief task that of uniting social classes in a closer harmony. In this performance its work would be that of interpreting to each the needs, capacities, and modes of life of the others. He hoped that the settlement may more abundantly as the years go by become in truth the "House of the Interpreter." Miss Addams recalled the early days of the settlements, when college students used to come wanting to help some individual in need. Then they came wanting to investigate something. Now they do not come in such numbers as formerly. This, she thinks, is partly due to

the student volunteer movement, and partly to the view that the settlement has become an established, conservative influence in city life, no longer so attractive as before to ardent youth with path-finding ideals. Professor Münsterberg declared that the time has come for the philanthropist to grasp the facts and laws of the mind. Our psychological laboratories have turned in recent days with new vigor, he said, to problems of life. Yet the social worker, untrained in psychology, is often our chief reliance, through his vision and sympathy in interpreting the needs, ambitions, and fears of those with whom his work brings him into contact. Other speakers were Seth Low, first president of the University Settlement, Henry W. Taft, and Herbert Parsons. A settlement near Central Park for the purpose none other than that of studying conditions among the rich was suggested by James Speyer, treasurer of University Settlement, who said:

Perhaps workers there would find that while the east side families are too large the uptown families are too small for real happiness, and that while the east side boy and girl get into trouble because they do not have enough opportunity for play and amusement the uptown boy and girl get into trouble because they have too much of such opportunity. Perhaps also they would find that while the east side boy is too much in the streets the uptown boy is not enough in the street and does not learn to appreciate other boys.

FIRST BOARD NAMED FOR FARM COLONY

The make-up of the board of managers of the first farm colony in America for tramps and vagrants was announced November 29 by Governor John A. Dix of New York, just four months to a day after the act creating the board received his signature². Upon this board falls the pioneer task of justifying an experiment in dealing with a costly and numerous class of delinquents along lines which have been demonstrably useful in several foreign countries, notably in Holland, Belgium, and Switzerland. The work at Witzwil, a penal farm in the canton Berne, was described by Prof. Frank A. Fetter in *THE SURVEY* for Feb-

¹Information as to such violations may be sent to the Women's Trade Union League, 331 S. La Salle street, Chicago, or to the state factory inspector, Security Building, Madison street and 4th avenue, Chicago.

²See *THE SURVEY* for April 9, 1910.

ruary 4 last. The new board consists of Orlando F. Lewis, secretary Prison Association of New York, who made a special study of the European farm colonies during the past summer; Judge Joseph Beal, attorney, Oneida, N. Y.; George F. Warren, State College of Agriculture, Cornell University; Samuel Untermyer, attorney, New York city; Frederic Almy, secretary Charity Organization Society, Buffalo, N. Y.; Michael J. Drummond, commissioner of public charities, New York city; John G. O'Keeffe, retired banker, director Catholic Home Bureau, New York city.

The legislative campaign leading up to the passage of the bill was conducted largely by the joint committee of the Charity Organization Society and the Association for Improving the Condition of the Poor, composed of Johnston deForest, chairman, W. Frank Persons, John A. Kingsbury, Charles E. Merrill, Jr., Robert Shaw Minturn, Leonard E. Opdycke, and Charles K. Blatchly, secretary. Mr. Blatchly had charge of the aggressive publicity work carried on.

The board is empowered by the act creating it to select a site (under approval of the governor) of not less than 500 acres, the purchase price not to exceed \$60,000. Such action must be reported to the Legislature not later than March 1, 1912. It has been estimated that twenty thousand tramps and vagrants cost the commonwealth of New York \$2,000,000 annually. This, it is pointed out, however, is but the financial expression of a distinct problem of human conservation which, left to local and fragmentary treatment, has led to bitter waste.

MAJOR MEETINGS OF THE HOLIDAYS

The American Economic and the American Sociological Societies, the American Statistical Association, the Association for the Advancement of Science (Section I, on Social and Economic Science), and the American Association for Labor Legislation are all to meet this year at Washington, from December 27 to December 30. On these same dates the American Historical Association and

the American Political Science Association will be holding a joint meeting at Buffalo. The American Economic Association will hold the majority of its sessions in conjunction with the four other societies. Its separate gatherings will be given up to the following discussions: economic investigation as a basis for tariff legislation (to be opened by Prof. Henry C. Emery, chairman of the Tariff Commission); a proposal for an international commission on the cost of living (led by Prof. Irving Fisher); industrial efficiency and the interests of labor (Prof. H. S. Persons of Dartmouth). At a joint meeting with the sociologists, President H. W. Farnam will speak on the economic utilization of history, and Prof. Franklin H. Giddings, of the sociological society, on the quality of civilization. A second joint session will be given up to the subject of immigration.

The economists and statisticians, on the other hand, with E. Dana Durand, director of census, in the chair, will discuss rural conditions in the South, and the decline of the rural population of the United States. Finally, the economists, with the help of the American Association for Labor Legislation, will take up questions of safety and health in mining, with papers on the Federal Bureau of Mines by the director, Dr. Joseph A. Holmes, and on a federal mining commission by John Randolph Haynes. So much for the economists, who by the end of the week ought to feel that they have rounded out the year's work and jammed down the lid ready for January 1.

Sociology also has its dynamic aspects and its indefatigable program-makers. Four independent sessions of the American Sociological Society will be held. The first morning's session will deal with the city as a socializing agency, with papers by Frederick C. Howe on the city plan, by Howard B. Woolston on the urban habit of mind, and by Paul U. Kellogg on the city and industrial cleavage. In the evening Jane Addams and C. W. Hetherington, of the Joseph Fels Endowment in Play and Educational Athletics, will

discuss recreation as a public function. A round table meeting will discuss the "function of the newspaper in the evolution of intellectual solidarity"—which may be merely the way the social psychologists have of asking how the baseball reporters came to coin "bone head." At a final meeting Jerome Dowd of Oklahoma University will report for the committee on the teaching of sociology. J. L. Gillin, of Iowa State University, will speak on the social survey in small communities, and A. F. Woods, dean of the Department of Agriculture, University of Minnesota, on agricultural education in its relation to rural sociology.

The American Association for Labor Legislation are the opportunists of these scientific groups and their Washington sessions will have a close bearing on the work of Congress and the state legislatures in the opening year. They take up at the first meeting the relation of state to federal workmen's compensation and insurance legislation. Prof. Henry R. Seager, president of the association, will deliver the introductory address; John H. Wallace will open the discussion on state accident insurance, I. M. Ru-

binow on accident compensation for federal employes, and Ernst Freund on the constitutional status of workmen's compensation. The meeting on the following morning, which will be held in conjunction with the statisticians, under the chairmanship of Charles P. Neill, commissioner of the Federal Bureau of Labor, will be devoted to the subject of uniform reporting of accidents. An afternoon session, under the presidency of Secretary Nagel of the Federal Department of Commerce and Labor, will deal with the unemployment problem in America. At this meeting William Hard will speak on unemployment as a coming issue, William Leiserson, director of the Wisconsin State Free Employment Bureaus, on the work of those bureaus, and Charles R. Henderson on recent advances in the struggle against unemployment.

HISTORY AND POLITICAL SCIENCE AT BUFFALO

At Buffalo Judge Simeon E. Baldwin, governor of Connecticut and president of the Political Science Association, will speak on the progressive unfolding of the powers of the United States, and at the same meeting William M. Sloane, president of the Historical Association, on the substance and vision of history. Another joint meeting of timely interest will deal with Spanish America. Before the Political Science Association, E. S. Corwin of Cornell University will open a discussion on the relation of the courts to legislation, J. Q. Dealey on the trend of recent constitutional changes, K. C. Babcock on the proposed constitution of Arizona, and J. P. Dunn on that of Indiana. The relation of city and country governments is another topic, and the reorganization of state governments will be discussed by Herbert Croly, whose book, the Promise of American Life, provoked much discussion a year or more ago.

At Washington, on December 27, the American Economic Association will give a luncheon to President Taft, at which the president will speak on the Federal Budget.

FOR THE CHILDREN OF BROTHERLY LOVE

Electric lights on the City Hall blazoned forth the municipal backing of the Philadelphia Child Welfare Planning Conference and Exhibit, November 20 to December 2. The exhibit was housed in a corridor on the second floor, occupying very limited quarters as compared to those which have been held in New York, Chicago, and Kansas City. The one agency which deals with more of Philadelphia's 460,000 children than any other, the public school system, was not represented, nor were a number of important private agencies, such as the Society for the Prevention of Cruelty to Children, and the Society for Organizing Charity; while others, as for instance the Children's Aid Society, were somewhat formally represented by a few photographs and a number of apparently stock leaflets and small posters under glass. Aside from the displays of the Overbrook School for the Blind and the Public Library system and perhaps one or two others, the exhibition lacked the many graphic and realistic features that so abounded in the New York Child Welfare and Budget Exhibits. Some of these confessed limitations were at least partly due to the refusal of the municipal councils to appropriate the \$1,500 requested for the purpose by the mayor. Crudely lettered placards and other evidences of haste were perhaps due to the effort to have the exhibit mark the close of Mayor Reyburn's term of office on December 3; but one result of holding it at such a time was that the attention of the city was largely centered upon the political reversal which had just taken place. The speakers at the final meeting had to compete with the bands of the enthusiastic Keystone party marchers just outside.

The conference itself consisted of a series of afternoon and evening meetings. One of the best attended of the meetings, at which many were obliged to stand, was that on sex hygiene, though in some sense the feature event was the public dinner held at the Bellevue-Stratford, at which Governor Tener and May-

or-elect Blankenburg promised their personal help to further child welfare plans. The final meeting, at which less than fifty people were present, was devoted to reports from the various committees. After introductory addresses by Ex-mayor Reyburn and John C. Delaney, chief of the state bureau of factory inspection, John Thompson, city librarian, made suggestions for better co-operation between the schools and the libraries; Mrs. George K. Johnson urged that the city buy a farm training school; S. J. Russell spoke of the need of more accurate and complete institutional records; William S. Bennett declared that one or two judges instead of several should preside over juvenile cases and that they should be tried at the house of detention without preliminary hearings before magistrates in the city hall; and Dr. Walter S. Cornell of the Bureau of Health expressed the hope that the city would acquire the Lazaretto property at Essington to aid in housing feebleminded children.

—Boardman Robinson in the N. Y. Tribune.
CARNEGIE—HOOTS! JOHN, I BEAT YE TO IT!

The conference was brought to a close with an address by Mrs. Frederick Schoff, president of the National Congress of Mothers, who was credited by Mr. Reyburn with being the originator of the undertaking.

BLANKENBURG: HIS CABINET

The appointments which Mayor Blankenburg has made to his "cabinet" positions are the subject of congratulation among the social workers of Philadelphia, and to their minds presage an era of constructive co-operation in public affairs. In the first place, in response to widespread demand, Mayor Blankenburg has retained in office the director of public health and charities, Dr. Joseph S. Neff, whose department has been regarded as the most efficient of those directly responsible to the city administration. To the directorship of public safety, the ranking position in the cabinet, Mayor Blankenburg has appointed George D. Porter, who for fifteen years has been known for his practical idealism and active work in reform politics. For one term he was a reform member of councils. A banker in business hours, in his leisure time he is, for one thing, Boy Scout commissioner for Philadelphia. George W. Norris, who becomes director of wharves, docks, and ferries, is a member of the board of directors of the Philadelphia Society for Organizing Charity, is vice-president of the City Club, and is chairman of the housing commission. He recently resigned from partnership in one of the most influential banking firms in the community, in order to give his time entirely to the study of municipal problems and problems of transportation, in both of which subjects he was already recognized as an expert. Morris Llewelyn Cooke, who becomes director of Public Works, is one of the "Taylor group" of efficiency engineers, and was recommended for the position by Mr. Taylor himself. He is the author of the report on the efficiency of the teaching of physics in our universities, prepared for the Carnegie Foundation for the Advancement of Learning. Herman Loeb, who becomes director of

supplies, has been long identified with reform activities.

Cyrus D. Foss, Jr., is secretary to the new mayor, an active member of the National Civil Service Reform League, and one of the civil service commissioners of Philadelphia during a preceding administration. He was one of the founders of the City Club, of which all of the appointees, with one exception, have been active members.

SOCIAL SERVICE AND THE INSANE

The Manhattan and Central Islip state hospitals, the two largest institutions for the insane in this country, have taken the lead in this field in establishing hospital social service work. The New York State Commission in Lunacy has authorized the appointment of an agent to assist patients discharged as recovered from these state hospitals, and to do such work in connection with the patients and their homes as may assist the physicians in dealing effectively with the patients, and in establishing their cure. Such work has been carried on for nearly six years by the State Charities Aid Association, the first to undertake the after-care of the insane in this country. The association's Committee on After-Care, appointed in February, 1906, subsequently named Committee on Mental Hygiene, has employed an agent who has devoted most of her time to becoming acquainted with the needs of the recovered insane, and furnishing suitable employment, opportunity for rest, if needed, and friendly aid and counsel for those requiring such assistance. It is this agent, E. H. Horton, who has now been appointed after-care agent for the two state hospitals receiving patients from the city of New York. These hospitals, which together have a population of about nine thousand patients, annually discharge as recovered about six hundred patients. Most of these patients go to homes where they can receive proper care, and be prevented, if possible, from suffering a recurrence of their mental disease. There is a considerable proportion, however, who need assistance in

readjusting themselves to life in the world, and careful supervision during the difficult months when they are re-establishing their relations with their homes and friends and fellow-workers.

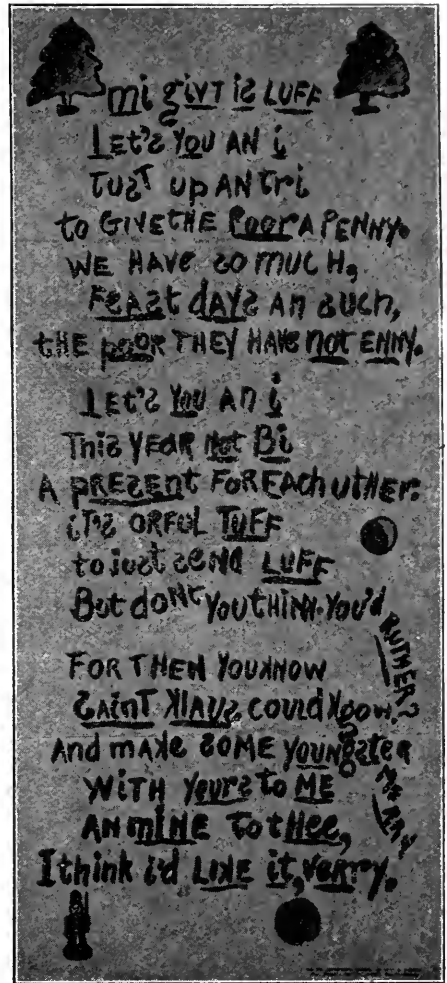

The experimental work carried on for the past five years by a private society has thus reached a stage of demonstrated usefulness where the state authorities are willing to undertake the responsibility for its continuance. The beginning made in connection with the Manhattan and Central Islip state hospitals is of course, a small and inadequate one, for no one agent can possibly do all that needs to be done for the very large number of patients treated and cured by these enormous institutions. But it is a beginning, nevertheless, and those who are concerned with the progress of American work for the insane regard it as probable that within the very near future each of these hospitals will have a corps of workers, and that it is a presage of the development throughout the country of systems of hospital social service in connection with institutions for its insane.

EDITORIAL GRIST

CHRIST'S BIRTHDAY CLUB

GRAHAM ROMEYN TAYLOR

The spirit which has so widely enlisted shoppers, newspapers, and stores in the holiday season "shop early" campaign is carried perhaps still more searchingly into our celebration of Christmas by a comparatively new organization—"Christ's Birthday Club"—which originated in Chicago, some two years ago. The club is a group of people held loosely together by the common belief, rapidly spreading, that Christmas has become a burden to many. Members pledge themselves only to a consideration of the nature of the Christmas celebration. It is the aim of the club to stimulate the formation of small local groups who shall work out in their own way a more rational, simpler, and genuine observance of the Christmas spirit. It calls attention not only to the rush of Christmas shopping, with its intolerable strain upon the workers, but also to the

POSTER OF CHRIST'S BIRTHDAY CLUB.

Copies, while they last, may be obtained from the club, 4823 Lake Avenue, Chicago.

lavish expenditure of time and money on useless and impersonal "gifts." In their stead, it urges few and simple gifts for close friends, the thoughtful personal remembrance of the many through giving pleasure that satisfies without implying obligation, the wise expenditure of money where there is real need, and above all a celebration of the day as a joyous home festival.

Much of the stress and strain of present-day Christmas is sheer thoughtlessness; some of it is custom. But if they give it thoughtful attention, there are few who would not appreciate more fellowship and good will shown in the

cordial greeting, the letter or note, the visit or invitation, instead of the blind stampede to get something of a certain value for everyone on one's list. For too many people the holidays mean, first of all, a desperate struggle up to Christmas eve to make things to give away, and then a great feeling of relief that it is over for another year, the joy of giving quite overshadowed by the toil and obligation. And how many white elephants cumber the mails!

In these days of festival revival, that feature of the celebration scarcely needs emphasis. With its world-wide appeal, its wealth of legend and dramatic potentialities, and its happy significance, the Christmas season, of all others, needs only a little imagination and ingenuity and a general participation to make it a real festival.

In its efforts for a Christmas of greater good will, good cheer, and personal thoughtfulness all along the line, we can all cordially wish the Christ's Birthday Club Godspeed.

NATIONAL IMMIGRATION CONFERENCE

JOHN DANIELS

North American League for Immigrants

Substantial promise of cooperation between the federal government, the states, and semi-public agencies, in the systematic distribution and assimilation of immigrants, is afforded by the first meeting, held at Washington, of a body now permanently organized as the National Conference of Immigration, Land, and Labor Officials, with membership limited to such officials.

The meeting was called by the Division of Information of the Department of Commerce and Labor. Secretary Nagle made an opening address expressing his special sympathy with the purposes in view, and emphasizing the need of protection during the journey to the destination. T. V. Powderly, chief of the division, presided at the sessions. Thirty-seven delegates, representing immigration, agricultural, and labor bu-

reaus of twenty-seven states, attended.¹

There was no prearranged program. That every delegate was loaded to the nozzle with statements of the needs of his state and with concrete suggestions for meeting these needs was evident at the outset.

Discussion of the need for more farm laborers and farmers developed into the question of the general industrial distribution of immigrants from congested centers into not only agricultural but other channels. And, finally, clear enunciation was given to the necessity of combining with a plan of distribution a program of assimilation, as the only means of overcoming and preventing the growth of foreign colonies and un-American and undesirable conditions.

The second day the conference went into executive session, formed a permanent organization² representative of North, East, South, Center, and West, outlined objects, and laid plans.

The committee on resolutions, of which Miss Keller was chairman³ submitted resolutions which were adopted as practically a preliminary constitution.

The general purpose of the organization was stated as follows:

I: To arouse public sentiment:

1. favoring increased congressional appropriation, enabling the Federal Division of Information of the Bureau of Immigration of the Department of Commerce and Labor to induce admitted foreign-born and native people to leave congested population centers and go to agricultural and other industries;

¹The states represented were: New York, Massachusetts, Oregon, Montana, New Jersey, North Dakota, Maryland, Arkansas, Washington, Nebraska, California, Texas, Tennessee, West Virginia, Illinois, Wyoming, Wisconsin, Iowa, Utah, Colorado, Ohio, Louisiana, Delaware, Minnesota, Kansas, District of Columbia, and Hawaii.

²The officers elected were: Honorary president, T. V. Powderly, chief of the Division of Information, U. S. Bureau of Labor; president, Prof. John R. Commons, of the Industrial Commission of Wisconsin; vice-president, A. P. Sandles, secretary of the Board of Agriculture, Ohio; treasurer, Charles F. Gettemy, director Bureau of Statistics of Labor, Massachusetts; secretary, Frances A. Keller, chief of the Bureau of Industries and Immigration, New York. The executive committee consists of these officers and the following four additional members: J. F. Denechaud, secretary Board of Agriculture and Immigration, Louisiana; F. B. Haynes, special commissioner, Nebraska; R. N. Lynch, vice-president Development Board of California; R. A. Pearson, commissioner of agriculture, New York.

³The other members were A. E. Nelson of Minnesota, J. B. Haynes of Nebraska, Austin Cunningham of Texas, and John D. Tenor of Hawaii.

2. favoring the creation of state bureaus of immigration and information, with representatives at ports of entry, and appropriations therefor by the several states;
3. favoring the extension of the activities of such bureaus for the protection, education, and assimilation of immigrants;
4. favoring the fullest co-operation between the several state bureaus and between the state bureaus and the federal division of information in the above objects.

II: To enlist the aid and co-operation of commercial, civic, philanthropic, and other organizations in the above objects.

By way of immediate action toward the carrying out of this purpose, it was voted to

recommend the establishment of state employment bureaus in the various states, and the enactment of laws safeguarding laborers in search of employment and the establishment of immigration bureaus in states now without them;

and to instruct the executive committee

to prepare, in co-operation with the chief of the division of information, amendments enlarging the powers of said division to deal with interstate problems affecting the distribution, protection, and welfare of admitted aliens, and enabling the said division to establish branches at such centers of redistribution as may be desirable.

The division of information, it might be said, is a federal labor bureau. Its New York city branch office, the only active one which its meager appropriation has permitted, last year distributed 4,283 laborers to thirty-five states. The action of the conference contemplates, first, the extension of the number of branches of the division and, second, the extension of the division's functions to include measures for the general welfare of immigrants.

The distribution of native immigrants, between states, as well as of admitted

aliens, is included in the scope of the conference, and all questions having to do with admission or exclusion of immigrants are outside its scope and are not to be dealt with in any way.

The possibilities of achievement through this organization are tremendous, not only in close, concrete, and determined cooperation between the federal government and the states, but in the same sort of cooperation between federal and state agencies and such commercial, civic, and philanthropic bodies as are working along parallel lines. The Distribution Committee of the North American Civic League for Immigrants, in particular, has for some time been promoting concerted action designed to facilitate the distribution of immigrants from New York city, and to obtain at New York city a central bureau of information for the whole country. It is to be hoped that a plan of effective co-ordination between that committee and the conference will be worked out and such a bureau realized.

The chief immediate problem before the officers of the conference is to obtain the necessary funds to open, equip, and make effective one or more offices. The hope is that at an early date offices can be opened at New York, Pittsburgh, and Chicago, at least. As no state or federal appropriation for the purpose is available at this time, though, as the

work becomes known, such governmental support will undoubtedly be given, the funds needed must be obtained from philanthropic sources until the states have something to show for their demand for appropriations. It is another opportunity for philanthropy to show the government the way and to get it to take up its responsibility toward the distribution and assimilation of immigrants.

RELIGION IN SOCIAL ACTION

II

THE HUMAN POINT OF VIEW

GRAHAM TAYLOR

Old John Bunyan describes each individual life as "the citadel of man-soul." He thus speaks as though each human being is a field for the conquest of religion and a force with which it is to win its way in all the world. From the human point of view, the religious spirit may best be seen on its way into the citadel to save, and on its way out to serve. Two simple stories drawn from close human experience will point both ways.

OUT OF THE DEPTHS

A baby lay dead. Over its little form hovered the grief-calmed mother and the sorrow-distracted father.

"I told him," she said, "that he is too good a man for his job."

"What is it?" was asked.

"Well, I am a gambler," the man replied. "But I hate the thing, the place, and those who frequent it, and I wish I need never go near it again."

"If you do," he was warned, "you go from the light you now love into the darkness you dread, with your eyes wide open."

"I'll see," he said, and lapsed into silence.

Then followed the baby's funeral. A few days after the father stood pitifully alone on the threshold of his new life. So lonesome was he that he carried in person a letter which he had addressed and stamped to mail. For he thought that if he came with it, it might open to his empty heart something of human fellowship for which he hungered. And it did, as such a letter could hardly fail to reach the heart of anybody who had one:

SIR AND FRIEND:

I have determined not to go back into the old business, come what will. But you must know that I have great anxiety for the future. I trust that there will be an opening so that my wife and child will not starve. I do not know that I am under any special conviction of sin, but I do long to associate with good and Christian men and women. I

am starved for that association. If I could have it, I believe I could soon be willing to leave all to God. You can hardly imagine the darkness, almost despair, that at times I have been in. But for years I had no one to talk with, as I now do with you, and I have had to bear all, alone, without human help. Words cannot tell you how I long to be out from all low and wrong associations. They none of them have any pleasure for me and I do not believe that I shall be compelled to have any more of them.

With loving respect,

STARVING FOR BETTER ASSOCIATIONS

Here, then, was a man "starving" for association with good men and women. Back there under the shadow lay his evil associations and his bad associates. Out here he had come into the trailing light left streaming into his tear-dimmed eyes by the disappearing life of the little baby whom he had passionately loved. If he was to stay out and follow on he must find new associations, other places to be in, better things to do, "good and Christian men and women" to associate with. Religion meant to him changed relationships. And the change of associations was the condition, if not the equivalent, of his conversion. To find the good God, he was seeking better men and women. Not only to him, but to those of us who knew him, the one hope he had of the divine companionship was in finding men and women who were companionable with his new-found life. The very existence of his new ideals depended upon his finding human conditions and relationships which were at least compatible with them.

But scarcely had this former gambler found his own place among the kinship of his new spirit than "the way of life" led him through the valley of the shadow of death. Stricken by an occupational disease in the only employment which opened to him, his manhood stood the supreme test of sacrificing all for the highest and the best. When asked whether he would rather be as he had been, in

the more prosperous ways he had forsaken, than stand at the end of his new life's hard struggle, he exclaimed, "Let me be, I would have lost my crown."

APPROACH TO THE CITADEL OF MAN-SOUL

In this instance, at least, the new emphasis upon the social conditions and relationships of life was born out of the old "burden for souls." It is shortsighted to ask whether you should work for the individual or for his surroundings and relationships. You cannot work for one without working for the other. You are not shut up to such a dilemma. You ought to work both ends of the line at once if you expect to meet the real man in the middle. For the approach to the innermost self lies through some one or more of the concentric areas in which each one of us lives, moves, and has his being. "Eye-gate, ear-gate, touch-gate" are the avenues of sense which lead to the spirit. And just behind these senses lies the thinking mind, the whole area of the heart's emotions, the moral judgments and sanctions of conscience; still deeper, the religious feelings; and, towering above all, the imperious will, that citadel to which, as to imperial Rome itself, all roads lead. All around and about the body, mind, and spirit of every one of us also lie the human relationships, the social surroundings, the civic frame-work, the hereditary and historical antecedents which go far toward making us what we are. Through all these areas everything that influences us must pass, before it reaches our outer gate and enters in to the citadel of our selfhood.

So identified are we with our surroundings, which yet we strangely transcend, that the modern man is less and less able to consider himself apart from them, or to consider religion real if it does not embrace them. No man wants anyone to tell him he loves his "soul" if he does not love him. If you love my soul and do not love me, it means nothing. I do not and cannot take it to be love, if you do not care about my life, or whether my wife can stay at home to take care of the babies instead of going out to work to help me eke out the living which I have no

fair chance to earn for my family; or whether my children can have enough schooling to get a good start in life; or whether I have a hovel or a decent house to live in; or whether the city is given over to corruption, so that I cannot bring my children up safely. What do I care, if you care for my soul, and do not care for me and mine? For what is my soul? Is it anything less than myself? Is it not all I am or can become?

ANOTHER HUMAN INTEREST STORY

And this is the way that same spirit, after it has become the conquest of religion, goes forth to serve its fellows. Listen to this other man's quest for the Holy Grail:

DEAR PASTOR:

In the first place, when we try to help a fallen brother, the odds against us are too great. Last night I believe that man was in earnest. When he said, "I am tired of sin," he meant it. He wanted freedom, peace, happiness. What were the odds against him and those new-born impulses? He went out from God's house, away from those commissioned to do his work. Where could he go but out into the cold, friendless streets of a great city? Then what? He had no home to go to, no friends to cheer and wish him God-speed, so he must walk the streets. Were there no warm lighted rooms to welcome him? Yes, but he was to shun the dram shop. He did this. He passed by seven, with the struggle which God only knows. The door of the eighth stood open. It did look warm and comfortable within. So he finally went in, and going apart from the motley crowd of hangers-on he removed his hat, and took from it the little card containing the time and place for meeting the new-found friends the next day. Alas, there and thus I left him. Perhaps I ought to have done something with him or for him. But what could I do? Where could I have taken him? Cannot something be done to lessen these odds, to even things up, to give the Lord a fair show with a man who wants to be saved?

Thus on the field, in personal work, the individual emphasis and the social emphasis are seen to be two sides of the same thing. When men rise up in response to the religious appeal and say, "If you knew how I live and have to live, and where I work and have to work, and how I earn my livelihood, you would not be quite so sure that I could accept this doctrine of the pure heart quite so readily," they may not be

believed, but at least we can look to see whether the living and working conditions are such that the way of making a livelihood is the "way of life," or the way to death; whether the ways in which young people seek their pleasure lead them up or down; whether our municipal conditions and city government make it easier to do right and harder to do wrong, or easier to do wrong and harder to do right.

TWO SIDES OF THE SAME SHIELD

You cannot have a saved life survive always in unsaved surroundings. You cannot have a saved soul in a lost body. You cannot be half saved, inside and not outside. You must save a larger and larger part of the world's and man's human relationships, and make his surroundings at least compatible with the ideals of life which you are holding out to him, if he is ever to realize those ideals. The undoing of "evangelized" souls by unevangelized surroundings and relationships is the tragedy of modern religious experience. It is often due, not to the lack of the desire to be religious, but to the lack of that atmospheric pressure to protect and promote right living which every community ought and can assure everyone who enters upon the religious life. Law has been finely defined as the "steady pressure of divine love." Every one of us needs that pressure and the steadiness of it. Remove it from those of us who have never known what it is to be without it, and who of us knows what would

happen to him? A foot-soldier in the Civil War said that the carnage of the battle, the crushing of the bones of the wounded under the cannon wheels, the agony of the dying were not so appalling as the collapse of character, when men were taken away from the atmospheric pressure of the restraints and impulses, to which they had been accustomed at home.

In his *Consular Sketches*, Hawthorne describes the appearance of an American clergyman who came to the consulate to request him to keep his mail until called for. After the captain of the vessel on which he was to return home had been compelled to sail without this passenger of his, the man returned to the consulate so changed in appearance that he was scarcely recognizable. He re-introduced himself and asked for his mail. Then Hawthorne, taking the part of a faithful friend, told the man he need not explain; that he had not known how weak a man he was until he had found himself alone, away from home, and lost in the crowd of a great strange city; and that he should never again trust himself away from the restraints and supports of his home surroundings, to which he was advised to betake himself without delay.

From the human point of view, the social emphasis, therefore, is just as personal as religion is, and that is about the most personal thing there is. And, on the other hand, the individual emphasis is just as social as is the life of a mortal man.

CIVICS

THE BOARD OF PUBLIC WELFARE OF KANSAS CITY

FRED R. JOHNSON

Superintendent Research Committee

Mr. Johnson's article on the Board of Public Welfare is in no sense a critical appraisal or analysis of the work performed by this branch of the municipal government of Kansas City. It sets forth the scope of its activities and the principles by which it aims to be guided. Henry Bruere, a director of the Bureau of Municipal Research, New York city, has said of a bulletin issued by the department in connection with the recent Kansas City Child Welfare Exhibit that it "is one of the most interesting expressions of a social program that I have seen announced by any municipal agency. It is not because what the document says is so significant, but that it should be said and thought by a duly constituted public body working not under the auspices of a private board but for a city government. With the possible exception of some work now being done in Milwaukee and the program of the fusion Board of Estimate and Apportionment in New York city, the program of your board of public welfare, in my judgment, is the most progressive program in America."

The Board of Public Welfare is a part of the regular city government of Kansas City, and consequently is supported by public funds. Composed of five men appointed by the mayor, it is absolutely non-partisan. The members are not balanced between the two leading parties, as supposedly non-partisan boards frequently are, but are appointed without any reference to party affiliation.

The board has supervision of the general charitable and correctional problems of the city, and to this extent corresponds to the customary boards of charities and correction; but its powers are much broader in scope. A committee appointed early in 1910 by the mayor of Kansas City was charged with the duty of "working out and recommending for adoption a plan calculated to cover in a comprehensive manner the city's obligation towards the unemployed, the poor, the sick, and delinquent." It was as a result of their recommendation that the Board of Pardons and Paroles, founded in 1909, became the present Board of Public Welfare, with powers to carry out the ambitious policy mapped out.

Certain principles were laid down at the very beginning which have served as a guide. Among these may be mentioned the following:

1. The board lays emphasis on justice rather than charity and on prevention rather than cure.

2. It believes that social action should be based on accurate knowledge and that investigation should both precede and accompany all efforts to improve social conditions.

3. It strives for harmonious co-operation with all existing agencies, both public and private, and does not duplicate the work of any.

4. The board gives no public outdoor relief except in cases where the bread-winner of the family is a city prisoner, and then only on the basis of actual destitution.

Trained social workers are relied upon by the board to carry out the details of these policies. They have been largely recruited from those who have had previous experience in private charitable enterprises and who have also had specialized college training in social work.

There are at present ten divisions of work, as follows:

1. District Superintendence.
2. Social Service Department.
3. Department for the Homeless and Unemployed.
4. Welfare Loan Agency.
5. Municipal Farm.
6. Women's Reformatory.
7. Parole Department.
8. Recreation Department.
9. Legal Aid Bureau.
10. Research Bureau.

The Social Service Department is conducted in close co-operation with the Provident Association, the local representative of organized charity, and the Department for the Homeless and Unemployed in co-operation with the Helping Hand Institute, a private organization which has been unusually effective in caring for homeless men and women. A municipal employment bureau and a municipal quarry, both operated by this department, assist in providing work for the unemployed. The Welfare Loan Agency is conducted by the Board of Public Welfare, but its funds are furnished from private sources. During the first five months of its existence this agency made 482 loans, aggregating \$24,817.47. The number of loans at present exceeds 100 each month.

Originally, as the Board of Pardons and Paroles, devoted to the treatment of misdemeanants, it is along this line of work that the most progress has been made. Three departments co-operate in the treatment of the delinquent: the Municipal Farm, the Women's Reformatory, and the Parole Department. All male city prisoners have been removed to the municipal farm located outside of the limits of Kansas City. The average number of prisoners confined here exceeds 200. All the able-bodied are supplied with work. Some are engaged in construction work, others in tilling the fields, while still others build roads and perform necessary duties about the farm. While confined at the workhouse within the city, it was not possible to provide sufficient work for all the men. The new departure has supplied healthy work for all. The men are not shackled, and physical restraint is reduced to a minimum. There is ample evidence that the new environment has not only been of benefit to the men physically, but that it has assisted in their moral reformation.

Kansas City has repudiated the theory that the community should punish the wives and innocent children of men who have committed some offence by withdrawing their only means of support. Where investigation discloses that families are in want because of the imprisonment of the chief breadwinner, the Board of Public Welfare pays a certain amount towards their support. What the misdemeanant earns is thus applied towards the support of his family.

When the last male prisoners were withdrawn from the workhouse in June, 1911, this building was converted into a women's reformatory. Those detained are not only provided with work and medical attendance, but are also given industrial training and the privilege of attending night school. Every assistance is afforded towards reforming the delinquent women and making them independent and self-supporting upon their release.

The Parole Department works hand in hand with the Municipal Farm and with the Women's Reformatory. Present laws in Missouri do not admit of the indeterminate sentence. The only system of punishment for city offences in Kansas City is by means of fines, with imprisonment as an alternative if the fines are not paid. Paroling prisoners in part makes up for this deficiency. During the last fiscal year, 1660 paroles correspond-

ing to about one-half of all commitments, were granted. Only 10 per cent have been returned for violation of their parole. The average weekly earnings of men reporting on parole during 1910-11 were \$10.46.

The parole officers keep detailed records of all convictions and all the evidence brought out in the police court. They have a bureau for registration of crime in Kansas City to assist them. All information as to the conduct of the men while on parole is entered on these records and in cases of recidivism it is not difficult to deal justly with the men.

The police courts refer a large number of non-support cases directly to the Parole Department. Some cases of this kind are handled without even the formality of an arrest. Men paroled when charged with non-support must promise to turn over their earnings to the parole department for the benefit of their families. In this way \$8,346.21 was collected and applied during the past fiscal year, and the next year will show a very considerable increase.

The Recreation Department of the board maintains supervision over all public dances in the city. Licenses must be secured for all such dances, and an inspector is present to see that dance hall rules are complied with. These rules bar the sale of liquor, provide that dance halls be properly lighted, forbid "shadow" and "moonlight" dancing, stipulate that all dances must close at twelve o'clock unless a special permit is secured, and provide that no girls under seventeen shall attend public dances unless attended by parent or guardian. Failure to comply with these rules results in a revocation of the dance permit. During the first year of inspection, more than 300 young girls were sent from dance halls and their parents notified. That inspection has resulted in raising the standard of the dances is attested by the owners of dance halls themselves. It has also increased instead of diminished the attendance at these dances.

The Legal Aid Bureau is a new departure in the field of social work. Legal assistance is furnished free by the city itself to those without funds. Cases are taken into the courts when it is found necessary. Wage claims constitute the largest class of cases handled. These are all for small amounts, which as a rule would not be collected were it not for this bureau. During the first eight

SUPERVISING DANCING AT A TYPICAL DANCE HALL.

months of its existence, 1095 wage claims were handled and \$6,046.40 was collected. The number of new cases at present averages fifteen every day. Desertion cases form an interesting class. Where fathers desert families with small children, they have been brought back by this bureau at the expense of the Board of Public Welfare from points as far remote as Wheeling, W. Va., and Sheridan, Wyo.

The Research Bureau is engaged in a social survey of the city. Investigations of unemployment, the social evil, and the charitable situation in the city have been made and the results published. Investigations of housing and the wages and working conditions of men and women in factories and mercantile establishments are under way. The results of these have not yet been published, but were displayed, in so far as the work had progressed, in, the Kansas City Child Welfare Exhibit.

Classified under the work of this bureau for purposes of convenience are found the Registration Bureau and Endorsement of Charities. These two services make possible a unified system of charity work and promote co-operation. Both, without exception under private control in other cities, are public agencies in Kansas City. Registration of cases is not limited to relief agencies but

includes social settlements, day nurseries, medical agencies, and all the various forms of social welfare activities.

Forty-one institutions were endorsed and thirteen refused endorsement during the past fiscal year. A "white list" was published and mailed to all members of the Commercial Club and to others interested. Supplementing this, a detailed directory or handbook has been prepared to provide the basis for intelligent giving. Several organizations, nationwide in scope, which as a rule have been temporized with by endorsement bodies elsewhere, have been refused endorsement in Kansas City. No attempt has been made to curtail the activities of those not endorsed, beyond giving information concerning them to all inquirers. The effect of non-endorsement has, however, been very marked.

The question naturally arises as to how the above activities, so many of which are nominally conducted by private organizations, can be undertaken publicly without being crippled. A full answer involves familiarity with the local situation. Among contributing causes, however, may be mentioned the ever growing political independence of the West. Kansas City is thoroughly progressive. Its city departments, including the Board of Public Welfare, were recently placed on an effective civil service basis. The board it-

self, as already noted, is absolutely divorced from politics. The two men recently chosen to replace the retiring members of the board were nominated by representatives of the private philanthropies of the city and were immediately appointed by Mayor Brown. There is a firm belief in Kansas City that the public conscience is aroused to such an extent that a public board devoted to the cause of securing justice and fair treatment for those who are in misery or who are pressed down by adverse conditions will never be made the football of partisan politics.

HOUSING REFORM IN HUNGARY

The need for providing sanitary and comfortable dwellings for the agricultural laborers who contribute so largely to the prosperity of the country has been realized in Hungary. Private enterprise did not meet the widespread want. Experience also showed that the parish authorities were unwilling or unable to make adequate provision.

Dr. Daranyi, the minister for agriculture, decided that the welfare of the nation demanded that the state should bring its resources to bear upon the question. He included in his budget provision for aiding the work of supplying suitable and hygienic dwellings for agricultural laborers. The annual expenditure for this purpose from 1901 to 1905 was \$12,090.

In some cases the laborer received newly built cottages ready for occupation; often, however, the authorities supplied him with a plot of land and building materials at preferential rates, prepared plans, and superintended the work of building. The laborer himself made the bricks. The cost of each dwelling varied from \$165 to \$185, which the prospective owner undertook to repay in annual instalments extending over a period of from ten to twenty years.

The demand for cottages became much greater than could be met with the sum granted by the state. In 1906 the annual grant was increased to \$63,000, but even this proved to be altogether inadequate. Accordingly Dr. Daranyi, in 1907, introduced a bill in which he asked the Hungarian Legislature to sanction the conversion of the sum of

\$63,000 already ear-marked in the budget for aiding the erection of agricultural workers' dwellings from *capital* into *interest*. By using the grant as capital only about six hundred cottages annually could be built, but by treating it as interest about fifteen hundred could be erected. The bill was passed in August, 1907, and at once became operative.

Its main provisions are as follows:

If any local authority sells real estate to agricultural laborers for building purposes, the minister for agriculture may make at state cost all the necessary surveys, plans, and contracts. The interests of the workers are safeguarded in several ways. The estate selected for cutting up must be suitable as regards soil, air, and drinking water. The operations must serve the public interest, and have no speculative tendency. The conditions of the sale or loan, the terms of loan, and the general plan must be favorable from the point of view of the agricultural laborer. During the period covered by the repayment of the loan, the property cannot be taken in execution for ordinary debts, nor can it be divided, encumbered, alienated. Complete exemption from taxation is granted for twenty years, during which period *no alcoholic beverages are allowed to be sold on the property*.

The minister of agriculture gives preference to the applications from such parishes and local authorities as make a free grant of land on which to build the house, or of ground suitable for gardens. The materials required for the purposes of the act are forwarded at cost price on all the railways owned or worked by the state. State aid is granted only for buildings designed to accommodate one family. Each cottage is erected on a plot of 1,000 to 1,200 square yards, at a cost of from \$155 to \$310. This is redeemed by annual payments of from \$12 to \$20, extending over twenty to thirty years. Thus a laborer can become the possessor of a freehold, brick-built, healthy, and well ventilated cottage in a garden at an outlay of not more than the rent of one room. In one year, under the provisions of this act, 10,943 cottages were built for agricultural laborers in various parts of Hungary.

THOROUGHFARE TUNNEL AT BUDAPEST.

PLAYGROUND OF NATIONAL TUBE COMPANY, LORAIN, O.

CIVIC IMPROVEMENT

CHARLES MULFORD ROBINSON, Contributing Editor

A STEEL COMPANY'S PLAYGROUND

The accompanying playground photographs are of special interest, for they illustrate the workings of the heart of a steel company—an organ which in some cases has appeared to be all but atrophied. The playground is situated in Lorain, O., and both the equipment and maintenance are paid for by the National Tube Company. The ground is located in a section inhabited by recently arrived immigrants. The average daily attendance during the summer was 210; and the fathers of 200 of the children, it was found, were employed in the steel works. The city, through the interest of a playground association which is an offshoot of the Board of Commerce, helped to secure the lots, and provided wire-fence, shelter, and drinking fountain. The National Tube Company furnished the apparatus, paid for supervision throughout the summer, and then retained a kindergartner for the autumn. A similar playground was put by the company at the disposal of the Pittsburgh Playground Association for the use of the neighborhood about one of its Pittsburgh plants. Even larger work is planned for next year.

CITY PLANNING

The secretary of the National Conference on City Planning—Flavel Shurtleff, 19 Congress street, Boston—has issued in a dignified volume the Proceedings of the meetings held

in Philadelphia last May. The papers discuss a wide range of topics, generally with considerable authoritativeness, so that the book in a measure makes up in breadth for what, as a collection of convention papers, it lacks in correlation and exhaustiveness. It gives plain evidence that city planning is very earnestly and very practically considered by a great many people, and that it consists of much more fundamental things than simply clever drawings of what may be called municipal art conceptions.

FUN FOR LITTLE TOTS.

A PAMPHLET ON PLAY

C. P. Cary, state superintendent of education in Wisconsin, has issued a valuable pamphlet on Plays and Games for Schools. Its 100 pages, in which are interspersed some photographs, diagrams, and a little music, are full of information which is made readily available by well devised indices. It may astonish some old folks to learn that about a hundred and fifty different games are described. Yet the author says that his purpose has been "to prepare a suggestive selection of games rather than a comprehensive collection." In making the selection, the needs of rural schools have been kept in mind, and the children of the elementary schools considered rather more than those in high schools. Other features of the pamphlet are references to books on the subject and a considerable collection of striking quotations, old and new, on the value of play.

AN OLD-TIME LEADER

One of the most notable civic organizations in the country passes out of existence as the result of the birth of a new and mighty Chamber of Commerce in San Francisco. This is the Merchants' Association; and as it does not die, but enters by merger into the new chamber, we may expect that its civic spirit will go marching on, attaining to larger life and greater influence. The San Francisco Merchants' Association was one of the first of the large organizations of business men to interest itself in civic matters. For sixteen years it has been at the forefront of almost every good movement in San Francisco that could be called civic in scope. Its monthly *Bulletin*, as a record of progress, has been an interesting paper. The high position thus early taken and so long held has been largely due to three men: F. W. Dohrman and Frank J. Symmes, its first two presidents, and L. M. King, its secretary.

PARKS AND SHADE TREES

The seventh annual report of the Newark Shade Tree Commission has been published in illustrated pamphlet form, and as usual it is an interesting work. If any one wants to know how to interest children in street-tree work, and the gain to the city from interesting them, he should send for a copy. But the reports of the commission have so often been used here as a text for telling of good street-tree work that it seems wise this time to select a quotation on quite another subject. The Newark Shade Tree Commission is charged also with the care of the city parks, and this comment upon them is one that may be echoed in other cities and towns throughout the land: "The city parks grow from year to year in beauty and in favor with the people. Greater numbers than in any former year used these pleasant open spaces. At ruddy morn and dewy eve,

through all the hours between, and when night had fallen on the city, these green areas were frequented by the multitude, men, women, and children—demonstrating again their utility in furthering the public health and contentment and in promoting good order and good citizenship. These parks are a most important factor in endearing Newark to its people and, as a consequence, in deepening and enlarging civic patriotism." As to the trees, to go back for a moment, one of the reasons that the Newark commission has been able to do such exceptionally interesting and satisfactory work is that it is invested by statute with "exclusive and absolute control and power to plant, set out, maintain, protect, and care for shade trees in any of the public highways" of the city.

A USEFUL ORGANIZATION

The most significant feature of the *Year Book for 1911* of the Civic League of St. Louis—a substantial pamphlet of a hundred pages—is a summary of the good things which the league has to its credit. One is struck by the number of enterprises in the list which the municipality has taken up after the league started them and proved their value; and that is one of the most useful functions which a civic league can have. For example, the league started the playgrounds; it initiated the free public baths, and maintained them until the city assumed control; it conducted vacation schools for two years when, their worth having been demonstrated, the city became responsible for their maintenance; it organized the school gardens, and kept them going until the city relieved it; and the movement which ended in making the centennial celebration an official event was begun by the league. In addition to this kind of work, the league has fathered a large body of useful legislation. This includes: certain health ordinances; the creation of an official city plan commission; the establishment of the Municipal Reference Library at the city hall; the creation of the office of city forester; the act enabling the city and county to establish an outer park system; the one establishing an improved system of garbage collection and disposal; the legislation securing the appointment of the Kingshighway Commission; the voting of several large appropriations for constructive work of one kind and another; and finally the billboard ordinances which are now before the courts. Further it has prepared and published a number of valuable expert reports, such as those on the disposal of municipal waste, the smoke nuisance, tenement house conditions, street lighting, public comfort stations, the city charter, etc. As one reads the list, one begins to wonder what St. Louis would be without the Civic League, or how any city can get along without such an organization.

HEALTH

CONFERENCE ON INFANT MORTALITY

J. W. SCHERESCHEWSKY

U. S. PUBLIC HEALTH AND MARINE HOSPITAL SERVICE

The second annual meeting of the American Association for the Study and Prevention of Infant Mortality, held in Chicago, Nov. 16-18, 1911, was marked by the quiet yet thoroughgoing enthusiasm of an organization which has found itself. The year which had elapsed since the Baltimore meeting had brought about a crystallization of ideas and a tendency was manifest to disregard non-essentials and to reduce factors to the ultimate analysis.

The section on city milk supplies distinguished itself by the adoption of a resolution predicting the course of action which, I believe, will at no distant date be taken by all municipalities which profess solicitude for the welfare of their citizens. Professor Mazyck P. Ravenel, of the University of Wisconsin, gave an able exposition of the evidence by which we are forced to conclude that at least 30 to 40 per cent of tuberculosis in city children has its origin in bovine sources of infection, and that milk is the intermediate carrier by which it is disseminated. By reason of this and Dr. W. A. Evans's paper on pasteurization, in which it was shown that the danger of causing infantile scurvy in the destruction of tubercle bacilli and other pathogenic organisms in milk by efficient pasteurization is largely imaginary, the section passed the following resolutions—not, however, without some opposition.

I. Resolved, that we recognize the danger to human beings, and especially to children, from the bovine tubercle bacillus. We therefore demand protection against this danger by the enactment and enforcement of laws requiring the tuberculin testing of all cows furnishing milk for human consumption.

II. Resolved, that until such time as the tuberculin test of cattle is efficiently applied, we recommend the pasteurization of city milk supplies under municipal, state, or national control.

It is the second portion of this resolution, namely, that referring to the pasteurization of city milk supplies under municipal, state, or national control, that is significant. For it involves the recognition that we are con-

fronted with a condition, not a theory; that, while the universal tuberculin test of cattle is a counsel of perfection, the practical difficulties in generally introducing and efficiently controlling such a measure are still very great; that, more than this, the milk supply of a municipality is a public utility, the proper safeguarding of which is properly the function of the state. By this resolution, pasteurization is no longer a process to be left to the milk handling company, to be accomplished with any apparatus and in any manner it may elect. It is at all times to be subject to such expert control as to render the process efficient in its true sense, with the resulting destruction of the accompanying infection. It is evident that from control in this sense to the pasteurizing plant owned and conducted by the municipality is but a step.

Unfortunately, at the general meeting of the association, the opposition which was overruled in the milk section again made itself felt, with the result that the resolutions were referred to the executive committee for future consideration.

In the housing section the sinister effects of overcrowding and bad housing conditions upon the welfare of mother and child were abundantly shown. A paper by Prof. C. E. A. Winslow, of the College of the City of New York, dealt with the relation of bad ventilation to infant mortality. He showed that from 15 to 20 per cent of infant deaths are due to "bad-air diseases,"—namely, bronchitis and pneumonia—and that the distribution of infant mortality corresponds to the overcrowded quarters of the city. Yet he realized, he said, that the chief means by which we can get at the real facts, namely, accurate statistics, are lacking, and that one valuable service the association might perform would be the collation of related data by means of the workers connected with the numerous child-saving agencies which are now at work. The resolutions passed by the housing section

indicate that private and unofficial agencies can only assist in procuring improvement in housing conditions, and that the institution of deep-going reforms is essentially the province of the state.

The great English mathematician, Pearson, has shown in his studies of human mortality that, while the mortality curves of the various ages of man present well marked maxima and minima within the span of their respective periods, in the case of the infants such is not the case. If we are to find the maximum ordinate of the infant mortality curve we will not find it to be for the period subsequent to birth, but it must be sought in the prenatal period of existence.

Among other papers in the section on eugenics, Dr. Prince A. Morrow, of New York, showed convincingly the part played by syphilis in this ante-natal mortality of infants, for syphilis is the only disease ever transmitted with its full virulence to offspring, either killing them outright or blighting their development. When the father alone is infected 30 per cent of the children perish and when the mother is diseased the mortality averages 60 to 80 per cent. Moreover, congenital syphilis, even when not immediately fatal, predisposes to disease; for the chances that a syphilitic will contract typhoid fever are nearly two and one-half times as great as for the non-syphilitic; for measles three and one-half times; for diphtheria, seven times. Thirty per cent of children with tubercular hip-disease, 40 per cent of the cases of gastro-enteritis in infants, and 60 per cent of the cases of tubercular meningitis are syphilitics. So, while it is doubtful that haphazard methods of human reproduction can be replaced by scientific selection, still, in the elimination of the "social diseases," namely, syphilis and gonorrhoea, we have a powerful means of eugenically benefiting the human race.

Issue might well be taken with the preamble to the resolutions passed by this section, which states that "under present conditions the efforts for infant conservation must necessarily work some anti-eugenic results." This statement rests upon the supposition that, as the human race is eugenically served by the elimination of the unfit, and since the conservation of infant life results in the preservation of many, presumably weaklings, who would otherwise perish, the interests of eugenics and those of the pre-

vention of infant mortality are conflicting. In this presumption, however, the fact is lost sight of that, while under natural conditions the elimination of the weakling makes for a higher standard in the survivors and their offspring, under modern living conditions, on the contrary, we have to deal with an essentially man-made and therefore artificial environment which results in the indiscriminate elimination of both the strong and the weak without bringing them into natural competition with each other. Moreover, under these adverse conditions, while the weakling is almost immediately exterminated, the originally strong may survive, but survives as a weakling. If, on the other hand, we prevent undue infant mortality by improved social conditions, the originally strong remains strong and tends to mate only with the strong, while the weakling is eliminated by a process of natural selection. From this standpoint the movement for the conservation of infant life will produce anything but "anti-eugenic results."

Another phase of ante-natal and intra-natal mortality was dealt with in the section on midwifery, namely, the practice of obstetrics, especially by midwives, and its relation to the mortality of infants. Not only the midwife but the medical practitioner also became the subject of investigation. Dr. J. Whitredge Williams, of Johns Hopkins University, presented a paper which was the result of the circulation among the professors of obstetrics at medical schools throughout the country of a questionnaire containing some fifty queries concerning obstetrical education and the midwife problem. The analysis of the answers received showed a most deplorable condition of affairs. The medical schools were found generally deficient in clinics, in the qualifications of the obstetrical teachers themselves, and in the hours devoted to the study of obstetrics. The students leave improperly equipped to practice obstetrics, and they do not repair this default later. One-half the answers state that ordinary practitioners lose as many women from puerperal infection as do midwives, while three-fourths of the answers indicate that more annual deaths result from obstetrical operations improperly performed by practitioners, than from infection in the hands of midwives. Dr. Williams concludes that reform is urgently needed and can better be effected by a radical improvement in

medical education than by the almost impossible task of greatly improving the status of midwives.

Dr. Huntington, of Boston, read a joint paper by himself and Dr. Emmons in which it was shown that, by the extension of outdoor obstetrical facilities by lying-in hospitals, the midwife, as a problem, has been practically eliminated in Boston, less than 1 per cent. of the women in that city being delivered at their hands. He also pointed out that in Germany, where midwives are subjected to close and intelligent supervision, backed by a police power more stringent than can be exercised in this country, the status of the midwife question is far from satisfactory. Dr. Huntington concluded that as the presence of the midwife involved the existence of a dual standard of obstetrics, and as supervision of her had proved unsatisfactory both in Germany and England, she should be abolished in this country and the extension of outdoor obstetrical facilities be made to take her place.

The section passed resolutions to the effect that the teaching of obstetrics in medical schools of the United States is grossly inadequate and that no time should be lost in raising the standard; that the study of local midwifery conditions be urged as a means of collecting facts with which to direct public opinion in regard to this important subject; and, finally, that the extension of outdoor, dispensary, and hospital obstetric facilities be advocated as a most efficient means of obviating this source of maternal sickness and death and a high infant mortality rate. These resolutions were adopted at the general meeting of the association.

A diametrically opposite view prevailed in the section on Nursing and Social Work, as shown by the passage in this section of the following resolutions:

That the nursing profession extend its field of usefulness by including the practice of midwifery for normal cases. Further, that a minimum standard of training be required for all who are permitted to practice midwifery, and that all midwives be under state or municipal control.

The discussion on these resolutions, at the general meeting of the association, was very interesting, Dr. Caroline Hedger, of Chicago, speaking against the resolutions and Dr. Rachel Yarros of the same city defending

them. The resolutions were finally referred to the executive committee.

It would seem that the midwife need by no means be regarded as a necessary evil in this country. It is true that in Europe she has become entrenched by the use of centuries. The midwife in our cities is mainly employed by the foreign-born population; yet it does not therefore follow that the alien mother will not avail herself of more competent services if they are provided. The immigrant comes to this country ready to be divested of preconceived notions, and there are good grounds for the belief that, were the midwife problem to be attacked by the provision of more and better outdoor and dispensary obstetrical facilities, the midwife would very soon by her elimination cease to be a problem. This plan would also have the important advantage of furnishing a means by which mothers could be induced to bring their infants more generally to consultations for nursing, conducted in connection with this outdoor service, thus greatly increasing the number of children under medical supervision during their first year, with the corresponding reduction in the infant mortality rate always effected by such medical supervision.

The president-elect of the previous year, Dr. Avery L. Wilbur, of the Bureau of Vital Statistics, Washington, D. C., duly assumed his office, and Dr. L. Emmet Holt of New York, was chosen as president-elect. The next meeting of the association will be held in Cleveland, O.

BLINDNESS AND MIDWIFERY

Measures looking toward a solution of the problem of the untrained midwife as related to unnecessary blindness among infants was one of the special features of the past year's work of the New York Committee on Prevention of Blindness. At the annual meeting early this month, which was attended by representatives from the various groups of workers which bear upon the midwifery problem, health officers, obstetricians, ophthalmologists, pediatricists, instructors in nursing, and social workers, Carolyn Van Blarcom, executive secretary of the committee, reviewed the activities of the twelve months and presented the conclusions of the committee resulting from its midwifery investigations.

Since it is believed by the medical profession that blindness from ophthalmia neonatorum would practically never occur if the eyes of all new-born infants were properly cleansed, and if prompt and efficient medical attention were invariably administered upon the appearance of the early symptoms of this disease, it was seen that the services of midwives, who attend such a large per cent of births, bear an important relation to the prevention of blindness. Moreover, earlier studies by the committee, and by other organizations and individuals had revealed the very prevalent unfitness of midwives to practice under present conditions; illiteracy, very advanced age, ignorance of prophylactic methods, and uncleanly habits all figuring in their indictment. Obviously then, if the diseases which are estimated to be responsible for something like 10,000 blind persons in this country to-day are to be scotched in their dark ravages upon eye-sight, something must be done regarding midwifery. Two things have been attempted in various states and countries; either the absolute elimination of the midwife, or the requirement of a higher educational standard and state control.

The committee's study of elimination led to the conclusion that such a program was well-nigh impossible, the reasons, briefly, being that the large immigrant populations in America cling through custom and deeply rooted tradition to the midwife; that the midwife is an economic necessity to those whom she attends, for from her the patient is able to secure both medical attention and nursing care at a cost which does

not exceed a doctor's fee for medical attention alone; that the midwife acts not only as a visiting nurse but as a general adviser and woman friend, neither of which functions are usually expected of the doctor. Moreover, in places where the practicing of midwives has been made illegal, there have been strong indications that the law was flagrantly violated. This conclusion having been reached, the next step was a study of the results of better training and state control.

In the year just closed the committee made a study of the laws relating to midwifery training and control in sixteen European countries, together with curricula from foreign midwifery schools, and has secured opinions and criticisms from obstetricians, midwives, and public health workers in these countries. Through the New York state Department of Health, copies of laws, acts, and ordinances providing for state, county, or municipal control of midwives in the United States have also been collected. It was found that in thirty-three of the forty-nine states and territories there is no law restraining the practice of midwifery. In three midwives are actually allowed by law to practice unrestricted; while in the remaining thirteen states there are laws purporting to require examination before licensure to practice, although there is a total absence in these states of adequate provision for midwifery training.

By an act of parliament entitled "An act to secure the better training of midwives and to regulate their practice," a Central Midwives Board was established in England in 1902, and the supervision and control of midwives was placed under it. The seemingly successful working of the law, and the fact that conditions in England before the passage of the Midwives Act were closely similar to those existing in New York to-day, led the committee to commission Miss Van Blarcom to visit England during the late summer, for the purpose of making a detailed study of the workings of the act. This investigation included a study of the legislative history of the act; the power and organization of the Central Midwives Board, its method of examination, licensure, and control of practicing midwives; the training of midwives carried on in hospitals and out-patients departments, and by physicians and certified midwives; and a study of the administrative methods of local health officers,

together with records of the work done by midwives under their supervision. These various aspects of the midwifery work in England were studied in cities and towns of various sizes and in rural districts, and among midwives and inspectors of varying grades. Both midwives and inspectors were frequently accompanied on their rounds, thus affording an opportunity for close observation of their practical work.

In her report Miss Van Blarcom states:

"The impressions received during the six weeks devoted to this study were very convincing. There seemed little room for doubt that in England the training and intelligent supervision of midwives in their practice exerts a powerful influence toward the preservation of life and health of mothers and babies. Better medical attention is secured for this class of the sick poor, and in a larger number of cases than in the old days when the "Gamps" held sway uncontrolled. Not only have maternal and infant mortality declined, but in the opinion of many obstetricians and public health authorities in England the morbidity of mothers and babies has been reduced at least partly as a result of the better medical and nursing care secured through the administration of the Midwives Act."

The committee believes that there is a very necessary function for midwives to perform, and that the fact that thus far they have not adequately measured up to that function is not a more logical reason for their elimination than for their elevation through education and proper state supervision. The deplorable status of the midwife in this country seems to reflect discredit upon the American public rather than upon the profession of midwifery itself. Just as recent investigations showing the failure of obstetricians to produce the kind of results that may be reasonably expected have led physicians and others to recommend not the elimination of obstetricians but better standards of education for them; so the committee would urge the education and state control of midwives, not for the sake of encouraging them to encroach upon the medical profession, but rather to fit them to give nursing care to their patients, and by virtue of their training to recognize symptoms of abnormalities and secure adequate medical attention. As the standard of the midwifery profession in England has been raised, the percentage of cases in which midwives have summoned medical assistance has increased proportionately. It would seem that the better medical and nursing care thus insured would operate strongly against unnecessary blindness and other preventable maladies among mothers and babies.

The committee, in its endeavor to secure state legislation affecting the training and control of midwives, has been working in close co-operation with the New York state

and city Departments of Health, and has secured the assistance of important medical societies as well as of influential members of the medical profession. Resolutions favoring the training and control of midwives under state authority were adopted during the year by the New York State Medical Society, the Homeopathic Society of Western New York, the section on Obstetrics and Gynecology of the New York Academy of Medicine, two county medical societies, the American Association for the Conservation of Vision, the American Nurses' Association, and the American Society of Superintendents of Training Schools for Nurses. Sections or committees on midwifery have been appointed by the American Society for the Conservation of Vision, the American Association for the Study and Prevention of Infant Mortality, and the American Society of Superintendents of Training Schools for Nurses.

One tangible result of the committee's efforts to better midwifery practice in New York has been the establishment of a training school for midwives in connection with Bellevue and Allied Hospitals. The report states this to be the first school of its kind in America, and that it was opened as a result of co-operation offered to the committee by the president of the Board of Directors of Bellevue and Allied Hospitals. The school is under the immediate supervision of the general superintendent of nurses of these hospitals, and its curriculum embraces instruction in practical nursing, care of pregnant and parturient women, care and feeding of infants, conduct of normal labor, symptoms of complications and abnormalities, and the rudiments of anatomy, physiology, hygiene, and dietetics.

At the close of the annual meeting, the following resolutions were adopted by the committee:

"That this committee shall endeavor to secure legislative action which shall provide for a higher standard of education, and for the examination, licensure, registration, supervision, and control of midwives, by state and local authorities, throughout the state of New York;

That to this end the Sub-committee on Midwifery is hereby authorized and directed to cause a bill to be drafted or amendments to existing law to be prepared and introduced during the coming session of the legislature, and to endeavor to secure the enactment of such proposed legislation."

SEX EDUCATION

MARCUS M. MARKS

President Parents' and Teachers' Conference of the Ethical Culture School

We have all been giving time to the consideration of many relatively unimportant matters affecting the lives of our children. For example, the subject of table-manners has received more or less attention daily. Sex education, however, though it is one of the most important questions affecting this

and future generations, has been pushed aside and hushed, on account of a feeling of mock-modesty which is an unfortunate characteristic of our present civilization. Untold misery has already resulted on account of the ostrich-like attitude of many parents who bury their heads in the sands and have not the courage to look physical facts in the face. But men's and women's minds are now being directed to the serious consideration of the problems of sex education. The Society of Sanitary and Moral Prophylaxis has been doing excellent service in this cause, and other agencies are beginning to impress their warnings upon the public and dispel some of the false sentiment which has enveloped the subject. More enlightenment on the subject is imperative.

There are several methods of sex education, all of which, if adopted, should be used in intelligent co-operation. One is the general education of parents by physicians, the purpose being to enable parents to be the medium of the sex education of their own children. The second is education of children directly through physicians by public lectures and the dissemination of literature. The third is education of individual children directly through their family physician. The fourth is education of children directly through school teachers in connection with biology and ethics courses.

After considerable discussion the Parents' and Teachers' Conference of the Ethical Culture School adopted the first mentioned method about a year ago. A great deal of care was used in beginning the study of this delicate subject. It was deemed wise not to call the parents together in a large gathering. It was further decided, in deference to the views of those who thought it best to take no possible chance of offending the most sensitive, to have the physicians address the fathers and the mothers of the school children separately. Therefore round-table conferences were arranged for small groups of fathers on certain afternoons and evenings and for small groups of mothers on other afternoons. After an hour's discourse, usually by Dr. Ira S. Wile, a well-known expert on child hygiene, questions were asked by the parents and answered by the physician. The most intimate questions were asked and satisfactory replies given. Parents expressed themselves as being deeply interested and vastly benefited by these conferences. They are being continued with parents of newly-admitted children.

The school officially gives sex education, up to a certain point, in its physiology and biology classes; the ethics course also naturally touches on some of the problems of sex; but in neither of these courses is there that heart-to-heart touch which can be given to the child by its parent. There is, of course, no absolute rule. Each child has a different nature and a different development. The parent knows the child, but at times the teacher knows the individual child even better. Therefore the teachers of the Ethical Culture School are included in these round-

table conferences; they too, thus receive the benefit of an expert's advice and have some of their doubts removed as to the best way of approaching the subject of sex education. This article is written to report highly satisfactory experience with the method of parents' and teachers' conference in studying the important problems of sex education.

JOTTINGS

WANTED DAILY: 105 BARRELS OF AIR

Dr. W. P. Northrup of New York, the well known specialist on children's diseases, in an interesting bit of autobiography in the November *Journal of the Outdoor Life* gives some of his pioneer experiences in the fresh-air treatment of disease. Seven years ago, when he dared to go against current methods of treating pneumonia, and placed the child in the open air, he was called "crazy" and "a faddist," but when he had demonstrated, after months of labor, that fresh air was the best medicine for those suffering from pneumonia, measles, whooping-cough, and even for weak, sickly babies, balconies began to appear here and there, until now almost every large hospital in New York has open-air sleeping provisions.

In the same issue, Dr. Thomas H. Hay emphasizes the blood's constant need of oxygen, in an article on the Physiology of Fresh Air. The average amount of air taken into the lungs during ordinary quiet breathing is about thirty cubic inches at each single inspiration. At the rate of eighteen breaths a minute, there would thus pass in and out of the lungs 777,500 cubic inches, or 450 cubic feet, every twenty-four hours. With an average of seventy beats a minute, the heart delivers to the lungs for aeration five ounces of blood at every beat, or nearly 3400 gallons a day. In other words, the lungs handle in twenty-four hours 105 barrels of air and 125 barrels of blood. "In view of the stupendous task which the respirating apparatus has to perform," says Dr. Hay, "the necessity of a supply of absolutely pure air becomes apparent." Dr. Thomas S. Carrington, writing on Fresh Air in the Home, unites with Dr. Hay in declaring that the superstitious prejudices against night air and draughts are absolutely without foundation.

The January issue will be the first of two numbers dealing expressly with the specific treatment of tuberculosis, and will contain three main articles by specialists of wide medical experience and recognized authority.

WATCH THE BAKERIES

The New York City Board of Health, at one of its meetings the latter part of November, issued nineteen public nuisance orders and eleven vacation orders against premises occupied as bakeries in Brooklyn. These orders are part of a program of the department to supervise all places in the city where food is prepared and sold. Several of these orders were a result of investigations made recently when the commissioner personally accompanied the inspectors on a night tour of certain bakeries in Brooklyn.

INDUSTRY

WHAT THE GOVERNMENT FOUND WHEN IT BROADENED OUT ITS INTEREST IN BOLL-WEEVILS AND BEGAN TO STUDY CHILDREN

MARY BROWN SUMNER

The following bits of life give glimpses of reasons why children leave school to go to work, the subject of Vol. VII¹ of the Federal report on women and child wage-earners.

Two children, eleven and thirteen years old, were found working in the mill. Their mother, a widow, worked there also, and so did the two older children, aged sixteen and eighteen. The mother was up at three o'clock in the morning, did the cooking for the family, and left cold victuals prepared for her very youngest—two little ones still under eleven years who were supposed to go to school, but were in reality left to their own devices. Had the mother tried to live on her own earnings and those of her children over sixteen years, the weekly per capita income of this family of seven, when rent and sickness expenses were deducted, would have been but \$1.02 per week.

Cecil, aged eleven, tired of school and his father decided not to force him to go. So he fitted up a little cabin next door as a store, stocked it with groceries and candies, and left it to the boy to manage. Cecil stayed out of school a year and a half, in which time he paid off the mortgage on his store and increased the stock. He is now attending secondary industrial school, which he likes very much, and is taking in \$100 a month at his store, 40 per cent of which is profit. This he uses in increasing his stock, fixing up the store, etc. The weekly per capita income of this family with the same deductions as in the other case is \$7.11.

Seven children in Columbia, S. C., went to work because a mill superintendent gave preference to men who could bring their children to work in the mill with them. In Columbus, Ga., like company pressure was shown in one mill by its rent scale; old and new houses, one hand at work, renting at \$1.25 per room per month; new houses, two hands at work, renting at 80 cents; new houses, three or more at work, at 75 cents per room.

Edgar, a spinner nine years old, went to the cotton mill at six o'clock in the morning; attended school from one o'clock to quarter

to three, then returned to the mill until six, working fifty-one hours a week and earning \$1.90. Working and schooling at the same time, he was burning the candle at both ends. He and his sister Pamela, eight years old and already working in the mill, two poor little listless children with pasty skin and dull eyes, were sitting on the steps resting when the agent called. Edgar said he didn't know how to play, just sat still and whittled a stick. He usually went to bed when he got something to eat. The father of this family was sick and earned \$4 a week. The weekly per capita income with deductions as above was 19 cents.

These concrete examples show the range of the government's study, which covered 622 working children—269 of them girls—found in seven industrial centers distributed as follows:

Rhode Island, two; Pennsylvania, two; South Carolina, Georgia, and Alabama, one each. Two general lines of investigation were followed, namely: the reasons for leaving school, and the industrial experience of the children. The families studied were not chosen on any particular plan, but were, if we take the bureau's word for it, "in nowise different from their neighbors." Sixty per cent were noticeably intelligent, neat, capable, ambitious, and pleasant. They included 1355 wage-earners in addition to the children at work. The average income was \$10.10 per week; all but ninety-three had a male head whose average contribution was from 42 to 66 per cent of the total family income. The average contribution of the children studied in the different localities was from 10 to 20 per cent, the largest percentage being in a southern town. The average size of the families is not given. The commonest age of beginning work in the South was twelve, in the North fourteen.

Taking the home explanation—in many cases a random statement of only a part of the truth—in conjunction with the agent's study of home conditions, the three main classes of reasons for the work of children were found to be (a) poverty, (b) dissatisfaction with school, and (c) the habit of considering work the normal condition for the young as for adults. The habit is one borne in upon these low-income families by the constant sense that at any moment some part of the household support may be cut off.

Need of the child's earnings was pleaded in 359 cases. The report assumes that a per capita income of \$2 per week per

¹REPORT ON THE CONDITION OF WOMAN AND CHILD WAGE-EARNERS IN THE UNITED STATES. Prepared under the direction of the Commissioner of Labor, Washington, 1911. Volume VII: CONDITIONS UNDER WHICH CHILDREN LEAVE SCHOOL TO GO TO WORK. Prepared under the direction of Special Agent E. H. Wilkinson.

adult male (and for other members proportionately) left over after emergencies, rent, and earnings of children are deducted, is sufficient to supply the necessities of life.¹ Of these cases 186 were found to have an income of less than this amount.

In others, a present income of over \$2 represented change for the better in the family's conditions subsequent to the time the child began work. For example, a boy had gone to work during the illness of his father when the family income was practically nil. Since then, both father and mother secured work, and the per capita income was at the time of the investigation well over \$2. Furthermore, emergencies are not accounted for in the \$2 standard and no less than 426 families had been recently visited by sickness or death. One boy, for example, was working to pay off the debt for his own illness.

But, even so, there was left a fair proportion of cases of alleged necessity, which should rather be grouped under one or both of the other two main causes. These families did not, in the language of the report, "value further schooling as they did the acquisition of property—and the greater sense of independence and security arising from the possession of a financial reserve." From a general study of incomes on the \$2 minimum for comfort basis, the report finds 250 cases—sixty-four more than named this cause—where need must have been one cause of the child's work. In the analysis of incomes the report brings out many interesting things. One of these is the small percentage of fathers who shirked work (2.8 per cent), or who deserted their families (2.3 per cent). One hundred and seven mothers supplemented the family income by their work, but only thirty-two of these were widows. The remaining sixty-one widows had apparently chosen to have their children work for wages rather than do so themselves.

Dissatisfaction with school, or preference for work—the same thing in another form—was given as the cause of leaving school by 221 children. In 60 per cent of these necessity could not have been a subsidiary cause. In some places, as in Plymouth, Penn., the "intense hatred of some of the children for school was startling." Some light is thrown indirectly on this hatred by the fact that at Hazelton, Penn., and at Columbus, Ga., where a good system of manual training prevailed, only a small proportion left for this reason; whereas in Plymouth the school course was particularly stereotyped and academic. Taking all places together, over one-fifth of the children said they would have remained in school if manual training had been offered. Retardation accounts for some of the dislike

¹This digest does not attempt a statistical review of the bureau's report. In the discussion of family income it is a trifle disturbing to find a bibliographical footnote referring to various magazine sources, but no reference to Prof. Chapin's volume, *Mrs. Moore's Wage-earners' Budgets*, Miss Byington's *Homestead*, or to the recent British Board of Trade reports; that is, the titles making up our present literature on the cost of living.

for school, over 83 per cent of the whole group of children being older than their classmates. This cause was particularly noticeable in Pawtucket, R. I., where the children of French Canadians are at a disadvantage because of their ignorance of the language.

In the South alternation of work and study is so common up to twenty years of age that the belated child is not so noticeable; he is one of many. Three-fourths of all the children studied left school below the seventh grade; 47 per cent below the fifth, and 27 per cent left school at the age of fourteen, below the sixth grade. Sixteen children could not read nor write, and 163, or almost one-quarter of the total number, could speak, read, or write English either not at all or very little. Thus, though whim probably accounts for a certain percentage of those who leave school because they dislike it, retardation and the lack of a course adapted to their needs appear to be the two most important causes.

Fourteen per cent gave as their reason for going to work that it was the normal thing to do. "Why shouldn't he work? He's of age," said one mother. The facts that 192 fathers and 217 other members of families were each unemployed for an average of one hundred days in the year, and that 426 families had to bear expenses for illness and death, taken with the fact that "there is a strong and steady demand for young workers," give impetus to this tendency to expect children to work. Besides those parents who voiced this view toward work for their children, it was undoubtedly in the background in many cases where another reason was given. It may account for many of those who spoke of necessity that was not apparent to the investigators, as well as for those who let their children drop out of school with no particular complaint to make. With the families of many unskilled laborers, whose wages at best are low and who have little chance to lay by for a rainy day, it is by itself and of itself sufficient grounds for putting their children to work, without casting about for any other reason or explanation.

These are the main causes assigned by the government's staff as to why these children, described as an average group, dropped out of school and into the work of the world. Their industrial experience is also representative of that of vast numbers of other American working children of the current decade. Few of them found that they had any need of more schooling for their "chosen work." The nature of this "choice" was interesting, as only seventy had really planned out and been able to put in effect a plan by which their work might be educational and give them a skilled trade later on. The majority drifted into "the first thing that offered" or "something near home," and this was in many cases from no lack of ambition, for 50 per cent had definite ambitions; 25 per cent attended night schools in the hope of getting somewhere in the world, and fully 44 per cent desired such training. Many of them could not get it. Lack of opportunity, or lack of knowledge

of opportunities, seems to have been the causal factor why these and no doubt many others drift into the mill, the mine, or the work of running errands. The majority will in all probability never—through their present work, at any rate—get the opportunity they desire. A would-be turner of fifteen was working as cleaner in a mill; a mill hand of fourteen wanted to be a farmer; and a fifteen-year-old door-tender in a mine, "working in solitude and darkness at as uninteresting and mechanical a task as the mind of man can conceive," longed to be an electrician.

Only 3 per cent of these children were working at occupations in which the maximum wage was \$15 or over, 90 per cent were in trades where adults earn less than \$10. The children's opportunities for advancement without a change of employment were slight, and in many cases advancement in pay ceased automatically at sixteen years, showing that the work was schemed for children alone, giving no opportunity for educational or financial growth—the dead-end occupations which

blight youth. Five hundred and twenty out of the 622 children received less than \$5.50 a week, 374 out of the 520 received under \$5. Few of the children—less than 4 per cent—worked less than nine hours a day; half of them worked ten hours or over.

In spite of long hours and deadening work a good half of these children were, as has been said before, ambitious, and all but 15 per cent had an interest in life, if not in their work. This 15 per cent, however, had neither interest nor desire to live. They were of the type of Edgar and Pamela, or the laundry worker of fifteen, who was "too beat out for to be amused when she gets home after her day." As Edgar and the other half-timers burned the candle at both ends, so does this girl. She does the family wash on Saturdays (the off-day of a commercial laundry) and irons the home clothes in the evenings. No wonder that she "has grown weaker and paler since she began work" and that she wants "to get to bed as fast as she can, and hopes she will die soon."

SOME METHODS IN SAFETY ENGINEERING¹

III

GUARDING PUNCHES, PRESSES, ROLLS, AND GRINDING WHEELS

JOHN CALDER

GENERAL MANAGER REMINGTON TYPEWRITER WORKS, ILION, NEW YORK.

Punch and press machinery probably rank next to woodworking tools in frequency of accident, though usually the operative escapes with less serious injury. The mechanical engineer cannot be too careful in seeing that these tools are in good repair, particularly the actuating gears. Automatic roll-feeds, sub-presses, magazine, hopper, gravity slides, Fig. 1, and push slides feeds, Fig. 4, have done a good deal to eliminate the dangers of feeding such presses by hand, but much work already blanked must still be handled in this way in subsequent punching and pressing operations.

The increasing use of compressed air in mechanical industries permits of light pieces being blown off the die at the end of the operation by a cam-operated blast properly directed and timed, Fig. 4. The ordinary spring ejector serves the same purpose for heavier work. Yet there are many punches and presses running today without the efficient safeguards here illustrated, and even where they are to be found the principles are not carried out consistently at all necessary places.

Fig. 4 is an example of a convenient fly-wheel guard, ordinarily locked in position, which the author arranged for a large series of small bench power presses worked by females. Provision is made in it for the tool

setter having ready access for moving the flywheel by hand without detachment of the safeguard and resulting failure to replace it. The work in this machine is fed in by a push-slide and removed by a cam-actuated air-blast. Figs. 2 and 3 show two forms of press guards, screen and bar respectively, which are timed to descend upon the operator's fingers, if in a position of danger, and secure their withdrawal before an accident occurs.

HAND-FED ROLLING AND GLAZING MACHINERY.

The third class of special apparatus essentially dangerous at the operating point is hand-fed rolling machinery of every description. A few of the safety suggestions which can be contributed by the mechanical engineer for this accident risk are illustrated in Figs. 5 to 10. At powerful hand-fed pressing and calendering rolls the injuries are usually very severe.

In the case of a single pair of large rolls, such as are used for paper glazing, Fig. 5, comparatively thin sheets of material are fed in, and it is possible, by having the feed-table level with the top of the lower roll and placing a bar, plate, or screen across the bottom of the upper roll, to guard effectively the dangerous intake by arresting the operative's hand when accidentally traveling towards it on the work. Fig. 8 shows this plan applied to rolls used for burnishing sheet metals. In Fig. 6, hinged guards, preferably of mesh-work, are used where the in-

16. Releasing Grindstone Rest

take of the rolls must be at all times visible and instantly accessible. The fixed forms of roll guards, however, wherever possible, are the safest.

It is found in practice that the chance of accident from hand-fed vertical rolls is considerably reduced when a feeding-table is used which keeps the operator at a safe minimum distance from the roll intake and necessitates a conscious effort to reach it. When rolls are operating on plastic materials, for example, in color-mixing and baking machinery, easy access for cleaning and scraping the rolls is essential, and a suitably placed rod attached to the top roll housing and rising and falling with it takes the place of the plate and mesh-guards already illustrated.

In laundry and cloth-finishing machinery such forms of protection are not practicable on the rolls, owing to the nature of the work. To meet such cases a light, smooth, auxiliary hardwood roll, Fig. 7, is substituted as a guard. It is pressed constantly against the main rolls by springs and is driven by them, but it fills the dangerous intake and arrests any part of the hand accidentally traveling towards the latter and in danger of being crushed.

In compound power-fed rolls with continuous webs of work, such as heavy paper and cloth-calendering machines, multiple floating guard-rolls as above described, Fig. 9, can be used, controlled and released by a system of levers whenever a break in the web necessitates restarting by hand-feeding. Fig. 10 shows a method of starting in by hand the feed of a cloth-calendering or similar web-pressing machine. A counter-balanced beveled board is used which ordinarily swings up and out of the way. With this the operator can with perfect safety push the cloth or other web home till it is gripped by the rolls.

EMERY AND OTHER GRINDING WHEELS.

Emery wheels, grindstones, and other abrasive tools when over-speeded or when strained or shocked while in motion within the limits prescribed by the makers sometimes burst with great violence and spread death and serious injury in the path of their flight. Various methods for confining the wheel fragments to the machine casing or at least rendering their velocity harmless have been worked out, and some of these are illustrated in Figs. 11 to 16. In all of them ample side clearance between the wheel and its casing is a primary requisite.

Fig. 11 shows the method of safely mounting the wheel and avoiding all initial stress due to wedging, keying, and driving it into the spindle. Fig. 15 is the cone-sided wheel so shaped that fragments due to a fracture starting at the wheel center cannot escape beyond the washer plates. Figs. 13 and 14 show various forms of armoring successfully used to retain fractured wheels on disc and face grinders.

December 16, 1911.

Fig. 12 is especially armored for large wheels subject to shock. It has hinged sides of plate steel and a strong cast-steel front guard, also hinged. The guard as a whole can slide parallel to the plane of the wheel to take care of reducing diameter due to wheel wear and the hinged front guard can be dropped to meet the same condition. Whels have been tested to destruction under all the guards illustrated without projecting fragments. Fig. 16 is a form of releasing grindstone rest which prevents accidents due to tools catching between the usual fixed rest and the stone.

JOTTINGS

A BUSINESS MEN'S GROUP

From a desire to see in practice the business ethics for which its society stands, the Business Men's Group of the Society for Ethical Culture was started last year. It has just issued a report of its year's work and a program of some intended activities. As described in *THE SURVEY* for December 31, 1910, this group "is an outgrowth of the ethical philosophy which, briefly put, teaches that the individual born into this world is surrounded with social duties; that these duties center in the paramount obligation to aid in the harmonious, all-embracing development of human society; and that the performance of these duties constitutes the chief object of existence."

This is the group's own statement of its objects:

"(a) To collect information on the best methods of improving industrial and business conditions and establishing right relations between employer and employe; (b) to inform the members of the group, to provide expert advice, and to put into practical operation the most practical things needed."

Says the report:

"The work of the group during the year 1910-1911 was elementary. First, a series of lectures was given by men and women prominent along various lines of industrial betterment. Secondly, the appointment of an expert in methods of industrial betterment as advisory secretary gave the group a unified and permanent character which it would not otherwise have had.

"As a result of this work some of the members have made definite beginnings in their own plants. In one factory a novel and successful library has been installed, another has adopted the suggestion system to the mutual benefit of employer and employe. Still another employed a woman of superior training to take charge of the female employe, etc.

"During the year 1911-1912 the group offers a series of lectures by the best authorities who can be secured. In addition to the lectures, the executive committee, together with a limited number of persons who are especially interested, will meet regularly each month. These meetings will be held as informal

round-table discussions, not only to consider the previous lectures, but also to discuss problems raised by members of the group."

LABOR NEWS LETTER

The weekly *News Letters* of the American Federation of Labor during November reported among other things that the membership of that body has reached the high-water mark of 1,756,735—an increase within the year of almost 200,000.

—At the recent Atlanta convention an exhibit in behalf of union label goods showed collars and cuffs, neckties, ladies' underwear, men's underwear, hosiery, knit goods, children's wear, and jackets.

—On March 1 a new law goes into effect in the city of Boston under which municipal laborers can be retired at half-pay after twenty-five years' service, if they have reached the age of sixty. Retirement at seventy is to be compulsory.

—The telegraph operators of the Southern and the Baltimore and Ohio Railways have come to an amicable agreement with the railway officials by which the employes of the Southern are to receive a wage increase of 12 per cent with fifteen days' vacation; of the Baltimore and Ohio, an increase of 6 per cent and a reduction in hours.

—The United Textile Workers' Association has taken steps toward affiliation with the American Federation of Labor.

—At a recent convention of Baptist ministers in Duluth a resolution was adopted in favor of a minimum wage of \$700 a year for unmarried, \$900 a year for married ministers.

GERMAN UNION CONDITIONS

A review by Hans Schlinger (*American Federationist* for December) of wages and hours of labor since 1905, compiled by the general commission of Trade Unions of Germany, contains the following table of wage increases:

Groups of Trades.	Number of persons affected.	Total amount of increase per week.	Average amount of increase per person per wk.	
			Marks	Marks
Building trades	396,489	1,100,543	2.78	
Metal trades	125,560	171,099	1.36	
Printing and kindred trades	10,332	15,185	1.47	
Wood working trades	96,114	178,210	1.85	
Food and drink trades	42,504	72,014	1.59	
Clothing and textile trades	66,541	113,630	1.71	
Transport and retail trades	41,213	87,523	2.12	
Other trades	66,816	107,112	1.60	

The large increase in the building trades is mainly the result of an agreement following a great lockout in those trades. It is interesting to note in this connection, that, taking all trades throughout this period of time, 73 per cent of the people whose wages were increased had not been locked out nor

on strike. In some cases peaceful negotiations ended in increases, in others several groups profited by the strike of one. The average number of hours' increase in the trades affected is three and one-third. The number of people affected by wage increases in 1910 is 829,376, by reductions in hours 345,684—in both cases the largest number in any single year. The majority are trades unionists.

CHICAGO STENOGRAPHERS ORGANIZE

The *Union Labor Advocate* reports the organization of three hundred girls in the Chicago local of the Stenographers' Union. They are aiming at "ten thousand members within a year, and a minimum wage, after one year's experience, of \$12. Other features of the union are a free employment agency, a night school in subjects bearing on their work, physical culture classes, a free medical bureau conducted by women physicians, and a fund for out-of-work pay.

NEW YORK MERCHANTS' ASSOCIATION

The annual report for 1910 of the Merchants' Association of New York, just issued, brings out the part of this association in bringing the express strike to an end last year. Another activity, in which the express companies and indirectly the cost of living are involved, were the steps taken by the association leading up to the express rate conference and ultimately to the thorough investigation by the Interstate Commerce Commission now going on. Locally the association has taken an active part in the movement for fire prevention, for the extension of the subway system in New York city, and for the protection of New York harbor against pollution from untreated sewage.

WISCONSIN BAKE-SHOP RULES

John B. Andrews, secretary of the American Association for Labor Legislation, calls attention to an error in a paragraph published in this department in *THE SURVEY* for November 18, criticizing the Wisconsin "Bake Shop Rules. The provisions criticised as omitted from the rules are all provided for in the statutory law on the subject. Sections 1636-61 to 1636-67 of the Wisconsin Statutes include provisions in regard to water-closets, sanitation, cleanliness, and the use of cellars as bakeries. In addition, to operate a bakery in Wisconsin it is necessary to procure a license, and the law gives detail specification as to necessary sanitary requirements before the license may be given. "While the Wisconsin Industrial Commission may not be the final word in this field," writes Mr. Andrews. "I think we all feel that it is at least a step in the right direction."

A COOPERATIVE MINE

A recent issue of the *United Mine Workers' Journal* tells of a mining company formed by trade unionists in alliance with the Farmers' Union. All shares are owned by unionists; coal will be mined and hauled by unionists, and sold to unionists alone. The company is named the State Coal Company

and capitalized at \$200,000. The mine, which is situated at Erie, about seven miles from Louisville, undertakes to furnish fuel on twenty-year contracts at less than current rates. Years ago John Jarrett wanted the Amalgamated Association of Iron and Steel Workers to own and operate a plant, so that in their bargains with the big employers of the trade the unions would know the truth as to market conditions and would also know more of the employers' administrative difficulties.

NATIONAL EMPLOYMENT EXCHANGE

The second annual report of the National Employment Exchange (New York city) shows a deficit of \$9,699.46, which is about \$1,000 less than that of the preceding year, notwithstanding that both mercantile and manual departments have been moved, the latter to a much more expensive headquarters. The mercantile department shows the most tangible results as compared with last year, 1331 persons having been placed, as against 537 in the nine months covered in the preceding report, and, with 25 per cent less loss. In the manual department the actual number placed, 2398 men, is proportionately smaller than those placed, 4120, in the previous sixteen months of its existence. In general the exchange reports a difficult labor market, from its standpoint, as "during the winter months, orders for men were lacking and the unemployed were sadly abundant, and when in the spring work opened in the canal and elsewhere employers did not need assistance in finding men." Last year the majority of laborers were placed in contract groups. This year the exchange has undertaken the far more difficult and expensive task of placing single men, and a whole floor has been equipped as a waiting room—a "morning market"—where employers and men can meet.

THE AMERICAN MINING CONGRESS

At the session of the American Mining Congress this fall in Chicago the scope of the congress was widened so as to include coal operators as well as the men interested in metal mining. In the course of the organization's efforts for the establishment of the National Bureau of Mines, the co-operation of coal mining men was secured, so that the demand could be pressed in the name of the entire industry. The merger of the branches of the industry was a natural outgrowth of this associated activity. The congress endorsed legislation for just workmen's compensation and called upon the national and state governments for its enactment. A movement was started to secure federal appropriations for the maintenance of mining schools in the several states analogous to those for agriculture. The strengthening of the work of the bureau of mines was urged, including increased appropriations for experiments and the life-saving work of the bureau and for experimentation in the reduction of low-grade metal ores. The practice of "shooting off the solid" in coal mining was condemned, not only because

it increases the amount of fine coal, which is of little relative value, and requires the use of more powder, but also because it greatly increases the liability of "blown-out shots," which are destructive of life and property. This practice is prohibited in every European mining country, the law requiring that the coal be either undercut or sheared at the sides by hand or machine; but save in those American states which have recently legislated against it, the method is extensively used in the United States.

MIGRATORY WORKERS' UNIONS

In his address before the Atlanta convention of the American Federation of Labor, President Gompers reported progress on the resolution of the last annual convention, demanding the organization of migratory laborers, which was followed some months later by Andrew Furuseth's vigorous circular letter on the subject. President Gompers reports that he has himself investigated migratory labor on the Pacific coast and believes that, especially in view of probable increase of immigration to that part of the country with the opening of the Panama Canal, it would be well to establish a department for migratory workers in the American Federation of Labor. Austin Lewis, writing in the *International Socialist Review*, reports that since Furuseth's letter the United Laborers' Union has come into existence and is already affiliated with the federation. By far the largest and strongest organization of this character is, however, that of the Industrial Workers of the World, which is made up of lumber jacks and "blanket stiffs"—the typical migratory workers.

MINIMUM WAGES FOR TAILORS

The *London Daily News* reports that the British Minimum Wage Boards are at work fixing rates in a fourth sweated trade, tailoring. In chain-making and lace-finishing the new rates are in actual operation, and in paper-box making scales have been arranged. The present proposals of the Trades Boards would give a minimum of 14s. 10d. a week for women, 25s. 6d. for men. The vast majority of women tailors to-day receiving less than that. About a quarter of the women employed in shops are earning less than 10s; those employed at home-work earn still less. The rates fixed in the earlier industries affected only about 40,000. The rates in the tailoring trade will affect several hundred thousand.

THE RICHMOND VOTE

The labor papers feature, as the striking event of the recent convention of the American Federation of Labor, the resolution introduced by the United Mine Workers' delegates, demanding the resignation of union men from the National Civic Federation. The resolution was defeated by a vote of 11,849 to 4,559. This minority vote is regarded by many as a gauge of the radical and socialist elements in the labor movement.

SOCIAL AGENCIES

THE GROWTH OF THE BERRY SCHOOL IDEA

MARTHA BERRY

FOUNDER AND DIRECTOR OF THE BERRY SCHOOL, MOUNT BERRY, GA.

Next month the Berry School celebrates its tenth anniversary. It will be a homecoming time for the thousand boys who have gone back from this school to the country districts of Georgia. It will of course be a season for stock-taking on the part of the friends and graduates of the institution, so that the institution itself may continue to be an experiment station for further pioneering in meeting the educational needs of the neglected rural districts of the southern states. For, after all, the work this school has been able to carry forward among the poor boys and girls who have come to it is only part of the story. Its influence in leading the southern commonwealth to take up the educational needs it has revealed is of wider significance and is of more direct public concern. The state of Georgia has established eleven schools modeled after the Berry School. Visitors come from all parts of the country and we show them our schedule and our methods of grappling with problems we are endeavoring to solve. These are helpful to them in their own fields of endeavor. Schools in Virginia and the Carolinas have followed the Berry model.

Anniversary day, January 25, will be a time for re-telling the story of our beginning. Twelve years ago I was spending a Sunday afternoon for rest and recreation at my home place in the mountainous northwest of Georgia. Some small white children were wandering in the woods. They were poor and neglected.

THE SEED.

In this Cabin the first class was held.

receive an elementary education, be trained in useful arts and crafts, and come into personal contact with people of large vision and enthusiasm. It was up-hill work, but I set myself to the task of teaching those who came to the school how to read and how to work. It was no easy matter to get these children of the mountains to come with clean hands, and I resorted to a little stratagem. I brought a microscope that I had formerly used in botanical work and invited them to examine their finger nails under the glass. The result was that they soon began to vie with one another in having the cleanest hands and the neatest nails. In this, as in many other ways, I endeavored to inculcate the lesson of self-respect. Contact with these children of the poor white "renters" showed me that there was excellent material to work upon. They had none of the advantages enjoyed by the off-spring of the well-to-do.

I found here a hitherto untilled field and

To my inquiry, "What do you do on Sunday?" I received the answer "Nothing." Further questioning brought out that they had many brothers and sisters—in some cases as many as ten. I said that if they would come to this place next Sunday, I would tell them some stories from the Bible. They came, with their brothers and sisters and in some cases their parents.

My experience with this Sunday school work showed me the urgent need for a day school where these little children could

determined to open the door of humanity to these ignorant and neglected children, in order to make them workers and participators in human activities, lifting them up and teaching them not to lean on others but to be self-supporting and self-respecting members of the community.

Soon after this work was begun, I started a day and Sunday school at Possum Trott, in which I had the assistance of a teacher. I afterwards opened several other small schools in various parts of the county. After two years' experience in this work I realized that the great need was for an industrial school, where children could be taught to work and come under the influence of cultured men and women.

Failing to interest my friends in this project, I went one day to a safe deposit box and took out a deed that had been given to me by my father when I was twelve years old. To a board of trustees I deeded the small school-house in which this work began, a dormitory that I had erected at a cost of \$2,000, and 150 acres of land, part of my heritage. My purpose was to give these poor white boys of the mountains an opportunity to gain a good education, and in turn to become teachers among their own people, pointing the road to improvement and uplift. My aim has been to introduce such a *morale* among the students and teachers alike that they shall carry out the high ideals on which this work was founded and built up. In a word, I have

striven to teach children in an industrial boarding school, amid elevating environment and in a Christian home atmosphere, how to live, work, and study, and how to make their own homes better and brighter places to live in. With a friend who volunteered her services for a year, I left my home and went to live in this industrial school.

At first we had only boys, about whom I learned much from a study of their habits and modes of thought. One washing day, I remember, none of them wanted to do the washing until I told them that I would have to do it myself if they did not. Then they cheerfully started in and took pride in doing the work well. Similarly in all departments I have found that the way to get boys to put forth their best effort is to kindle their pride in efficiently performing whatever task they have in hand.

The school thus started with 150 acres of land has now 2000 acres and a plant valued at \$200,000. There are now two schools, one for boys and one for girls. Scientific agriculture, farming, fruit culture, stock raising, and dairy work, as well as building and road making, are taught in the boy's school. The students do all the cooking, laundry, and housework required. The primary aim in the instruction of the girls is to make them home-makers. They are taught the scientific management of the home, the care of children, nursing, cooking, laundry work, gardening, weaving, and basketry.

A STUDENT.

Using yoked oxen to haul cans made at the school to the market.

We have now 200 boys and twenty teachers. In the girls' school, located a mile away, there are seventy-five girls and four teachers. In addition to other studies and useful arts they are taught to raise vegetables and do dairy work, such as making butter. We have also a settlement school, with fifty children. These are taught nursing, a most useful thing because of long distances from doctors and hospitals in that section of the country.
